McLennan; cost, $3,251; signed, June 20; filed, June, 23; payments, $1,200 lot enclosed; curb set, and filling about base of monument completed; $1,238, completed; $813, 35 days.

Dwight Way near Ellsworth, Berkeley. Two-story house; owner, N. S. Trowbridge; contractor, G. A. Embury; cost, $2,600; signed, June 9; filed, June 10; payments, $600, frame up; $600, brown mortar on; $600, completed; $800, 35 days.

Eighth near Oak, Oakland. Two-story frame; owner, F. B. Joseph; contractor, J. C. Whalen; cost, $2,805; signed, April 18; filed, June 9; payments, $965, enclosed; $965, brown mortar on; $965, completed.

Fourteenth near Adeline, Oakland. Two story frame; owner, John R. Hodge; contractor, F. A. Brown; cost, $1,445; signed, May 31; filed, May 31; payments, $361.25, frame up; $361.25, brown mortar on; $861.25, completed; $361.25, 35 days.

Fourteenth near Broadway, Oakland. Bank building; owner, Home Savings Bank; architects, Walter J. Mathews; contractors, R. & J. Smillie; cost, $24,895; signed, June 14; filed, June 14; payments, $2,624.46, one-seventh, completed; $2624.46, two-sevenths completed; $2,624.46, three-sevenths completed; $2,624.46, four-sevenths completed; $2,624.46, five-sevenths completed; $2,624.46, six-sevenths completed; $2,624.46, completed; $6,123.75, 35 days.

Fourteenth and Broadway, Oakland. Bank building; owner, Home Savings Bank; architect, W. J. Mathews; contractor, V. L. Eertin; cost, $21,993; signed, June 7; filed, June 16; payments, $2,749.12, ⅛ work completed; $2,749.13, ⅛ completed; $2,749.12, ⅛ completed; $2,749, ⅛ completed; $2,749.12, 5-6 completed; $2,749.13 completed; $498.25, 35 days.

Fourteenth and Broadway, Oakland. Iron work; owner, Home Savings Bank; architect, W. J. Mathews; contractors, Western Iron Works; cost, $7,125; signed, May 30; filed, June 2; payments, $1871, ⅓ iron and steel work completed; $1871, ⅓ completed; $1,871, entirely completed; $1872, 35 days.

Fourteenth and Broadway, Oakland. Marble work; owner, Joseph Macdonough; architects, Mooser & Cuthbertson; contractors, Cal. Gas Fixture Co.; cost, $1,470; signed, May 9; filed, June 2; payments, $490, goods delivered; $490, completed; $490, 35 days.

Fourteenth near Washington, Oakland. To build; owner, George Uhl; architect, Walter J. Mathews; contractors, Remillard Brick Co.; cost, $2,970; signed, June 16; filed, June 16; payments, $1,000, brickwork up to 1st floor joists; $1,200, brickwork finished; $750, 35 days.

Franklin near Durant, Oakland; Three-story frame; owner, Y. W. C. A.; architect, Chas. Mau; contractors, Herbst & McLeod; cost, $11,061; signed, June 17; filed, June 21; payments, $2,000, ¼ materials furnished and work done; $2,000, ½ materials furnished and work done; $2,000, ¾ materials furnished and work done; $2206.75, completed; $2,765.25, 35 days.

Franklin near Durant, Oakland. Excavation and brickwork; owner, Y. W. C. A.; architect, Chas. Mau; contractors, Remillard; Brick Co.; cost, $1,300; signed, June 20; filed, June 21; payments, $600, excavation done and foundation built, $450 chimneys up and all brickwork completed; $325, 35 days.

Fruitvale Ave., Fruitvale. To build; owner, F. Tillman, Jr.; architect, H. Geilfuss; contractors, Schutt & Kreeker; cost, $1,880; signed, June 9; filed, June 10; payments, 75 per cent. 1st and 15th day of each month as work progresses; balance, 35 days.

Fourteenth near 11th Ave., Oakland. One-story building; owners, Wilkinson & Brooks; architect, G. H. W. Deike; contractor, A. Enos; cost, $1,230; signed, June 6; filed, June 6; payments, $450, shingled; $450, brown mortar on; $330, 35 days.

Harrison and 11th, Oakland. Two-story frame; owner, Y. M. C. A. of Oakland; contractor, L. H. Long; cost, $4,172; signed, June 2; filed, June 2; payments, 75 per cent. of value of work done and materials used; June 20, 75 per cent. of work done and materials used since last payment; June 30, 75 per cent. of work done and materials used since last payments; balance, 35 days.

Hilligass Tract, Berkeley. One-story frame; owner, Mary Harmon; contractor, A. W. Smith; cost, $1,750; signed, May 31; filed, June 3; payments, $812.50, completed; $437.50, 35 days.

Myrtle and First, Oakland. To build; owner, R. Hickmont; contractors, Gardner & Boyden; cost, $3,104, signed, June 23; filed, June 23; payments, $1163.50, ½ of work completed; $1163.50, completed; $776, 35 days.

Oak Park Tract, Alameda. To build; owner, G. H. Hellman; architect, Willis Polk; contractors, C. H. Fosters & Son; cost, $2,170; signed, June 18; filed, June 21; payments, $500, sheathed; $375, walls shingled and roof on; $375, brown mortar on; $375, completed; $545, 35 days.

Oak Tree Farm Tract, Oakland. To build; owner, J. R. Hodge; contractor, F. A. Brown; cost, $1,595; signed, June 9; filed, June 9; payments, 75 per cent. as work progresses; 25 per cent., 35 days.

Pacific Ave. near Benton St., Alameda. To build; owner, David Clarke; contractor, Marcuse & Remmel; cost, $1,600; signed, April 15; filed, June 14; payments, $400, frame up; $400, brown mortar on; $400, completed; $400, 35 days.

Peralta Place, Lot 84. To build; owner, Wm. McIntyre; architect, Geo. H. Bordwell; contractors, Nickerson & Caldwell; cost, $4,350; signed, May 31; filed, May 31; payments, $900, frame up and roof and diagonal boarding on; $750, brown mortar on; $800, white mortar on; $800, completed; $1,100, 35 days.

San Antonio Ave. near Paru, Alameda. To build; owner, Sarah E. Bancroft; architects, Stone & Munson; contractors, Knox & Cook; cost, $3,791; signed, June 14; filed, June 15; payments, $710, frame up; $710, enclosed; $710, brown mortar on; $713.25, completed; $947.73, 35 days.

San Pablo Ave. and 28th, Oakland. Two-story frame; owner, W. Konecke; contractors, Leiter & Prugh; cost, $2,326; signed, June 21; filed, June 23; payments, $581.50, frame up and roof on; $581.50 brown mortar on; $581.50, completed; $581.50, 35 days.

Tenth near Jackson, Oakland. Two-story frame; owner, T. A. Crelin; architects, J. C. & E. A. Mathews; contractor, H. E. Jones; cost, $3,230; signed, June 16; filed, June 16; payments, $800, frame up and ready for enclosing; $1,100; enclosed, brown mortar on and exterior primed; $972.50, completed; $807.50, 35 days.

Thirteenth near Washinfiton, Oakland. To build; owners, J. & H. Abrahamson; architect, Chas. Mau; contractors, Rankin & Mohr; cost; $1,660; signed, June 18; filed, June 18; payments, $553.33, rough work done; $553.33, completed, $553.33, 35 days.

Twelfth near 23rd Ave., Oakland. Two-story frame; owner, L. Brand; architect, E. C. McManus; contractor, Edward D. Bassett; cost, $5,450; signed, June 20; filed, June 21; payments, $1,362, foundation laid and frame up; $1,362, brown mortar on; $1,362, plastered and all woodwork and plumbing done; $1,362, 35 days.

Union near Eagle Ave., Alameda. To build; owner, A. J. Munro; contractors, Marcuse & Remmel; cost, $2,440; signed, June 20; filed, June 21; payments, $610, frame up $610, brown mortar on; $610, completed; $610, 35 days.

Union near San Antonio, Ave., Alameda. Two-story frame; owner, W. W. Haskell; architect, C. S. Shaner; contractors, D. Straub & Son; cost, $5,337; signed, May 27; filed, June 6; payments, $1,334.25, frame up and roof sheathing on; $1,334.25, enclosed, cornice on and window frames in; $1,335.25, completed; $1,334.25, 36 days.

Wicks Addition near San Leandro. Two one-story frames; owner, J. Kerwin; architect, J. J. Clark; contractor, C. W. Collins; cost, $2,788; signed, June 6; filed, June 6; payments, $695, frame up and rustic on; $695, brown mortar on; $695, inside finish complete; balance, 35 days.

SANTA ROSA.

Brick building 100 feet by 100 feet to be used as a fruit storage and assortment house.

PATALUMA.

H. Mecham will build a $5,000 residence on his ranch. Hedges & Paff, are the builders.

RENO, NEVADA.

The Reno Gazett, Nevada, publishes a partial list of buildings in course of construction and shortly to be commenced in that town. Ed. Barber is putting up a neat little cottage. Jim Bristol is erecting a fine house. P. L. Flanigan is very shortly to commence the building of a $6,000 residence. Harry Anderson is building a $5,000 house. C. C. Powning is just putting the finishing touches on a $3,000 cottage of modern architecture. The Bank of Nevada will commence in a day or two the erection of their new two-story brick bank building. C. S. Martin is putting up two two-story brick stores. Benj. Curler, Jr., is putting up a nice house. W. F. Chapman has one just completed. Miss Moral is building a pretty little house. Julien & Fletcher will shortly commence the construction of a two-story brick. C. J. Brookins will build a one-story brick on the foundation already laid, (34x100).

These are only a few of the many improvements now going on and in contemplation, so it will be seen that Reno is at least holding her own in the march of progress.

IT is only a few years since gas began to attract general attention as an economical method of heating. The advantages in the use of gas as fuel for cooking and heating, and for warming dwellings, have been fully demonstrated. Steam boilers are now heated with gas. Rooms can be warmed by hot water circulating pipes run around the room in such a manner as to warm the coldest alcove or corner to an agreeable temperature. The hot water circulation is kept up by the application of a gas flame under a small boiler. With a more general use of gas as fuel, chimneys will not be required, thus saving a considerable expense, especially for steam boilers.

THE practice of separating the different trades and making separate contracts for each department of a building with parties who make such department a special business, seems to be extending. It makes a little more work for the architect in the beginning, but in the long run the advantages are on the side of separate contracts. Where the work is divided, the architect comes more directly in contact with the chief of that division and the work is done more in harmony with the special designs for that purpose. In some cases where experienced workmen are required, trouble has been caused by inferior work, more especially in the electric wiring of buildings, which according to the *Canadian Architect*, is in some cities included in the plumbers' specifications.

THE *Sacramento Weekly Union*, of May 27th, contains an illustration and description of the extensive manufacturing and repair works of the Southern Pacific Company in Sacramento, California, where their locomotives and cars are constructed. These shops give employment to some three thousand persons and cover an area of over thirty acres, and the grounds are laid out with plots of turf and beds of flowers, bordered with rows of eucalyptus trees. These trees were planted some years ago and are now shade trees of seventy feet in height. The grounds contain over three thousand shade and ornamental trees. Only in a place like Sacramento is it practically possible to build such workshops in a veritable garden of paradise.

The *Union* is a staunch friend to the interests that tend to build up and develop this section of the Coast. The section around and back of Sacramento is especially adapted for manufacturing. We shall touch upon this subject again in the future.

ARCHITECTS AND STEAM PLANTS.

AN engineer says: "I wonder why it is that architects, in their plans and specifications for office and other large buildings, pay such little attention to adequate accommodations for the steam plant. I have in mind a building recently completed in this city, of magnificent proportions and splendidly finished, having everything within its walls that modern ingenuity has devised for the convenience of office men, yet when the building was fairly under way and the proprietors began to look around for their steam equipment, they had to entirely change their plans in that particular, for the reason that the space allotted for the engine room would not permit them to carry out their original designs. The room was too cramped altogether, and instead of putting in one or two large engines with capacity sufficient to furnish the power required, they were compelled to place nearly four times that number of a different type of engine, small enough to fit in the small apartments set aside for that purpose. Now, isn't that all wrong? Why, it looks like some of these architects do not regard the steam plant as at all worthy of consideration in making their calculations, yet nothing is more important, for light, heat and transfer facilities are dependent upon it, and if these do not work right and give satisfaction to the occupants, the building will lose its reputation for good management, and untenanted rooms will be the consequence. The sooner this fact is recognized by our architects the better, and the sooner will they become entitled to the good regards of all those who in one way or another are interested in the efficiency and proper arrangement of the steam plant."—*Age of Steel.*

SCOPE AND HISTORICAL DEVELOPMENT OF THE SCIENCE OF "TIMBER PHYSICS."

BY B. E. FERNOW, CHIEF OF FORESTRY DIVISION.

Continued from page 65.

WHENEVER human knowledge in any particular direction has grown to such an extent and complexity as to make it desirable for greater convenience and better comprehension to group it, correlate its parts, and organize them into a systematic whole, we may dignify such knowledge by a collective name as a new science or branch of science. The need of such organization is especially felt when a more systematic progress in accumulating new knowledge is contemplated. In devising, therefore, the plans for a systematic and comprehensive examination of our woods it has appeared desirable to establish a system under which is to be organized all the knowledge we have or may acquire of the nature and behavior of wood.

To this new branch of natural science I propose to give the name of "timber physics," a term which I have used first in my Report for 1887, when, in devising a systematic plan of forestry science, the absence of a collective name for this class of knowledge became apparent.

While forest biology contemplates the forest and its components in their *living condition*, we comprise in timber physics all phenomena exhibited in the *dead material* of forest production.

The practical application of timber or wood for human use, its technology, is based upon the knowledge of timber physics, and under this term we comprise not only the anatomy, the chemical composition, the physical and mechanical properties of wood, but also its diseases and defects, and a knowledge of the influences and conditions which determine structure, physical, chemical, mechanical, or technical properties and defects. This comprehensive science, conceived under the name here chosen, although developed more or less in some of its parts, has never yet been dignified by a special name, nor has a systematic arrangement of its parts been attempted before. It comprises various groups of knowledge derived from other sections of science, which are neither in themselves nor in their relations to each other fully developed.

While plant physiology, biology, chemistry, anatomy, and especially xylotomy, or the science of wood structure, are more or less developed and contribute toward building up this new branch of science, but little knowledge exists in regard to the interrelation between the properties of wood on one side and the modifications in its composition and structure on the other. Even the relation of the properties of various woods, as compared with each other, and their distinct specific peculiarities is but little explored and established. Less knowledge still exists as to the relation of the conditions which surround the living tree to the properties which are exhibited in its wood as a result of its life functions. Suppositions and conjectures more or less plausible preponderate over positive knowledge derived from exact observation and from the results of experiments. Still less complete is our knowledge in regard to the relation of properties and the methods and means used for shaping or working the wood.

The close interrelation of all branches of natural science is now so well organized that I need not remind my readers that hard and fast lines cannot be drawn, whereby each field of inquiry is confined and limited; there must necessarily be an overlapping from one to the other. Any system, therefore, of dividing a larger field of inquiry into parts is only a matter of convenience; its divisions and correlations must be to some extent arbitrary and varied, according to the point of view from which we proceed to divide and correlate.

There are two definite and separate directions in which this branch of natural science needs to be developed, and the knowledge comprised in it may be divided accordingly. On one side it draws its substance largely from the more comprehensive fields of botany, molecular physics, and chemistry, and on the other side it rests upon investigations of the wood material from the point of view of mechanics or dynamics. In the first direction we are led to deal with the wood material as it is, its nature or appearance and *condition;* in the second direction we consider the wood material in relation to external mechanical forces, its *behavior* under stress.

The first part is largely descriptive, concerned in examining gross and minute structures, physical and chemical conditions and properties, and ultimately attempting to explain these by referring to causes and conditions which produce them. This is a field for investigation and research by the plant physiologist in the laboratory in connection with studies of environment in the forest. The second part, which relies for its development mainly upon experiment by the engineer, deals with the properties which are a natural consequence of the structure, physical condition, and chemical composition of the wood as exhibited under the application of external mechanical forces. It comprises, therefore, those studies which contemplate the wood substance, with special reference to the uses of man, and forms ultimately the basis for the mechanical technology of wood or the methods of its use in the arts.

The correlation of the result of these two directions of study as cause and effect is the highest aim and ultimate goal, the philosophy of the science of timber physics. Timber physics, in short, is to furnish all necessary knowledge of the rational application of wood in the arts, and at the same time, by retrospection, such knowledge will enable us to produce in our forest growth qualities of given character.

Conceived in this manner it becomes the pivotal science of the art of forestry, around which the practice both of the consumer and producer of forest growth moves.

The first part of our science would require a study into gross and minute anatomy, the structure of the wood, form, dimensions, distribution, and arrangement of its cell elements and of groups of structural parts, not only in order to distinguish the different woods, but also to furnish the basis for an explanation of their physical and mechanical properties. We next would class here all investigations into the physical nature or properties of the wood material, which necessarily also involves an investigation into the change of these properties under varying conditions and influences. A third chapter would occupy itself with the chemical composition and properties of woods and their changes in the natural process of life, which predicate the fuel value and durability as well as the use of the wood in chemical technology.

Although, philosophically speaking, it would hardly seem admissible to distinguish between physical and mechanical properties or to speak of "mechanical" forces, for the sake of convenience and practical purposes it is desirable to make the distinction and to classify all phenomena and changes of non-living bodies, or bodies without reference to life functions, into chemical, physical, and mechanical phenomena and changes. As chemical phenomena or changes, and therefore also conditions or properties, we class, then, those which have reference to atomic structure; as physical phenomenal changes and properties, those which refer to and depend on molecular arrangement; and as mechanical (molar) changes and properties those which concern the masses of bodies, as exhibited under the influence of external forces, without altering their physical or chemical constitution.

There is no doubt that this division is somewhat forced, since not only most or all mechanical (as here conceived) changes are accompanied or preceded by certain alterations of the interior molecular arrangement of the mass, but also many physical phenomena or properties, like density, weight, shrinkage, having reference to the mass, might be classed as mechanical; yet, if we conceive that physical phenomena are always concerned with the "quantity of matter in molecular arrangement" and with the changes produced by interior forces, while the latter are concerned rather with the "position of matter in molecular arrangement" and with changes under application of exterior forces, the distinction assumes a practical value.

Our conception of these distinctions will be aided if we refer to the physical laboratory as furnishing the evidence of physical phenomena, and to the mechanical laboratory as furnishing evidence of mechanical phenomena.

These latter, then, form the subject of our second or dynamic part of timber physics, which concerns itself to ascertain mainly by experiment, called tests, under application of the laws of elasticity, the strength of the material and other properties which are exhibited as reactions to the influence of applied stresses, and those which need consideration in the mechanical use of the material in the various arts.

Having investigated the material in its normal condition, we would necessarily come to a consideration of such physical and chemical conditions of the material as are abnormal and known as disease, decay, or defects.

Finally, having determined the properties and their changes as exhibited in material produced under changing conditions or differing in physical and structural respects, it would remain the crowning success and goal of this science to relate mechanical and physical properties with anatomical and physiological development of the wood substance.

THE SUBLIME AND BEAUTIFUL.

By Edmund Burke.

Published about 1753.

PART I.—NOVELTY.

THE first and the simplest emotion which we discover in the human mind, is Curiosity. By curiosity I mean whatever desire we have for, or whatever pleasure we take in, novelty. We see children perpetually running from place to place, to hunt out something new: they catch with great eagerness, and with very little choice, at whatever comes before them; their attention is engaged by everything, because everything has, in that stage of life, the charm of novelty to recommend it. But as those things, which engage us merely by their novelty, cannot attach us for any length of time, curiosity is the most superficial of all the affections; it changes its object perpetually, it has an appetite which is very sharp, but very easily satisfied; and it has always an appearance of giddiness, restlessness and anxiety. Curiosity, from its nature, is a very active principle; it quickly runs over the greatest part of its objects, and soon exhausts the variety which is commonly to be met with in nature; the same things make frequent returns, and they return with less and less of any agreeable effect. In short, the occurrences of life, by the time we come to know it a little, would be incapable of affecting the mind with any other sensations than those of loathing and weariness, if many things were not adapted to affect the mind by means of other powers besides novelty in them, and of other passions besides curiosity in ourselves. These powers and passions shall be considered in their place. But whatever these powers are, or upon what principle soever they affect the mind, it is absolutely necessary that they should not be exerted in those things which a daily and vulgar use have brought into a stale unaffecting familiarity. Some degree of novely must be one of the materials in every instrument which works upon the mind; and curiosity blends itself more or less with all our passions.

PAIN AND PLEASURE.

It seems then necessary towards moving the passions of people advanced in life to any considerable degree, that the objects designed for that purpose, besides their being in some measure new, should be capable of exciting pain or pleasure from other causes. Pain and pleasure are simply ideas, incapable of definition. People are not liable to be mistaken in their feelings, but they are very frequently wrong in the names they give them, and in their reasonings about them. Many are of opinion that pain arises necessarily from the removal of some pleasure; as they think pleasure does from the ceasing or diminution of some pain. For my part, I am rather inclined to imagine that pain and pleasure, in their most simple and natural manner of affecting, are each of a positive nature, and by no means necessarily dependent on each other for their existence. The human mind is often, and I think it is for the most part, in a state neither of pain nor pleasure, which I call a state of indifference. When I am carried from this state into a state of actual pleasure, it does not appear necessary that I should pass through the medium of any sort of pain. If in such a state of indifference, or ease or tranquillity, or call it what you please, you were to be suddenly entertained with a concert of music; or suppose some object of a fine shape, and bright, lively colors, to be presented before you; or imagine your smell is gratified with the fragrance of a rose; or if without any previous thirst you were to drink of some pleasant kind of wine, or to taste of some sweetmeat without being hungry; in all the several senses, of hearing, smelling, and tasting, you undoubtedly find a pleasure; yet if I inquire into the state of your mind previous to these gratifications, you will hardly tell me that they found you in any kind of pain; or, having satisfied these several senses with their several pleasures, will you say that any pain has succeeded though the pleasure is absolutely over? Suppose, on the other hand, a man in the same state of indifference, to receive a violent blow, or to drink of some bitter potion, or to have his ears wounded with some harsh and grating sound; here is no removal of pleasure; and yet here is felt in every sense which is affected, a pain very distinguishable. It may be said perhaps, that the pain in these cases had its rise from the removal of the pleasure which the man enjoyed before, though that pleasure was of so low a degree as to be perceived only by the removal. But this seems to me subtilty that is not discoverable in nature. For if, previous to the pain, I do not feel any actual pleasure, I have no reason to judge that any such thing exists; since pleasure is only pleasure as it is felt. The same may be said of pain, and with equal reason. I can never persuade myself that pleasure and pain are mere relations, which can only exist as they are contrasted; but I think I can discern clearly that there are positive pains and pleasures, which do not at all depend upon each other. Nothing is more certain to my own feelings that this. There is nothing which I can distinguish in my mind with more clearness than the three states, of indifferenee, of pleasure, and of pain. Every one of these I can perceive without

any sort of idea of its relation to anything else. Caius is afflicted with a fit of the colic; this man is actually in pain; stretch Caius upon the rack, he will feel a much greater pain; but does this pain of the rack arise from the removal of any pleasure? or is the fit of the colic a pleasure or a pain, just as we are pleased to consider it? * * * *

OF THE SUBLIME.

Whatever is fitted in any sort to excite the ideas of pain and danger, that is to say, whatever is in any sort terrible, or is conversant about terrible objects, or operates in a manner analogous to terror, is a source of the *sublime;* that is, it is productive of the strongest emotion which the mind is capable of feeling. I say the strongest emotion, because I am satisfied the ideas of pain are much more powerful than those which enter on the part of pleasure. Without all doubt, the torments which we may be made to suffer are much greater in their effects on the body and mind than any pleasures which the most learned voluptuary could suggest, or than the liveliest imagination, and the most sound and exquisitely sensible body, could enjoy. * * * But as pain is stronger in its operation than pleasure, so death is in general a much more affecting idea than pain; because there are very few pains, however exquisite, which are not preferred to death: nay, what generally makes pain itself, if I may say so, more painful, is, that it is considered as an emissary of this kind of terrors. When danger or pain presses too nearly, they are incapable of giving any delight, and are simply terrible; but at certain distances, and with certain modifications, they may be, and they are, delightful, as we every day experience. The cause of this I shall endeavor to investigate hereafter. * * * *

IMITATION.

The second passion belonging to society is imitation, or, if you will, a desire of imitating, and consequently a pleasure in it. This passion arises from much the same cause with sympathy. For as sympathy makes us take a concern in whatever men feel, so this affection prompts us to copy whatever they do; and consequently we have a pleasure in imitating, and in whatever belongs to imitation merely as it is such, without any intervention of the reasoning faculty, but solely from our natural constitution, which Providence has framed in such a manner as to find either pleasure or delight, according to the nature of the object, in whatever regards the purposes of our being. It is by imitation far more than by precept that we learn everything; and what we learn thus, we acquire not only more effectually, but more pleasantly. This forms our manners, our opinions, our lives. It is one of the strongest links of society; it is a species of mutual compliance, which all men yield to each other, without constraint to themselves, and which is extremely flattering to all. Herein it is that painting and many other agreeable arts have laid one of the principal foundations of their power. And since, by its influence on our manners and our passions, it is of great consequence, I shall here venture to lay down a rule, which may inform us with a good degree of certainty when we are to attribute the power of the arts to imitation, or to our pleasure in the skill of the imitator merely, and when to sympathy, or some other cause in conjunction with it. When the object represented in poetry or painting is such as we could have no desire of seeing in the reality, then I may be sure that its power in poetry or painting is owing to the power of imitation, and to no cause operating in the thing itself. So it is with most of the pieces which the painters call still-life. In these a cottage, a dunghill, the meanest and most ordinary utensils of the kitchen, are capable of giving us pleasure. But when the object of the painting or poem is such as we should run to see if real, let it affect us with what odd sort of sense it will, we may rely upon it that the power of the poem or picture is more owing to the nature of the thing itself than to the mere effect of imitation, or to a consideration of the skill of the imitator, however excellent. Aristotle has spoken so much and so solidly upon the force of imitation in his Poetics, that it makes any further discourse upon this subject the less necessary. * * * *

To be Continued.

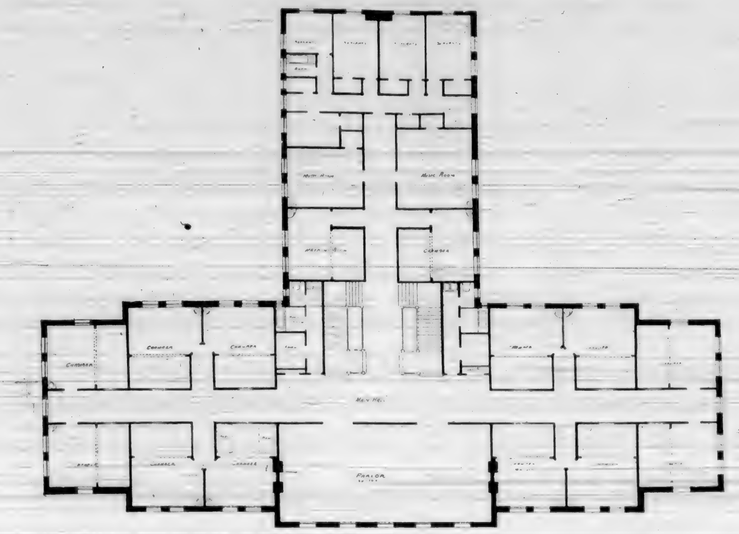
MYTHOLOGY.

AMAZONES or AMAZONIDES, a nation of famous women who lived near the river Thermodon in Cappadocia. All their life was employed in wars and manly exercises. They never had any commerce with the other sex; but, only for the sake of propagation, they visited the inhabitants of the neighbouring country for a few days, and the male children which they brought forth were given to the fathers. According to Justin, they were strangled as soon as born, and Diodorus says that they maimed them and distorted their limbs. The females were carefully educated with their mothers, in the labors of the field; their right breast was burnt off that they might hurl a javelin with more force, and make a better use of the bow; from that circumstance, therefore, their name is derived (*a non, uaza mamma*). They founded an extensive empire in Asia Minor, along the shores of the Euxine, and near the Thermodon. They were defeated in a battle near the Thermodon, by the Greeks; and some of them migrated beyond the Tanais, and extended their territories as far as the Caspian sea. Themyscyra was the most capital of their towns; and Smyrna, Magnesia, Thyatira, and Ephesus, according to some authors, were built by them. Diodorus, I. 3, mentions a nation of Amazons in Africa, more ancient than those of Asia. Some authors, among whom is Strabo, deny the existence of the Amazons, and of a republic supported and governed by women, who banished or extirpated all their males; but Justin and Diodorus particularly support it; and the latter says, that Penthesilea, one of their queens, came to the Trojan war on the side of Priam, and that she was killed by Achilles, and from that time the glory and character of the Amazons gradually decayed, and was totally forgotten. The Amazons of Africa florished long before the Trojan war, and many of their actions have been attributed to those of Asia. It is said, that after they had subdued almost all Asia, they invaded Attica, and were conquered by Theseus. Their most famous actions were their expedition against Priam, and afterwards, the assistance they gave him during the Trojan war; and their invasion of Attica, to punish Theseus, who had carried away Antiope, one of their queens. They were also conquered by Bellerophon and Hercules. Among their queens, Hippolyte, Antiope, Lampeto, Marpesia, etc., are famous. Curtius says, that Thalestris, one of their queens, came to Alexander, whilst he was pursuing his conquests in Asia, for the sake of raising children from a man of such military reputation; and that after she had remained thirteen days with him, she retired into her country. The Amazons were such expert archers, that, to denote the goodness of a bow or quiver, it was usual to call it Amazonian.

Near Marysville they have discovered a mine of hydraulic lime and near by a body of silicious earth, and a company has been formed to manufacture cement.

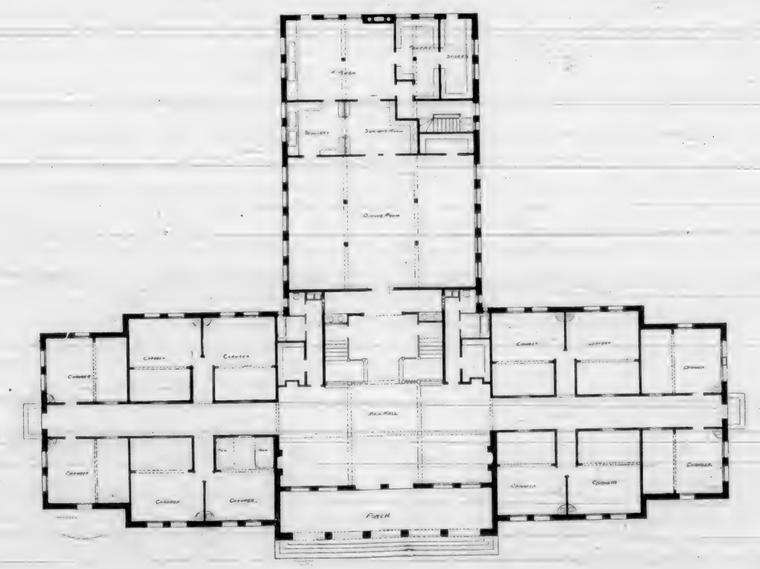
In territorial area the United States ranks third. Great Britain controls 8,557,000 square miles of territory, Russia, 8,452,940 miles, and the United States, counting Alaska, 3,580,242 miles.

The new labor law of New Jersey went into effect in July. It provides that fifty-five hours shall constitute a week's work, and it makes Saturday afternoon a holiday. On other days ten hours is a working day.

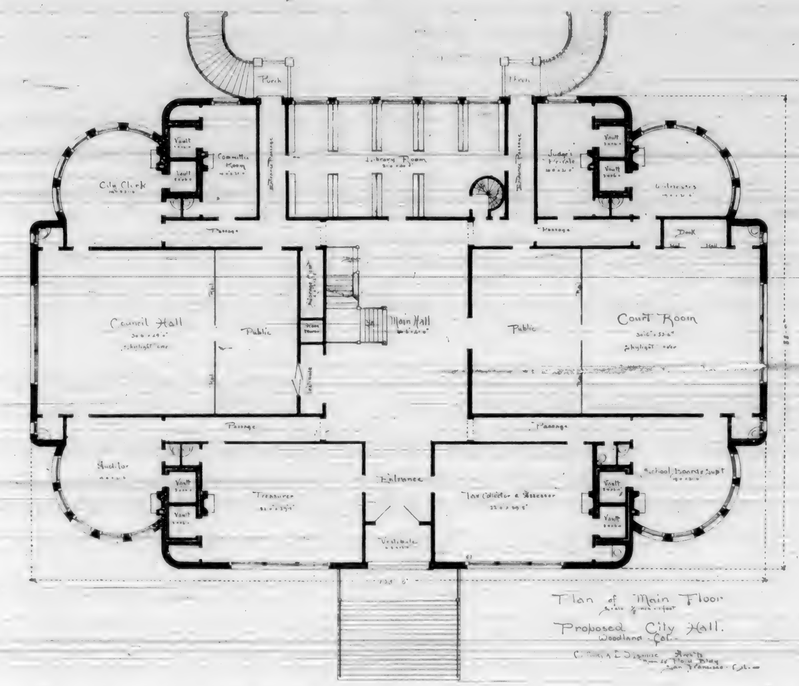


SECOND FLOOR PLAN.

THE plans herewith show the general arrangement of the main and second floors of Roble Hall, Girls' Dormitory, lately erected at the Stanford University, and will accommodate eighty pupils. This building is built of concrete and was erected and finished complete within ninety days from the order to prepare the plans. This is working with a rapidity unusual in buildings of such dimensions.



FIRST STORY PLAN.



PLAN OF CITY HALL, WOODLAND.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

THE sketch No. 2 of a building and landscape was worked out by Mr. Clarkson Swain. These sketches are three in number and so picturesquely delineated as to furnish artistic ideas to designers for rural buildings.

The remaining sketch will appear in a later number.

THE New City Hall at Woodland, Cal., is from designs by Messrs. Colley & Lemme, Architects, San Francisco.

THE design for the residence in course of erection for D. B. Jackson, Esq., is by Mr. Wm. H. Armitage, Architect, of this city.

ROBLE HALL, Stanford University.—The building "Roble Hall" (Oak Hall) or Girls Dormitory is built on the grounds of the Leland Stanford, Jr., University at Palo Alto, and is situated immediately north of the central quadrangle. The building is 175 feet long by a depth of 118 feet, is three stories high and will accomodate 80 pupils, besides the usual attendants.

The exterior walls are built of concrete, colored yellow to match the stone of the other buildings and built in a manner similar to the museum building of the University, the greatest piece of concrete building construction of modern years. The roof is covered with metalic shingles in imitation of the old tile work of early California buildings.

The floors throughout are finished with wax, the building being finished in a most thorough manner.

The dormitory was erected and ready for occupancy within 90 days from the time the order was given to prepare plans.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street

GEO. H. SANDERS, Pres. — OLIVER EVERETT, Vice-Pres.
H. T. BESTOR, Sec. — JOHN M. CURTIS, Tres.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.

JOHN RICHARDS, Pres. — L. WAGONER, Vice-Pres.
OTTO VON GELDERN, Sec. — GEO. F. SCHILD, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.

GEO. P. LOW, Pres. — C. O. POOLE, Vice-Pres.
W. I. CROSETT, Sec. — O. BROOKS, Treas.

SEMI-ANNUAL SUMMARY OF BUILDING OPERATIONS.

The first six months of this year has not been as prosperous as the indications at the beginning of the year promised. By a comparison with former years the contracts filed foot up less than for the last year.

FOR FIRST SIX MONTHS.—1892.

	No. of Buildings	No. of Contracts	Brick Building Value	No. of Buildings	No. of Contracts	Frame Building Value.	No. of Buildings	No. of Contracts	Alterations & Additions Value.	No. of Buildings	No. of Contracts	Total Value.
January ...	1	14	$ 101,872	22	33	$ 210,665	4	4	$ 7,872	27		$ 320,409
Febry ...	3	8	116,310	28	50	270,149	7	8	24,818	38	66	429,277
March ...	2	8	72,471	30	38	175,071	5	7	14,494	37	83	262,036
April.....	4	22	335,359	46	63	240,772	5	6	20,830	55	91	596,961
May.....	3	17	137,715	46	52	271,200	4	5	21,475	53	74	430,390
June.....	3	9	139,022	39	54	222,110	13	13	51,291	55	76	412,423
Total	16	78	$ 902,749	211	290	$1,398,967	38	43	$140,780	265	411	$2,442,496

To this amount the further sum of $500,000 should be added for work done where no contracts have been filed, which would increase the sum total to $2,942,496.

FOR FIRST SIX MONTHS.—1891.

	No. of Buildings	No. of Contracts	Brick Building Value	No. of Buildings	No. of Contracts	Frame Building Value.	No. of Buildings	No. of Contracts	Alterations & Additions Value.	No. of Buildings	No. of Contracts	Total Value.
January ...	3	10	$ 98,106	30	45	$ 174,204	6	7	$ 14,415	39	62	$ 286,725
Febry ...	5	21	305,554	33	32	130,664	5	6	23,751	43	59	459,969
March ...	7	16	221,001	48	58	333,075	13	14	53,586	68	88	607,662
April.....	3	8	119,192	50	80	372,799	12	14	44,390	65	102	536,381
May.....	3	14	228,989	49	79	288,736	15	17	100,165	67	110	617,947
June.....	5	23	211,032	88	123	835,499	16	16	42,558	109	162	888,889
Total	24	92	$1,183,874	298	417	$1,945,974	67	74	$278,865	391	583	$3,410,973

The business of the first six months for several years is shown by the following table.

1885—754 contracts	value,	$4,267,375
1886—670 "	"	2,486,633
1887—516 "	"	3,269,914
1888—437 "	"	2,719,820
1889—546 "	"	3,910,600
1890—556 "	"	3,793,858
1891—583 "	"	3,916,973
1892—411 "	"	2,942,496

In 1885 business was usually heavy. The first six months of this year shows an excess over 1886 and 88, and a decrease from 1889–90 and 91. The months of July and August will show about the same as the same months of last year. The prospect of a good fall trade appears to be good.

THE AMERICAN MONTHLY MICROSCOPIC JOURNAL for July has a chapter on Microscopical Illustrations; also many other papers of interest to workers in that line of science.

We have received the Annual Report of the SMITHSONIAN INSTITUTION and of the NATIONAL MUSEUM at Washington, D. C., for the years 1889 and 1890.

INDUSTRY, San Francisco, for August, has several chapters which present matters of interest to architects and engineers.

THE PHOTOGRAPHIC TIMES for July 15th and 22d, contains an article on "the diaphragm," giving much useful information to the operator. Where the usual circular opening is used, the writer proposes to set the diaphragm at an angle, viz., the top outward and the bottom inward from the usual vertical position, in which case it can be easily understood how the rays from the sky would be reduced while the ground on lower rays would be increased; thus the light reflected from a landscape would be equalized on the sensitive plate. The equalizing effect of a triangular opening in the diaphragm is also considered.

LIPPINCOTT'S for August contains a number of interesting articles. The department called "As It Seems" discusses the popular sentiment wasted on prisoners to the forgetfulness of the honest poor.

We give one of the short chapters:

REFORM BY REACTION.

"The root of the trouble is in our ethical ideas, which have come to be askew and top-heavy. 'The quality of mercy is not strained.'—but it often needs to be. As in divinity, 'a God all mercy were a God not just,' so in our morals and jurisprudence, the bottom is in danger of dropping out when compassion intrudes into the primary place of justice. Humanity and philanthropy are fine things, but like other fine things they are liable to be overdone. If our plea is reactionary, it may be urged that when we have gone too far forward, the only thing to do is to go back a little. It should be remembered that an honest man is better any day than a rogue, and he who loves his neighbor as himself is entitled to more consideration than he who is too handy with bludgeon, knife, or pistol.

THE COSMOPOLITAN for August contains an article on "Bridges and Bridge Builders," by Peter MacQueen. Also one on "A California Farm Village." The illustrations look very "home like" to a resident of this section of the country.

THE FORTNIGHTLY REVIEW deals with the "Servant Question," by MARY JEUNE. ALFRED BINET contributes an article on "Mental Imagery."

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Courts of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

Notice Requisite for Mechanic's Lien in Indiana.—Where in Indiana a contract was made and materials for it were furnished to the contractor part before the notice to the owner and part after such notice under Elliott's Supplement, section 1692, providing that a person furnishing materials for a contractor, to acquire a lien, must give notice to the owner at or before the time the materials are furnished, a lien would be acquired only for such part of the materials as were furnished after notice.

Hubbard v. Moore, Supreme Court of Indiana, 31 N. E. Rep. 534, 82C.

Payment for Extra Work.—In a contract for the erection of a house, a clause which provides that any addition or omission from the contract shall be added or deducted by a fair valuation, but shall in no wise affect the contract, prevents a claim for extra work from being brought under the terms of the contract; and full value for such extra work may be recovered, even though the requirements of the contract have not been complied with, unless the regular work has been done so negligently as to render the extra work valueless.

Garnsey v. Rhodes, Supreme Court of New York, 18 N. Y. Supp. 484, 96C.

Mechanic's Lien on Electric Light Plant.—An electric light company which has a franchise to occupy the streets of a city with its poles, wires and lamps, and is engaged in furnishing light to the people of the city, is not so distinctly public in its nature and operations as to exempt its property from the application of the mechenic's lien statute. 29 Pac. Rep. affirmed.

Badger Lumber Co. v. Marion Water Supply Electric Light and Power Co., Supreme Court of Kansas, 30 Pac. Rep. 117, 67C.

Requisites of Notice for Mechanic's Lien.—A lien notice should be sufficiently definite to fairly appraise the owner of what he is charged with, what kind of material, and what the same was furnished for.

Tacoma Lumber and Manufacturing Co. v. Kennedy, Supreme Court of Washington, 30 Pac. Rep. 79, 36C.

Lien Against Community Property of Husband and Wife.—Under the statute requiring a claim of lien to give the name of the owner or reputed owner of property sought to be charged, a claim which shows that claimant knew that an owner was married, but fails to give the name of such owner's wife, is fatally defective, as an action will not lie against a husband alone to enforce a mechanic's lien against his interests in community property, the wife being alive.

Sagmeister v. Foss, Supreme Court of Washington, 30 Pac. Rep. 80, 76C.

Substantial Compliance with Contract.—In an action to foreclose a mechanic's lien entered contract to do mason work, plaintiff may introduce as witnesses experts in the trade, to show that mason work does not include "plastering and white-washing". Where a contract for mason work to be done on a building by plaintiff provided that a certain payment should be made when the mason work was completed, and that plaintiff was delayed in his work on account of the delay of the work of another independent contractor, which had to be done first, and plaintiff used all diligence in going on with the work after it was possible for him to do so, and went prepared to finish the job, when he was ordered off by the owner, who had put other men on the work, it was a substantial compliance, and entitled plaintiff to his payment.

Highton v. Dessan, Common Pleas of New York, 19 N. Y. Supp., 395, 143C.

The value of the product of the factories and mills west of the Mississippi during the year 1891 is computed at $423,068,695, and the product of the states west of the Missouri alone is computed at $198,722,653.

One of the lumber mills of Seattle, Wash., recently prepared a number of timbers 100 feet long and 24 inches square, to be used for ship building at San Francisco.

POPULAR TALKS ON LAW.

By Wm. C. Sprague, Esq.

SUBSCRIPTIONS TO STOCK.

WHAT is the nature of the obligation one assumes, or does he assume any legal obligation, in signing his name to a subscription for stock in a corporation not yet formed? Is it a proposal, on his part, which he may withdraw at pleasure? Is it a one-sided agreement, or an agreement without consideration, or a conditional promise which may or may not be binding upon the signer according as he shall subsequently choose? It may be fairly stated that many names placed upon stock subscription papers are so placed without any definite comprehension of the nature of the transaction, and of its legal effect. This is apparent to anyone who has been the promoter of corporation enterprises and has had in charge the soliciting of subscriptions thereto. A few words in the direction suggested cannot fail to be of interest and profit to the public, inasmuch as corporate enterprises have become so numerous that there is scarcely an individual, howsoever humble his circumstances, but, at one time or another, has been solicited, or been tempted, to become a subscriber to the capital stock of a corporation. What then is a subscription to stock? It may be stated to be a promise, by the subscriber, to take and pay for the shares for which he subscribes, upon a consideration sufficient and valid to support it. The nature of this consideration we shall discuss later on. More fully, the promise is one to take and pay for the shares on the terms of the subscription paper, and of the act under which the company is organized. It is usual to state in the subscription paper what act it is intended to use in organizing, and if that act makes the stockholders individually liable for the debts, they are thus liable, even although they have not done anything beyond the signing of the subscription paper. In other words, a subscription to the stock means more than an assent to the mere proposal to form a corporation for certain purposes. It means the same as if all the provisions of the statute under which it is proposed to organize were a part of the agreement signed. The agreement of the subscriber is to take the number of shares set opposite his name, and to pay for them according to the provisions of the act. The subscription may be made on condition, as for instance, that the amount subscribed shall reach a certain sum, and it has been held that, in the case of the condition mentioned, it must be intended to mean fair subscriptions, such as may probably be collected. As to the form of subscription, all that is required is that it shall indicate the intention of the subscribers to become stockholders, and the number of shares respectively taken by them. The several subscribers may sign separate instruments, they being copies of each other, and they will be regarded as one and the same instrument, and where a statute requires that subscription books shall be opened, it has been held that one or several subscription papers constitute a "book" within the meaning of the statute. The signer of a subscription paper before the organization of the corporation is complete, cannot withdraw his subscription without the consent of the other subscribers, and, though he has erased his name, the corporation can collect his subscription. This has not been declared to be the law without exceptions, but it has been held universally that where the incorporating of the company was completed, before the subscriber attempted to withdraw his subscription, he had lost the right to do so. When one has signed articles of association, he has entered into a contract which is not open to revocation. The other subscribers have an interest in the execution and performance by each subscriber of his agreement, and after the incorporation has begun a legal existence it has acquired a vested interest in each subscriber's agreement. This subject will be continued in a further paper.

Thirty-seven car loads of shingles were recently shipped by special trains from Seattle to eastern cities.

BUSINESS MOSAICS.

The Roebling Standard Wire Lathing is made for common plastering mortar having hair in its composition, and, also, a special lath for the various plastering compounds where no hair is used. The wire cloth for common mortar is made with square meshes of about three-eighths of an inch, and the wire cloth for special use is made with elongated meshes about three-sixteenths by three-eighths of an inch. This manner of forming the meshes allows the unhaired mortar to pass through and key without falling off before setting. Wire lathing has many advantages, and one that will commend itself is that the wires of the lathing are embedded and thoroughly covered on all sides with the mortar, thereby forming a complete fire-proof screen. The cloth is made with stiffening bars at intervals so that it may be applied to studding or beams as usually placed. One of the later improvements for this form of lathing is a special fastening to iron beams and is easily applied.

They also furnish a special rod or support for longer spans, such as are between iron beams, etc.

The increased cost of using wire lathing is but little more than wooden lathing, and it can be applied by any ordinary mechanic. If such lathing should come into more general use the danger from fires would be reduced.

It is unfortunate for some of the manufacturers of articles and appliances for use in buildings to drop out of the market just at the time when architects are preparing plans for buildings to be erected in the fall.

The Vulcan Iron Works, 135–145 Fremont street, are continually extending their line of specialties for various uses. Their stable fittings have become a standard article. The hand hoists made by them are unexcelled. They have put up some of the largest rope tramways on the Pacific Coast. Persons looking for refrigerators and ice machines for cool storage and packing houses should call on them.

When the festive spider weaves visions of delight over the cash box, it signifies hope without advertising.

Parquet Floors or Wood Carpet make a splendid effect when laid with close fitting joints and the various colored woods worked to harmonize. The smooth, cleanly-finished surface of a parquet floor does not hold dirt or dust, and disease germs find no place for propagation. For this climate this form of hard wood floors is especially adapted, being cleanly, decorative, elegant and economical. For first-class work in this line, Mr. J. M. Reynolds, 659 Market street, San Francisco, has made his establishment the leading one in this city, and his decorations can be seen in the best residences and offices.

Good planning is the essence of economy.

A Porcelain-lined Roll Rim Bath Tub and Foot Bath, are shown on page v., which for practical convenience and artistic design are unrivaled. It is at once apparent that they are from the J. L. Mott Iron Works.

The farmer sows the seed and goes to sleep with the consciousness that nature's forces are working for the increase of his riches. The wise advertiser also knows that while he sleeps *his* crop is maturing and he prepares himself to reap the harvest at the proper season.

The young man, the country architect, and the builder who desires to improve himself in the art and science of building, should carefully read and study the best works on that subject to be had. The California Architect and Building News will furnish him with valuable reading and hints for study, and its advertising pages will give him good ideas in regard to the improvements of the day in that line.

Improvements and care that reduce the cost of production or improve the quality, are equivalent to an increase of the price of the article.

The Excelsior Redwood Co., corner of Fourth and Channel streets of this city, has become one of the most useful manufacturing concerns on the coast. At this factory can be had, ready made, almost everything required for either interior or exterior finish, such as corner and base blocks, balusters, fancy turned columns and posts, etc. The inside partition material three-fourths to one and one-fourth inches thick, planed and moulded in different forms on both sides ready to put up has become a favorite article for convenient use. A patent corrugated roofing is another useful article which has been added to their stock and finds a ready sale. This roofing is worked both sides, is furnished in lengths from three to twenty feet and is especially adapted to hoods and projecting caps over doors and windows, roofs of verandas and porches, summer houses, and all kinds of light roof work. All the lumber is kiln dried and of first quality. See advertisement on page xvii.

The doctor who prescribes gratuitously gives a worthless prescription.

The Fitzgerald Prepared Wall Plaster is making a heavy inroad on the old method of plastering. The Pacific Patent Plaster Company has very extensive works at Rodeo where it is prepared to manufacture in quantities to suit. The advantages to be had by the use of this plaster are many, and persons in search of information should call at the office of the company, 216 Bush street, San Francisco.

The Olympic Club Building, also the Heilbron Building is being plastered with this plaster.

Royal Metalic Paint is a California product and of a dark red color, but of a lighter tint than other metalic paint, consequently, does not give such a somber look. It is made only from the best materials and combines extreme fineness, density, uniformity, reliability and the highest possible degree of covering quality. It is one of the very best paints for use on roofs, farm and out-buildings. Its elasticity is retained for a long time and thus prevents the wood from cracking, and the paint from chipping, scaling or blistering. It furnishes a really good article at a moderate cost. The covering quality is so good that a good effect can be had with one coat only.

Edward Denny & Co., of 418 Montgomery street, is an old established house for the supply of draughtsmen's materials. This firm makes *blue* or *black* prints from drawings and architects in the outlying districts will find this an economical and convenient means for obtaining copies of their drawings. To many the process is inexpensive because they first prepare a complete line drawing on heavy paper, then trace on translucent linen or paper. A large proportion of drawings can be made on paper 20x33 inches. When this size can be used a superior paper for the purpose can be obtained from them. This paper is very strong and is readily worked upon with pencil or ink, and is sufficiently translucent to give clear prints. By making the drawings specially for the purpose much better prints may be had. Avoid color, as black, red and yellow all have the same effect on the print, and in our own practice we have used the single hack line for wood, or stud and plaster walls, and the double or cross hack lines for brick work; these lines will leave clear marks on the print which can be colored if desired. The original drawing if made in water-proof ink may be colored after the prints have been made. In all cases the ink lines should be very dense so that no light works through them to blur the lines of the print.

Elevators for office and commerical buildings have become so general that old premises where this convenience does not exist must have the rents set low or stand tenantless. Inventive genius is actively seeking new combinations whereby the greatest amount of work may be had at the lowest cost. The latest lift for public favor is the Kieckhefer Elevator manufactured and put up by Trimborn Bros., room 20, Flood Bldg., this city.

It combines speed, safety and the utmost economy, and can be arranged for any class of work from the lightest to the heaviest freight hoist and for the most elegant passenger car. This elevator is taking the place of the older ones and is being put into some of the largest buildings in course of erection in this city. Its advantages are at once apparant upon examination, and will, without doubt, increase in favor as it becomes more generally known.

TENDERS TO BE RECEIVED.

Treasury Department, Office Supervising Architect, Washington, D. C., August 12, 1892. Sealed proposals will be received at this office until 2 o'clock P. M. on the 6th day of September, 1892, and opened immediately thereafter for furnishing all the low pressure, return-circulation, steam heating and ventilating apparatus, for the U. S. Court House, Post Office and Custom House building at Vicksburg, Miss., in accordance with the drawings and specification, copies of which may be had on application at this office, or the office of the Superintendent at Vicksburg, Miss.

Each bid must be accompanied by a certified check for a sum not less than 2 per cent. of the amount of the proposal.

The right is reserved to reject any and all bids and to waive any defect or informality in any bid, if it be deemed in the interest of the Government to do so. All proposals received after the time stated will be returned to the bidders.

Proposals must be enclosed in envelopes, sealed and marked, "Proposal for the Low Pressure, Return-Circulation, Steam Heating and Ventilating Apparatus for the U. S. Court House, Post Office and Custom House building at Vicksburg, Miss." and addressed to,

W. J. EDBROOKE,
Supervising Architect.

CITY BUILDING NEWS.

Baker and Clay. Frame building; owner, Geo. W. Hendy; architects, Stone & Munson; contractors, Knox & Cook; cost, $4,499; signed, June 30; filed, July 1; payments, $1,234.75, enclosed; $1,234.75 plastered; $1,234.75, completed; $1,234.75, 35 days.

Bartlett near 22d. School building; owner, Board of Education; architect, C. I. Havens; contractors, F. Doyle & Son; cost, $24,440; signed, July 25; filed, July 28; payments, $4,500, brick foundation built, frame up and enclosed; $4,500, rough water and gas pipes in and brown mortar on; $4,500, plastered and outside primed; $4,749, completed; $6,200, 35 days.

Cramer; contractors, Marcuse & Remmel; cost, $3,400; signed, June 30; filed, July 2; payments, $850, foundation laid, frame and chimneys up, and roof sheathing on; $850, brown mortar, roof and exterior finish on; $850 completed; $850, 35 days.

Castro St., Haywards. To build; owner, Leopold Palmtag; architect, Thos. Moran; contractor, A. L. Campbell; cost, $9,377; signed, July 16; filed, July 18; payments, $1,500, walls ready to receive 2d floor joists; $1,500, 2d floor joists in place and walls constructed; $1,000, building enclosed and covered with tin; $1,000, brown mortar on; $1,000, plastered; $1,032, completed; $2,345, 35 days.

Dormitory, St. Mary's Cemetery. Underground vault and concrete work; owner, Mary Canning; architect, Chas. J. Devlin; contractor, Geo. Goodman; cost, $2,385; signed, June 24; filed, June 27; payments, 75 per cent. as work progresses; 25 per cent. 35 days.

Eighth near Center, Oakland. Two-story frame; owner, J. C. Westphal; architect, Chas. Mau; contractor, H. E. Jones; cost, $4,500; signed, July 14; filed, July 14; payments, $1,137.50, ½ materials furnished and work done; $1,137.50, ⅔ materials furnished and work done; $1,137.50, completed; $1,137.50, 35 days.

Fourteenth near Washington, Oakland. To build; owner, Georg Uhl; architect, W. J. Mathews; contractor, Judson Manufacturing Co.; cost, $4,180, signed, June 30; filed, June 30; payments, $1,564, ¼ work completed; $1,567; completed; $1,046, 35 days.

Fruitvale Ave. Plumbing, gas-fitting, etc.; owner, F. Tillman, Jr.; architect, H. Geilfuss; contractor, Chas. F. Fischer; cost, $1,350; signed, July 12; filed, July 22; payments, 1st and 15th day of each month 75 per cent. as work progresses, 25 per cent. 35 days.

Fruitvale Ave., Berkeley. To build; owner, Fred Tillman, Jr.; architect, H. Geilfuss; contractors, Schutt & Kreckler; cost, $8,500; signed, July 12; filed, July 14; payments, $1,275, frame up; $1,275, enclosed, floors laid and partitions set; $1,275, brown mortar on and outside work completed; $1,275, inside standing finish on; $1,275, completed; $1,275, 35 days.

Fruitvale Ave., Berkeley. To build; owner, Fred Tillman, Jr.; architect, H. Geilfuss; contractor, August Fick; cost, $1,090; signed, July 12; filed, July 14; payments, 1st and 15th day of each month 75 per cent. as work progresses; 25 per cent. 36 days.

Gashill Tract, Oakland. One-story & basement; owner, J. C. Bly; architect, John Conant; contractor, Joseph T. Francis; cost, $1,050; signed, June 22; filed, June 27; payments, $950, frame up and rustic on; $950, completed; remaining payment 35 days.

Haight Tract, Alameda. Two-story frame; owner, M. Ryder; contractor, A. R. Denike; cost, $1,450; signed, June 30; filed, July 2; payments, $600, frame up; $600, brown mortar on; $600, completed; $650, 35 days.

Hobart and Grove, Oakland. Plumbing; owner, Rev. T. McSweeney; architect; C. J. D. Devlin; contractor, E. P. McGowan; signed, July 12; filed, July 16, payments, 75 per cent. as work progresses; 25 per cent. 35 days.

Hobart and Grove, Oakland. Lathing and plastering; owner, Rev. T. McSweeney; architect, Chas. J. Devlin; contractors, G. P. & T. J. Smyth; cost, $7,500; signed, July 21; filed, July 22; payments, $500, walls above main ceiling lathed; $1,500, building scratched and coated; $1,500, walls above main ceiling finished; $750, remaining walls finished; $1,350, completed; $1,900, 35 days.

Hunting Tract. Two-story frame; owner, Chas. Harrison; contractor, E. P. McGowan; cost, $1,450; signed, July 13; filed, July 16; payments; $575, frame up and rustic on; $575, enclosed, brown mortar on and floated; $575, completed; $375, 35 days.

Jones Ave., San Leandro Road. Four buildings; owner, H. Jones; contractors, Marcuse & Remmel; cost, $6,990; signed, June 29; filed, June 29; payments, $1,747.50, frame up and roof on; $1,747.50, brown mortar on; $1,747.50, completed; $1,747.50, 35 days.

Kellesburger Map of Oakland, Block No. 52. Two-story. flat; owner, Mrs. Eliza Fitzell; architect, Elmer C. Childs; contractor, Geo. Gale; cost, $2,880; signed, July 6; filed, July 8; payments, $720, frame up and roof on; $720, enclosed and brown mortar on; $720, completed; $720, 35 days.

Lake Merritt Park, Oakland. To build; owners, Holway & Lane; architect, John Conant; contractor, J. A. Eastman; cost, $3,150; signed, June 21; filed, July 6; payments, $787.50, frame up and roof sheathed; $787.50, brown mortar on; $787.50, completed; $787.50, 35 days.

Lake Merritt Park, Oakland. Two-story frame; owners, Holway & Lane; architect, John Conant; concractor; J. A. Eastman; cost, $3,232; signed, June 21; filed, July 6; payments, $800, frame up and sheathed; $800, brown mortar on; $800, completed; $800, 35 days.

Lake Merritt Park, Oakland. Carpenter, brickwork, etc.; owner, O. A. Lane; architect, John Conant; contractor, J. A. Eastman; cost, $3,500; signed, June 21; filed, July 6; payments, $850, frame up and roof sheathed; $850, brown mortar on; $850, completed; $850, 35 days.

Laurel near Clinton Ave. Two-story dwelling; owner, L. S. Bailey; contractor, C. A. Brown; cost, $2,300; signed, July 8; filed, July 14; payment, $575, frame up and enclosed; $575, brown mortar on; $575, completed; $575, 35 days.

Levy Tract, Brooklyn. Two-story frame; owner, J. W. Phillips; contractor, Chas. Murcell; cost, $5,673; signed, July 7; filed, July 8; payments, $1,418.25; foundation in and roof on; $1,418.25 outside completed and brown mortar on, $1,418.25, completed; $1,418.25, 36 days.

Linda Vista Terrace, Oakland. Two-story building; owner, David R. Rae; contractors, Weeks & Son; cost, $3,756; signed, July 7; filed, July 8; payments, $939, rough frame and chimney built; $939, brown mortar on; $939, completed; $939, 35 days.

North Temescal. Church; owner, Presbyterian Church; architect, J. B. Matheson; contractors, Pierce & Ruch; cost, $6,503; signed, July 7; filed, July 25; payments, $1,875, foundations in and rough frame up; $500, roof shingled and stained; $500, doors and window frames in and outside of house shingled; $500, plastered; $1,000, inside work completed, $500, completed; $1,625, 35 days.

Park near Shattuck Ave. To build: owner, Robert Raphael; contractor, F. E. Armstrong; cost, $1,350; signed, July 6; filed, July 18; payments, $335, enclosed; $335, brown mortar on; $335, completed; $345, 35 days.

Peralta and 17th, Oakland. Two-story addition; owner, Wm. Walsh; architect, Chas. Mau; contractors, Herbst & McLeod; cost, $2,400; signed, July 16; filed, July 16; payments, $600, ¼ materials furnished, and work done; $600, materials furnished and work done; $600, completed; $600, 35 days.

San Leandro Road near Jones. Hotel building; owner, A. Jones; contractors, Marcuse & Remmel; cost. $7,650; signed, July 19; filed, July 19; payments, $1,912.50, frame up; $1,912.50, brown mortar on; $1,912.50, completed; $1,912.50, 35 days.

San Pablo Ave., Golden Gate. School building; owner, Bay School District; architects, Smith & Farr; contractors, McDonald & Eggleston; cost, $12,253; signed, July 25; filed, July 26; payments, $3,063.26, frame up; $3,063.25, floors laid roof and brown mortar on; $3,063.25, completed; $3,063.25, 35 days.

Telegraph Ave., Oakland. Two cottages; owner, Mrs. S. J. Hubbard; architect, R. Gray Frise; contractors, Bryan & Irwin; cost, $3,584; signed, July 25; filed, July 25; payments, $896, enclosed; $896, roof on, floors laid, rough plumbing done and brown mortar on; $896, completed; $896, 35 days.

Tenth near Jackson, Oakland. Two-story frame; owner, James L. McCarthy; architect, Howard Burns; contractor, C. J. Brophy; cost, $3,220; signed, July 7; filed, July 9; payments, $805, frame up and brickwork completed; $805, enclosed and brown mortar on; $805, completed; $805, 35 days.

Twenty-first near 10th Ave., Oakland. Two-story dwelling; owner, W. C. Harrington; architect, A. W. Pattiani; contractor, C. A. Parker; cost, $3,865; signed, July 4; filed, July 5; payments, $724, frame up; $724, enclosed and brown mortar on; $724, plastered, outside except steps ready for painting; $724, completed; $909, 35 days.

Twenty-second and 23rd Ave., Oakland. One story and basement dwelling; owner, L. W. Palmer; architect, A. Winberg; cost, $1,770; signed, July 12; filed, July 13; payments, ⅓ frame erected; ⅓ enclosed, first coat of plaster on; ⅓ second coat of plaster on, all doors and windows in; last payment 10 days after completion.

Twenty-third Ave. near 15th St. Two-story frame; owner, Anna Meyer; architect, B. McManus; contractor, Addison Buck; cost, $2,762; signed, July 14; filed, July 19; payments, $600 frame up and rustic on; $600, completed; $962, 35 days.

Twenty-third Ave. and 14th, Oakland. Two-story frame; owners, Chaffer & Henderson; architects, J. C. Mathews & Son; contractors, Caldwell & Nickersen; cost, $2,905; signed, July 26; filed, July 28; payments, $300, frame up; $700, enclosed; $400, brown mortar on and outside primed; $752.50, completed, $752.50, 35 days.

Twenty-fourth and Valez. Two-story frame; owner, Mrs. Weber; contractors, Leiter & Prugh; cost, $2,405; signed, July 28; filed, July 28; payments, $300, house up and roof on; $300 enclosed and plastered; $300, completed; $505, 35 days.

The California Architect and Building News.

Copyrighted 1891, by the California Architectural Publishing Company.

OFFICE, 408 CALIFORNIA STREET, SAN FRANCISCO, CAL., U. S. A.

VOLUME XIII. SEPTEMBER 20th, 1892. NUMBER 9.

A MONTHLY JOURNAL DEVOTED TO THE ARCHITECTURAL INTERESTS OF THE PACIFIC COAST.

Published on or about the 20th of each month by The California Architectural Publishing Company. The Stockholders being Architects and others interested in the profession.

SUBSCRIPTION TO THE JOURNAL, - $3.00 PER YEAR IN ADVANCE.

ESTABLISHED 1879. INCORPORATED 1889.

NOW IN THE THIRTEENTH YEAR.

W. J. CUTHBERTSON, President. OLIVER EVERETT, Secretary.

ADVERTISING RATES:

Space	1 Month.	3 Months.	6 Months.	12 Months.
1 Inch	$ 1 50	$ 4 00	$ 7 50	$ 15 00
3 Inch	4 00	10 00	18 00	35 00

THE old saying that "Coming events cast their shadows before," has been brought before us during the last few weeks. The daily papers have given detailed accounts of the Cholera in other countries, and already the shadow of the plague has become well defined in the states bordering on the Atlantic, and may possibly reach this Coast.

This Journal has always taken the position that usefulness, art, strength and health are the four principal factors in good architecture, therefore we offer no excuse for the extra space allotted to sanitary questions.

A large proportion of the buildings in this city and in some of the towns and villages, also many suburban and farm-houses, have the main water supply run into tanks set at a sufficient height to supply the water for use. After a time the water in such tanks becomes covered with a green scum, while decayed organic matter settles at the bottom ready to enter the house supply pipes and be drawn off for household purposes. It needs no argument to show the beneficial result of cleansing these tanks at least once a week. There is a convenience for the cleansing of boilers in the kitchens of many of our residences,—viz., a sediment outlet at the lower part of the pipes under the boilers. The sediment should be drawn off every morning through the faucet. Sometimes this faucet is provided with a waste pipe to a hopper outside the house.

ONE source of danger is to be found in the cities and towns on this Coast where the roofs are used by the Chinese for drying clothes and other purposes only known to themselves and to persons having business which gives them knowledge of this state of affairs. The main roofs are nearly flat and in most cases covered with tin or asphaltum; at a short distance above this there is a floor of boards placed upon light frame work which serves as a cover for the roof. The space between the roof and boards is, in many cases, reeking with moist filth, which under proper authority could be cleaned up and taken away.

THE bake shops may be looked after; the bread, cake and pie pans are in some cases greased with old and rancid fats which permeate the product and may become generative of pestilence.

WE have ordinances sufficient, provided the surveilance was more efficient, to abate one of the worst evils extant. The streets are carefully swept and cleaned up during the night time; in the morning the stores or shops are opened and swept out upon the sidewalks and into the streets, so that by noon the streets contain large deposits of dirt and dust to be raised and wafted about by the winds.

WHILE the question of the transfer of dirt into the street, is considered, it may be well to mention that in most, if not all, the rooming houses fronting on the streets, the inmates of the front rooms use the streets for the deposite of debris from their rooms, and about midnight the pedestrian will every little while hear and see a package from some window thrown into the street. In some localities if the person occupying the first story objects to such methods of scavenging for the upper stories, the landlord straightway raises the rent, as the rottenness of the rooms above pays more than the business places below.

WHERE should be an inspection of fruit and vegetables set out for sale in our markets. Decayed and decaying edibles are a prolific source of propagation of infectious diseases. At many of the street corners may be seen peddlers dealing out partially decayed fruit.

WHE excretions of the dog or cat are considered poisonous, and the animal will try to cover it with earth when the surroundings will admit of it. The dog of the built up districts will not soil its own home, and we have never seen any good reason why it should be allowed to soil the neighbors' doorways or premises, and we fail to understand why it should be permitted to soil the fruit and vegetables for sale in the shops and on the sidewalks of our green-grocers. This is an evil that should be the subject for a crusade by the people and officials. There should be an ordinance passed that no fruit or vegetables should be deposited less than two feet from the floor or sidewalk where subject to this danger.

ON the ninth day of September, 1850, California was admitted into the Union as a state.

The anniversary of this event, or as it is called, "Admission Day" is celebrated each year in a way that only true western people know how to celebrate. This occasion is recognized as a legal holiday and the organization of the "Native Sons of the Golden West" supervises the ceremonies. The coming generation is taught to realize the importance of its glorious state which sprang from a wilderness into a state without ever having a territorial government.

A just pride is taken by the Native Sons and their auxiliary, "The Native Daughters," in upholding and advancing the culture and refinement of "The Golden State" and they deem this the proper day for giving vent to their joyous feelings.

On Admission Day it is customary for the "parlors" of the N. S. G. W. in certain districts to join together and hold their celebrations at some place decided upon by the committee. This year, Santa Rosa, a beautiful, prosperous little city, famous for the exquisite roses raised within its limits, was the favored spot for a number of parlors from this great metropolis.

Santa Rosa is about fifty miles north of San Francisco, and for three days, regularand special trains were run to accommodate the vast throng of people who were either going to take part in the festivities or enjoy the hospitality of the residents of the "City of Roses."

The Veteran Firemen of San Francisco received a cordial invitation to participate in the ceremonies of Admission Day, and on Sept. 9th, the sun, while yet rising from behind the hills, beheld numerous veterans attired in their fiery red shirts, surveying and enjoying the beauties of the surrounding country before going to parade. The Native Sons appeared in their fine costumes and the Native Daughters rivaled the beauty of the hills in Spring-time.

In the long parade that took place that day, the presence of the Veteran Firemen with their old "Masheen," presented a strong contrast with the sturdy Santa Rosa Brigade and its modern apparatus, and to the moralizer, suggested the connection of the past with the present.

All the parlors kept "open house," and the people of Santa Rosa entertained their guests royally, and all manner of good things were provided in abundance for the gratification of the eye, the ear and the taste.

The excellent behavior of the vast mass of people who gathered together to commemorate the admission of California into the Union, speaks well for the future of our State.

After spending a day or two very pleasantly and profitably, the Native Sons and Daughters returned to their business and home duties.

DURING the short time the Veteran Firemen remained in Santa Rosa, as guests of the N. S. G. W. and the resident Firemen, we noticed the excellent steam fire-engine and hose cart, drawn by horses, and it surprised us to see such a brisk and growing city with a hook and ladder truck drawn by the members of the Company.

When buildings in the country towns were erected more than one story in height, the hook and ladder company became of importance, and as the height of buildings increase, this division of the fire brigade becomes more pronounced.

Where a fire occurs in a two or three story building, more effective work can be done when the hose is carried to the upper stories and in such cases the ladder is a useful adjunct in saving property.

The water supply for this thriving city comes from springs among the adjacent hills, and its purity appears to advantage in the healthful looks of the residents.

COMMERCIALISM IN ARCHITECTURE.

MUCH has been lately written about a National Style of Architecture; the world has advanced and intercommunication is so facilitated that Nationalism in Architecture is no more; and the Architecture of the World must now be cosmopolitan, thus following the trend of the mind of tha organism, Society, in the broad sense of the word.

Much can be learned in this regard by studying the predominating trait of Society in general at any epoch in determining the Architecture most suitable to it, or the Architecture which manifests or shows such predominating trait best, or in other words, Art is generally a reflexion of the stronger passions of the people most in vogue.

Now "Commercialism," or more correctly speaking "Mammonism," is the preponderating feature of the latter part of this Century. I use the Eastern word "Mammonism" as I believe we have no word for such a despicable religion in the Anglo Saxon tongue, which speaks well for

that race in its infancy, the nearest compound is "The Worship of Pelf."

We ought to find, therefore, Art affected seriously by this "Mammonism" both for good and bad—if the foregoing hypothesis is true—and so we find it in many respects.

For example: "Mammonism" says that so much rent has to be gotten out of a certain piece of ground, so up goes a fourteen to twenty story building regardless of all other considerations. The same spirit says we must impress our suppliers with the stability of our concerns; so up springs magnificent Banking buildings, Insurance buildings, Boards of Trade and Exchanges, all devoted to speculating on Production.

In the same way the private individual must not allow another to eclipse him in the ornateness and costliness of his house or he will lose the respect and trust of the community, to which may be credited the striving after novelties and strange effects, a species of Advertising which is another of the predominating features of the times—the same spirit giving rise to the vulgar, nauseating and generally very incorrect descriptions of Dwelling Houses and other buildings which teem in our newspapers and journals; the Reporters dwelling always with unctuousness upon the vast amount of money expended, as if that fact was really the only concomitant worthy of much consideration in the Artistic worth of a thing.

This spirit in like manner we find permeating the poorer class and we find it putting up all manner of extraordinary looking buildings, generally wishing to indicate by their appearance that they are really more costly than they are; a sin carried to excess by the speculating builders.

So we may go on through all the phases of Architecture and perceive that throughout them all this prevailing spirit guides their direction.

The effects upon the Architects themselves of this compulsion of search after novelties is on one side no doubt deteriorating and on another stimulating—but mostly the first upon the younger members of the profession, who are specially tempted by it to leave the sober paths of Truth, Fitness and Strength for the excitement of the search after the Picturesque and Meretricious, thus leading them into all manner of extravagances, pettinesses and prettynesses, and getting notwithstanding sometimes beautiful results, although wanting in the air of Grandeur and Stability necessary for good Architecture.

This "worship of Pelf" may also be the reason of the adoption of the Colonial styles for our homes, as representing the Architecture of the time when America was a dependency of Royalty and had not become yet a Republic, the first representing a higher circle in its hierarchy in the opinion of plutocracy.

Taking the first mentioned sign of this worship—the mania for utilizing every inch of ground as high to the sun as possible—we may see where the legitimate carrying out of its ideas will land us in the end by the discussion in one of our Architectural journals as to the feasibility of doing without natural light and air altogether in buildings in our large cities, allowing the whole area to be built upon by twenty story buildings.

The recommendation was that light should be supplied by electricity and that air and ventilation should be obtained by pumping up air from somewhere in the street space outside the building and making it artificially warm or cold as required and pumping it out again when vitiated.

It is food for surmise what kind of beings or existents would be developed after a generation passing most of their lives in such a condition—possible worse than the results of our underground system of labor and gaslit offices and backs of dark stores and inside rooms.

Whether from the cause indicated in the paper or from some other, we find in the prevailing style of the Architecture of our present buildings what I am bold enough to consider a bad motif.

We find all the meaningless mouldings and ornaments of the Colonial style adopted, it itself being an ignorant imitation of the European Architecture when it was at about as low an ebb as it ever was, viz., at the Georgian period in England. This leads to the small, petty, uncouth and bebeaded mouldings which possibly might pass muster when applied to a ladie's cabinet or dressing table, but are simply ridiculous and irritating when used for working in hard marble at the base of a huge building.

The same pettiness is exhibited in the playing with bricks and cast ornaments and arranging them in different positions in and out and so forth, which is appropriate for childhood's days and was in fact done in the infancy of the Romanesque style, but never upon eleven story buildings.

Thus we find that even what there was of good in debased styles imitated nowadays has very often been eliminated and the worst features perpetuated.

Thus e. g.: The useful and appropriate entablature of the Renaissance dividing the several parts of a building has been done away with in their modern editions, and the basement runs into the upper part of the building with no other mark of division than change of material. So all the way up the facade; so that looking up the side of an Ironclad from the bottom of a dry-dock is almost as inviting a view as looking up some of our latter day buildings.

These criticisms are simply made and examples taken from places that we pass every day, for the purpose of better elucidating the matter of this paper, and not as any reflexion upon the Architects themselves, who are doing their best trying to solve a difficult problem, "The Wedding of Art with Mammon," and are all aiding by their mistakes as well as their successes to bring about a better state of affairs Architecturally.

To sum up the matter, the whole world being now, by our improved means of intercommunication both of travel and speech, brought together in no such way as ever before in history, and the whole being dominated by communication, Nationalism is being slowly and surely done away with, and universal commercialism and Architecture to suit, is taking its place, a consummation which is not to be regretted.—*W. J. C.*

KILN DRIED WOOD.

KILN drying hard woods for carriage purposes has its advocates and its opponents. On the one hand, it is claimed that the wood is rendered more rigid and firmer by kiln drying than when air dried, while on the other it is claimed that kiln drying destroys the life of the wood, and makes it brash and weak. Much of this difference of opinion arises from the conditions to which the wood experimented upon was subjected. Timber cut in the summer, when the flow of sap is abundant and when the fibres are distended, will be damaged badly by kiln drying, especially if the heat is extreme at first. Less damage will be done by running at a low heat for ten or twelve hours, gradually increasing thereafter until the extreme is reached. The damage of thus attempting to dry green timber at a high heat, is due to the watery portions of the sap generating steam, in-

stead of being absorbed by the dry air. The steam thus generated destroys the glutinous portions of the sap, and removes those properties which constitute the life of the wood.

Timber cut in the rest period, when the flow of sap is at its least, and the wood in its most compact state, is less liable to injury from being put into the kiln immediately on being cut, than that cut when the flow is full, but even it may be injured. Experience has proved that the best results are attained by air drying, three to six months, according to the size of the timber, before putting it into the kiln, and then raising the heat gradually for twenty-four hours. The arrangement of the kilns to insure an escape for excess of moisture, and to control and regulate the heat, must be of the best character.

Experts who have given special attention to the matter of kiln drying, while claiming much for kiln dried timber that has been skillfully manipulated, admit that the best of timber can be rendered worthless if the correct principles governing the process are not followed to the letter.—*The Hub, Sept., 92.*

WITHIN the last few years the Southern Pacific R. R. Company has been building station houses at some of their stopping places. We present a view of one at San Carlos, about twenty-five miles from San Francisco.

THE SUBLIME AND BEAUTIFUL.

By Edmund Burk.

Continued from page 88.

PART I.—THE RECAPITULATION.

To draw the whole of what has been said into a few distinct points:—The passions which belong to self-preservation turn on pain and danger; they are simply painful when their causes immediately affect us; they are delightful when we have an idea of pain and danger, without being actually in such circumstances; this delight I have not called pleasure, because it turns on pain, and because it is different enough from any idea of positive pleasure. Whatever excites this delight, I call *sublime*. The passions belonging to self-preservation are the strongest of all the passions.

The second head to which the passions are referred with relation to their final cause, is society. There are two sort of societies. The first is, the society of sex. The passion belonging to this is called love, and it contains a mixture of lust; its object is the beauty of women. The other is the great society with man and all other animals. The passion subservient to this is called likewise love, but it has no mixture of lust, and its object is beauty; which is a name I shall apply to all such qualities in things as induce in us a sense of affection and tenderness, or some other passion the most nearly resembling these. The passion of love has its rise in positive pleasure; it is, like all things which grow out of pleasure, capable of being mixed with a mode of uneasiness, that is, when an idea of its object is excited in the mind with an idea at the same time of having irretrievably lost it. This mixed sense of pleasure I have not called *pain*, because it turns upon actual pleasure, and because it is, both in its cause and in most of its effects, of a nature altogether different.

Next to the general passion we have for society, to a choice in which we are directed by the pleasure we have in the object, the particular passion under this head called sympathy has the greatest extent. The nature of this passion is, to put us in the place of another in whatever circumstance he is in, and to affect us in a like manner; so that this passion may, as the occasion requires, turn either on pain or pleasure; but with the modifications mentioned in some cases. As to imitation and preference, nothing more need be said.

THE CONCLUSION.

I believe that an attempt to range and methodise some of our most leading passions would be a good preparative to such an inquiry as we are going to make in the ensuing discourse. The passions I have mentioned are almost the only ones which it can be necessary to consider in our present design; though the variety of the passions is great, and worthy, in every branch of that variety, of an attentive investigation. The more accurately we search into the human mind, the stronger traces we everywhere find of His wisdom who made it. If a discourse on the use of the parts of the body may be considered as an hymn to the Creator; the use of the passions, which are the organs of the mind, cannot be barren of praise to Him, nor unproductive to ourselves of that noble and uncommon union of science and admiration, which a contemplation of the works of infinite wisdom alone can afford to a rational mind: whilst referring to Him whatever we find of right or good or fair in ourselves, discovering His strength and wisdom even in our own weakness and imperfection, honoring them where we discover them clearly, and adoring their profundity where we are lost in our search, we may be inquisitive without impertinence, and elevated without pride; we may be admitted, if I may dare to say so, into the counsels of the Almighty by a consideration of His works. The elevation of the mind ought to be the principal end of all our studies; which if they do not in some measure effect, they are of very little service to us. But, beside this great purpose, a consideration of the rationale of our passions seems to me very necessary for all who would affect them upon solid and sure principles. It is not enough to know them in general: to affect them after a delicate manner, or to judge properly of any work designed to affect them, we should know the exact boundaries of their several jurisdictions; we should pursue them through all their variety of operations, and pierce into the inmost, and what might appear inaccessible, parts of our nature,

"Quod latet arcana non enarrabile fibra."

Without all this it is possible for a man, after a confused manner, sometimes to satisfy his own mind of the truth of his work; but he can never have a certain determinate rule to go by, nor can he ever make his propositions sufficiently clear to others. Poets, and orators, and painters, and those who cultivate other branches of the liberal arts, have, without this critical knowledge, succeeded well in their several provinces, and will succeed: as among artificers there are many machines made and even invented without any exact knowledge of the principles they are governed by. It is, I own, not uncommon to be wrong in theory, and right in practice; and we are happy that it is so. Men often act right from their feelings, who afterwards reason but ill on them from principle: but as it is impossible to avoid an attempt at such reasoning, and equally impossible to prevent its having some influence on our practice, surely it is worth taking some pains to have it just, and founded on the basis of sure experience. We might expect that the artists themselves would have been our surest guides; but the artists have been too much occupied in the practice: the philosophers have done little; and what they have done, was mostly with a view to their own schemes and systems and as for those called critics, they have generaliy sought the rule of the arts in the wrong place; they sought it among poems, pictures, engravings, statues and buildings. But art can never give the rules that make an art. This is, I believe, the reason why artists in general, and poets principally, have been confined in so narrow a circle: they have been rather imitators of one another than of nature; and this with so faithful an uniformity, and to so remote an antiquity, that it is hard to say who gave the first model. Critics follow them, and therfore can do little as guides. I can judge but poorly of anything whilst I measure it by no other standard than itself. The true standard of the arts is in every man's power; and an easy observation of the most common, sometimes of the meanest things in nature, will give the truest lights, where the greatest sagacity and industry, that slights such observation, must leave us in the dark, or, what is worse, amuse and mislead us by false lights. In an inquiry it is almost everything to be once in a right road. I am satisfied I have done but little by these observations considered in themselves; and I never should have taken the pains to digest them, much less should I have ever ventured to publish them, if I was not convinced that nothing tends more to the corruption of science than to suffer it to stagnate. These waters must be troubled before they can exert their virtues. A man who works beyond the surface of things, though he may be wrong himself, yet he clears the way for others, and may chance to make even his errors subservient to the cause of truth. In the following parts I shall inquire what things they are that cause in us the affections of the sublime and beautiful, as in this I have considered the affections themselves. I only desire one favor—that no part of this discourse may be judged of by itself, and independently of the rest; for I am sensible I have not disposed my materials to abide the test of a captious controversy, but of a sober and even forgiving examination, that they are not armed at all points for battle, but dressed to visit those who are willing to give a peaceful entrance to truth.

BUILDING LAW.

THE Law News Bureau of Chicago will furnish for publication in the CALIFORNIA ARCHITECT AND BUILDING NEWS, a series of original articles on the laws relating to the building interests. These articles will interest architects, builders and all persons in any way connected with the building trades.

BUILDING CONTRACTS.

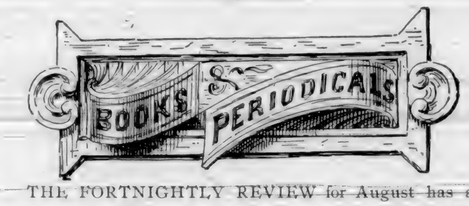
The nature of a building contract is such that it frequently happens, in the course of its performance, that differences arise between the parties to it which render recourse to litigation necessary. A great deal of this could be avoided if in making the contract itself, greater care were used and more attention were paid to the legal principles involved. At the outset of the consideration of the subject of building contracts, it may be said that there is nothing in the law that requires that the contract be in writing unless it is some special statute or provision with reference to mechanics' liens. But as to the validity of the contract itself it is as good verbal as it is written unless by its terms it is not to be performed within one year. This is owing to the operation of the statute of frauds, under which a contract is not valid if by its terms it is not to be performed within one year, unless it is in writing and signed by the parties to be charged. But this does not mean necessarily a contract which is not to be performed within a year, but a contract which by its terms and upon its face cannot be performed within that time. However, as a matter of safety and practical convenience, it is a fact that building contracts are usually reduced to writing. When so written, great care should be exercised for precision of expression that there may be no misconstruction of its terms, and it should carefully provide for all possible contingencies which are likely to arise. The building trade is one which is subject to fluctuations of the market, to the exigencies of the weather and in these days to more or less interruption from labor troubles and all these things which are of common knowledge to the practical builder should be carefully and fully covered in the contract for the erection of a building. It should be borne in mind in entering into a written contract, that when the agreement is reduced to writing, all prior verbal negotiations are merged into that writing, and if there have been any verbal negotiations which are contrary to the letter of the written contract, or if there have been negotiations which are not covered by the contract, the written agreement is supposed to have been entered into with deliberation and to have superceded those prior and informal agreements. It should be borne in mind that the written contract is but the evidence of the agreement of the parties and of itself is of no binding force. Therefore should an agreement be reached and it be reduced to writing and either party fail to sign it that does not affect the validity of the contract itself. Either party upon failure of the other to comply with the terms of the contract, may proceed against the other for damages as if the contract had actually been signed. Of course this principle of the law does not apply to those contracts to which reference has heretofore been made, which are void under the statute of frauds, unless they are reduced to writing and signed by the parties. It frequently becomes the duty of the court after parties have entered into contract to construe those contracts. In the case of agreements involving special trades like building contracts, the language employed is frequently of a technical nature. This language when presented to the court for construction is subject to explanation and definition by persons versed in the trade. Other than that the contract must

stand for construction upon the language which is employed according to the ordinary use of the language. While it is true that the execution of a written contract thereby abrogates any verbal negotiations which may have been entered into by the parties prior to the execution of the writing, it is perfectly competent to modify that written contract after it has been executed by verbal agreements from time to time as the work progresses. For instance, where a contract provides that there shall be in no case any allowance for extra work, if extras are demanded by the owner upon a special verbal contract they are furnished by the builder and the recital in the contract that there will be no allowance for extras will not prevent the contractor from recovering their value provided he can show a special verbal contract. Or, if during the progress of the work, the owner makes such changes in the plans and specifications that it is practically impossible to trace in them any likeness to the plans and specifications upon which the original contract was made, then the builder is at liberty to disregard his original contract both as to terms and price and to charge for the work its reasonable worth and value upon a contract for an agreed price. In one case a contractor found that he was losing money and refused to go on. The owner thereupon verbally agreed that he would make him good for all the labor and stock he might employ, and further said that the contractor should suffer no loss by completing his contract. This agreement though verbal was valid and binding upon the owner and upon the completion of the contract; the builder was entitled to recover in addition to the contract price such an amount as he could show he had expended over and above the price agreed upon in the written contract. These are cases in which the contractor assents to the changes which are made. But if a contract has been entered into with reference to certain specifications and the work is placed under supervision of the architect who prepared the specifications, the architect has no right, without the consent of the contractor, to change the specifications upon which the contract was based. And upon his attempt to do so, the contractor may either abandon the work and recover for what he has already done or if he chooses he may go on and charge such additional price as the changes in the work may make it worth. In making contracts with corporations for buildings the builder should be careful that the contract is one that the corporation or the officers who seek to make it have the authority to make. Corporations being special creatures of the statute are held to a strict enforcement of their charter rights, and unless the contracts which they make are within the scope of the charter which they have from the state, it is in the power of any stockholder to proceed to restrain the completion of the contract. In general, a corporation has the right to erect all the buildings necessary to conduct the business in which it is engaged. To go beyond this they must have special authority either from the stockholders themselves or from the laws under which they operate. Having made a valid and binding contract there are many rights and duties which grow out of it, from which there springs a large amount of litigation. If the parties to these contracts on both sides thoroughly understood their rights and their duties, and knew what the law requires of them and what it would enforce upon them, much of this litigation could be avoided. It is upon that consideration that we shall proceed to consider in future articles some of the responsibilities and liabilities growing out of building contracts. This will include the relations of architects, subcontractors, material men, laborers, and the relations between the contracting parties with reference to breaches of the contract and other responsibilities growing out of the relations of contractor and owner. It is belived that such a consideration of the question will enable the intelligent contractor to avoid many of the harassing features of the business.

The California State World's Fair board has given Miss Ray Beveridge of this city permission to set up and operate a minature blacksmith's forge in the State Building.

Miss Beveridge is a graduate of the Industrial Department of the Cogswell Polytechnic Institute of this city, and is said to be an expert at the anvil. In modeling also she is an artist and bids fair to win fame in that line. Ex-Governor John L. Beveridge of Illinois is an uncle of this talented young lady.

New York is to have a new plumbing law.



THE FORTNIGHTLY REVIEW for August has an article on the "Working Lady in London," by Miss March-Phillipps, giving descriptions of dwellings and lodgings for working people which are of interest to architects.

LIPPINCOTT'S for September has so many interesting articles descriptive of matters on this side of the Continent that it might be called a Pacific Coast edition.

THE COSMOPOLITAN for September has a chapter on the "Advance of Education in the South," giving a description of some of the labor and technical schools.

THE ENGINEERING MAGAZINE for September has an article treating on "Tall Office Buildings, Past and Future" by Dankmar Adler.

THE HUB for September is full of good articles for the wood-worker, among which are the following:—"The Division of Labor in Large Workshops;" "The Abused Grindstone;" "Repairing and Varnishing Old Work;" "Kiln-Drying Hardwood" and "Education of Wood-Workers."

THE CINCINNATI LANCET-CLINIC for September 10th, has a chapter on the "History of Cholera," by T. C. Minor, M. D., and one from J. C. McMechan, M. D. These articles suggest many features of interest to architects engaged in planning hospitals for infectious diseases.

We have received a copy of the introduction to POOR'S MANUAL of the Railroads of the United States for 1892. H. V. and H. W. Poor, publishers, 70 Wall street, New York. It contains a vast amount of useful information, and we shall quote from it at different times during the coming year.

ILLUSTRATIONS

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

THE illustration shows the new residence of Mr. Samuel Taylor, and is to be erected on the site of the old Wolfskill home near Winters, California. The rooms are arranged around an open court 30x30 feet, in which will be a fountain and palm trees. On the level of the second story there will be a balcony seven feet in width, leaving an octagonal opening sixteen feet across. This opening is arranged so that it may be closed with glass in the winter to admit its being warmed.

The exterior is in form nearly a square of sixty-two feet and is designed in simple Spanish Style and the walls are coated with rough cement work on iron laths, giving it somewhat the appearance of an adobe house.

The rooms are spacious and well lighted from two sides. The billiard room and dining room are to be finished with black walnut grown on the place. All other parts will be finished in natural red wood.

The plumbing is to be most complete, with modern fixtures, and the entire house will be lighted, and the heating done by means of hot water. Electric bells and other conveniences will be provided.

Messrs. Percy & Hamilton, of this city are the Architects

THE Study of Cottage at Saucelito, California, is from designs by Mr. T. P. Ross, of this city, Architect.

THE *Wohnhaus des Baumeister* is from the Architectural *Skizzenbuch*, 1874.

THE two detached residences shown in the illustration, are in course of erection on the corner of Broadway and Gough streets for Mr. Walker and are from designs by Mr. W. H. Lillie, Architect, of this city.

The architects of the world are to be invited to a congress at Chicago during the World's Fair to discuss architectural subjects and the interests of the profession.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.

GEO. H. SANDERS, Pres. OLIVER EVERETT, Vice-Pres.
H. T. BESTOR, Sec. JOHN M. CURTIS, Tres.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.

JOHN RICHARDS, Pres. L. WAGONER, Vice-Pres.
OTTO VON GELDERN, Sec. GEO. F. SCHILD, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.

GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
W. I. CROSETT, Sec. O. BROOKS, Treas.

MASTER PAINTERS' ASSOCIATION OF THE PACIFIC COAST.

E. M. GALLAGHER, Pres. H. G. JARMAN, Sec.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Courts of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

LIEN OF ARCHITECT.—An architect is within the protection of the Alabama Code, as a person who has done "work or labor upon * * * a building or improvement on land." But, the description of a building upon which a mechanic's lien is sought to be enforced must be sufficient for a person familiar with the locality to identify it.

Hughes v. Torgerson, Supreme Court of Alabama, 11 South. Rep. 298, 57.

DAMAGES FOR NON-PERFORMANCE OF CONTRACTS.—It is the rule that, in cases of contracts wholly unperformed, such damages as naturally result from the breach of the contract are presumed to have accured to the injured party and may be recovered, and the measure of such damages in such cases should be the difference between the contract price and the reasonable cost of the work or thing, at the usual and ordinary price.

Richter v. Meyer, Appellate Court of Indiana, 31 N. E. Rep. 582, 73.

DAMAGE FROM DROPPING OF MORTAR.—Where a person sustains damage by the dropping of mortar and bricks during the erection of a wall next to the premises occupied by her, the party for whom the wall was being erected, is not liable for such damage, but the contractor would be, if any one, if it was not a necessary result of the building of the wall, but was caused by the negligence of the contractor or of his servants. The injury caused by dust arising from the dumping of loads of brick near a person's residence might be so trifling as not to be actionable, or there might be evidence of such excessive and long-continued annoyance therefrom as to warrant the submission of the question of damage caused thereby to the jury.

Pye v. Faxon, Supreme Judicial Court of Massachusetts, 31 N. E. Rep. 640, 138.

EXTRAS UNDER CONTRACT.—A written building contract provided that the contractor should, to the satisfaction of the architects, perform and finish "all work included in the entire completion" of the building for a named sum, and that he should make no claim for additional work unless the same should be done pursuantly to a written order from the architects, and that written notice of all claims should be given the architects within three days of the beginning of such work. Under this contract in the absence of an agreement modifying it, the builder was not liable for extra

work unless it was done on a written order; and the contractor could recover for extra work if it was done "at the request, or with the knowledge and consent, express or implied," of the builder, "or his agent," without a waiver by the builder of a written order, or of his independent promise to pay for the work.

Wortman v. Kleinschmidt, Supreme Court of Montana, 30 Pac. Rep., 260, 153.

Effect of Changes in Building on Bond for Performance of Contract.—In an action upon the bond of a contractor given for the faithful performance of a contract, for the construction of a building where the contract contained a clause by which the owner retained the right to alter or modify the original design, and to add to or diminish from the contract price, and the owner or the architect were at liberty to make any alteration in the plan, form, construction or detail, described in the drawings and specifications, without making void the contract, and it is found by the referee trying the case, that a change was made in the plan of the building by moving the wall out two inches, and the specifications were changed by substituting walnut, cherry and poplar, instead of pine, in certain portions of the building; these changes and modifications were provided in the contract, and the bondsmen were not released by reason of such changes; and when it is found that the original specifications exhibited to the bondsmen with numerous alterations noted therein, were taken by the architect to be copied, and it does not appear that the additions made upon the copy are material, and the original is inadvertently destroyed in the architect's office, the destruction of the original specification will not avoid the contract or release the bondsmen.

McLennan v. Wellington, Supreme Court of Kansas, 30 Pac. Rep. 183, 229.

One of the features of the California exhibit at the Exposition will be a pampas palace, twenty feet square, which will be erected in the state building. The palace is the contribution of Mrs. Harriet W. R. Strong, of Whittier, Cal., who is a large grower of pampas plumes.

TENDERS TO BE RECEIVED.

Treasury Department, Office Supervising Architect, Washington, D. C., September 6th, 1892. Sealed Proposals will be received at this office until 2 o'clock P. M. on the 4th day of October, 1892, and opened immediately thereafter, for all the labor and materials required for the erection and completion (except plumbing and heating apparatus) of the extension to the U. S. Court House, Post Office, etc., building at Dallas, Texas, in accordance with the drawings and specification, copies of which may be had at this office or the office of the Superintendent at Dallas, Texas.

Each bid must be accompanied by a certified check for a sum not less than 2 per cent. of the amount of the proposal. The right is reserved to reject any and all bids, or to waive any defect or informality in any bid, if it be deemed in the interest of the Government to do so. All proposals received after the time stated will be returned to the bidder. Proposals must be enclosed in envelopes, sealed and marked, "Proposal for the erection and completion (except plumbing and heating apparatus) of the extension to the U. S. Court House, Post Office, etc., building at Dallas, Texas," and and addressed to,

W. J. Edbrooke,
Supervising Architect.

BUSINESS MOSAICS.

An architect's level is an instrument of a new form for general use by architects, builders, graders, sewer workers, ditchers and all other workers who desire a convenient instrument.

The telescope has an adjustable focus and the bubble of the level is in view when looking through the tube. The telescope moves through a vertical arc with vernier scale for observing vertical lines and heights, and is also provided with a three inch compass for setting off angles, and can be readily set and adjusted for horizontal or vertical lines.

The price of the instrument complete with tripod is $33.00, and without tripod but made to set on a frame, $28.00.

This low-priced instrument for this kind of work takes the place of a $200.00 one. This as well as all other scientific instruments are to be had of the A. Lietz Co., No. 422 Sacramento street, this city.

The Roche Harbor Lime Co. have made a new departure in the shipment of lime. The cooperage of their barrels is such that there is no waste. Instead of sixteen staves they make but two. Out of a shipment of 5,000 barrels there was not a barrel broken.

SANITARY PRECAUTIONS AGAINST CHOLERA.

It is a well known fact that the germs of Cholera thrive most in damp cellars, decaying wood, and in all places where decomposition of any kind has set in, but Carbolineum Avenarius still sells at the same price, even with the increased demands for it, and it is well known that as a disinfectant, a wood preservative, a preventative of dampness in places where dampness is liable to take place, Carbolineum has no equal. Property owners will save money both from a monetary and sanitary point. It prevents dampness, dry rot, and fungus in wood, and drives out moisture. People having damp cellars should paint them with Carbolineum, thereby making them dry, and from a sanitary point, a preventative against Cholera.

The most eminent authorities agree that impure water is a source of danger that should always be guarded against, and more especially at times when epidemics prevail.

The most efficatious apparatus for the purification of water is the Rapid Safety Filter, as supplied by the company at 1209 Market street. Try one and you will find that you cannot do without it.

THE J. L. MOTT IRON WORKS' "SUNRAY" HOT WATER HEATER.

A hot water heater of new construction has been placed upon the market by the J. L. Mott Iron Works, of New York and Chicago, a complete view of which is illustrated in Fig. 1 of the accompanying cuts. The heaters are made in twelve sizes, to heat from 350 to 5,000 feet of radiators, and are arranged in batteries to supply heat for 50,000 feet of radiation. Each section is bolted on the one immediately above it so that any one section can be taken out and replaced without interfering with the others, and it is claimed that these separate bolts have the advantage of making a stronger joint and one that will always remain tight under

any change of temperature. The flanges that form the joints between the sections are milled by a machine specially designed for the purpose which makes the surfaces so true that a leak is impossible. Each tier of flues in the upper sections is accessible by separate clean-out doors, so that each set may be cleaned without exposing the others.

The heaters are furnished with a new pattern of rocking grate which is claimed will clear the fire of all clinker and ashes without waste of fuel. It is claimed that the arrangement of fire-pot, the spaces above the fire-pot and the combustion chambers in the top of the heater are new features. It will be noticed in the sectional cut, Fig. 2, that the water spaces are directly over each other; this construction enables all the gases generated by the burning fuel to pass freely to the combustion chamber at the top of the heater, where they are consumed before escaping to the chimney. It is claimed for this method of construction that a higher temperature

FIG. 1. COMPLETE VIEW OF HEATER.

can be maintained at the top of the heater than in the fire-pot, and that the whole of the heater surface is as hot as the fire-box.

The return flues shown in Fig. 3 prevent the escape of the heated gases till the heat has been extracted by coming into contact with the water spaces.

It is claimed by the makers of this heater that the top of any water heater should be the hottest part of it, as the return water enters at the bottom and gets hotter and hotter till it reaches the top, where it escapes up the flow pipes to the radiators. The makers assert that this heater has a positive circulation, that all the water entering at the bottom of the heater is passed directly over all parts of the fire and yet no friction is allowed to prevent the water escaping freely up the flow pipes as soon as it has received all the heat it

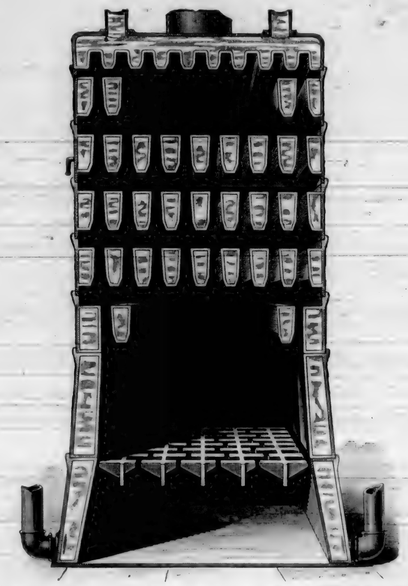

FIG. 2. SECTIONAL VIEW SHOWING WATER SPACES.

can carry. The manufacturers further state the "Sunray" heater has been thoroughly tested to prove its economy, and has exceeded the expectations of the inventors. The heater can be quickly erected and can be taken into any building by an ordinary door. See advertisement on page v.

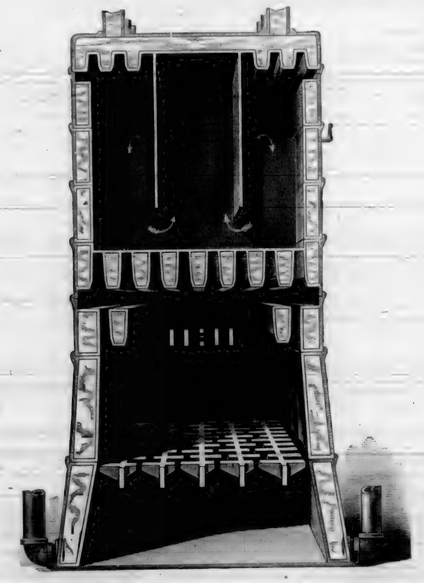

FIG. 3. SECTIONAL VIEW SHOWING RETURN FLUES.

Bartlett near 23rd. Moving two-story frame; owner, Estate of C. Mangels; architect, H. Geilfuss; contractor, P. G. Martin; cost, $2,254; signed, Aug. 18; filed, Aug. 19; payments, 1st and 15th days of each month 75 per cent. as work progresses; balance 35 days.

Broadway near Franklin. To build; owner, J. W. Van Bergen; architect, H. Geilfuss; contractor, F. W. Kern; cost, $10,813; signed, Aug. 2; filed, Aug. 4; payments, $2,027, frame up; $2,027, floors laid and partitions set; $2,027, inside standing finish on; $2,027, completed; $2,705, 35 days.

Broadway near Franklin. Painting, graining, etc.; owner, J. W. Van Bergen; architect, H. Geilfuss; contractor, Wm. G. Koch; cost, $1,200; signed, Aug. 2; filed, Aug. 9; payments, 1st and 15th day of each month 75 per cent. as work progresses; balance 35 days.

Broadway near Franklin. Plumbing, gas-fitting, etc.; owner, J. W. Van Bergen architect, H. Geilfuss; contractor, Chas. Mecham; cost, $1,950; signed, Aug. 2; filed, Aug. 9; payments, 1st and 15th days of each month 75 per cent. as work progresses; balance 35 days.

Broderick and Park Hill Road. Two-story and basement frame; owner, Edmond E. Hill; architects, Shea & Shea; contractor, James McConahey; cost, $6,900; signed, Aug. 16; filed, Aug. 17; payments, $1,218, frame up; $1,219, brown mortar on; $1,219, hard finished; $1,219, completed; $1,625, 35 days.

Bush near Powell. Eight flats and alterations or rear building; owner, Mrs. L. M. Bigelow; architect, J. Cather Newsom; contractors, Belyea & Rogers; cost, $17,350; signed, Aug. 26; filed, Aug. 29; payments, $1,500, excavation completed and foundations in; $1,500, frame of both buildings up; $1,500, rafters up, roof boards on and rough plumbing in; $1,500, enclosed, interiors ready for lathing; $1,500, brown mortar on and outsides primed; $1,500, plastered, and interior finished; $4,000, completed; $4,350, 35 days.

California near Battery. Addition to 4th story; owner, Robt. Sherwood; architect, Clinton Day; contractor, J. T. Grant; cost, $12,881; signed, Aug. 16; filed, Aug. 16; payments, $8,750, brick work completed; $8,000, framing and studding ready for plaster, roof tinned and exterior sashes hung; $2,910, completed; $3,221, 35 days.

California near Gough. Painting; owner, Jos. Hyman; architects, Salfield & Kohlberg; contractor, J. F. Sullivan; cost, $780; signed, July 28; filed, July 29; payments, $280, primed; $300, completed; $200, 35 days.

California near Hyde. Two-story frame; owner, Mrs. C. Comerford; architects, Shea & Shea; contractor, J. F. Klenck; cost, $4,590; signed, July 25; filed, July 29; payments, $860, frame up and rafters on; $860, brown mortar on; $861, plastered; $861, completed; $1,148, 35 days.

California near Montgomery. Steel fixtures for vaults; owners, German Savings and Loan Society; architects, Kenitzer & Kollofrath; contractors, Specialty Manufacturing Co.; cost, $1,477.70; signed, Aug. 6; filed, Aug. 15; payments, $1,108, completed; $369.70, 35 days.

California and Webb. Alterations and additions; owners, San Francisco Savings Union; architect, Wm. Curlett; contractors, Smith Bros.; cost, $83,300; signed, July 12; filed, Aug. 2; payments, at the end of each month, 75 per cent. of value as work progresses; balance 35 days.

Caselli Ave. Cottage and basement; owner, Constantine Holubar; contractor, George Lacky; cost, $1,900; signed, Aug. 9; filed, Aug. 11; payments, $400, studding up; $400, brown mortar on; $400, completed; $360, 35 days.

Castro near Henry. To build; owner, John Frawley; architects, Shea & Shea; contractor, Alfred Hawkins; cost, $3,750; signed, Aug. 17; filed, Aug. 18; payments, $703, frame up and rafters on; $703 brown mortar on; $703, hard finished; $703, completed; $938, 35 days.

WE have received the Twenty-first Annual Report of the Board of Park Commissioners of San Francisco, for the year ending with June, 1892.

In addition to keeping the Park in repair some new work has been done. The principal part of the work done is the building of a macadamized walk, twelve feet in width and six thousand feet in length, and high wire fences built around the bird quarters, and considerable work done on the Ocean Boulevard or Great Highway across the ocean front of the Park. The main driveways have been widened and improved. A beautiful steel suspension bridge (from Rœbling's Sons) has been erected to lessen the danger of collisions of persons with vehicles. Several thousand feet of water pipe have been laid.

The Park Commissions seem to have done a large quantity of work with the limited funds at their disposal. Every dollar expended for new improvements means cost in the future for repairs; thus every year adds to the fund for keeping in order the improvements already done, consequently a smaller amount can be used for new work.

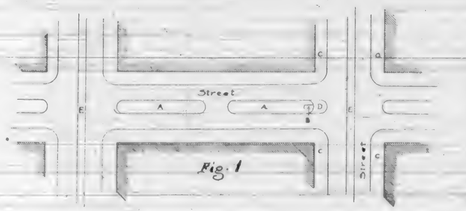
RECENTLY we had the pleasure of visiting the Students' Classes of the San Francisco Chapter of the American Institute of Architects. The Architectural class is under the direction of the President of the Chapter, Mr. Geo. H. Sanders, who has taken a great interest in the classes since their formation some years ago. The class in drawing has attained great proficiency in charcoal and crayon work. Some of their work would do credit to older hands. The architectural modeling class is under the direction of Mr. Victor A. De Prosse, a very able instructor, who is an architect, artist and modeler. The work done by the class is of a kind that will be useful to them in their future work. Both classes are largely attended.

The students are fortunate in having such practical and competent instructors and have made great advancement in their studies.

URBAN SCIENCE.

To the Editor of the California Architect:

IN taking my usual strolls abroad, sundry practical difficulties presented to the proper continuity of my perambulations brought the following thoughts into my head which I have grouped under the title of Urban Science:



this letter being confined however, to one part of that Science, viz.: the laying out streets in relation to Sanitariness and to their adaptability for rapid and unobstructed transit and leisurely and safe pedestrianism.

Urban Science I should define as proper conduct of a city; and its chief branch is Sanitary Science, or the Science of Health as applied to Society. Sanitary appliances in matter of detail have reached a high point of perfection, but the arrangement of these appliances to the best advantage in dealing with large masses of individuals such as we find in a city is not nearly so perfect.

It is surprising to see an enterprising people as we are, or claim to be, still submitting to have our traffic stopped and all manner of inconveniences put up with by the continual tearing up of our roads and excavating of basements.

It seems to me that the reason of this is that no really good remedy has thus far been offered. It may therefore be in order to lay before your readers a system of streets and basement building which will go far to make away with these troubles.

In the first place, a little reflection will immediately show to one the utter absurdity of digging down into the earth for our basements when we have the whole space above into which to carry our buildings.

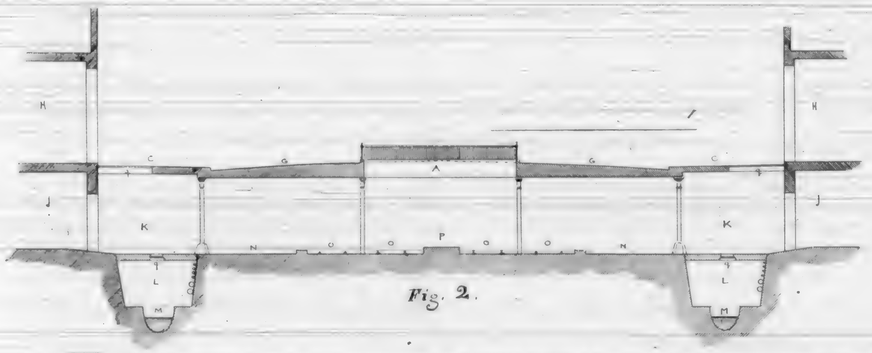
It would be very interesting to investigate the origin of the idea, but we have no time nor space now to enter into this part of the subject; enough it is that the citizen of the latter end of the 19th century persists at a large expense in digging down under the earth to form a dark, damp cellar, often times necessitating constant expense in pumping out the water therefrom while he has the whole space above the earth to build up into. We find him also burrowing into the street and occupying the space under the sidewalks of it. This must arise from what Darwin calls a persistence of the type when our ancestors were moles, as other marks indicate the time when they were pigs.

To remedy this I would propose to make the streets two story and the sidewalks three story.

The lowest story under the sidewalk would contain the sewers, water and gas pipes, electric wires, steam pipes and all the other carrying apparatus for fluids which are now necessary for our life. On the middle or main story, which would be on the same level as the ground, would run under the upper roadway the several motors carrying trains for rapid transit and local passenger traffic and the central space for the pedestrians and for passengers, and on the sides under the walks above would be tramways and railways for trucks and other heavy teaming and for freight cars. All these communicate directly with the basements of the stores on their same level. The top story would be carried on steel beams and arches. The roadway being used for light traffic and pleasure vehicles, while the stores at this level would be the retail stores and the sidewalks would be used by pedestrians for looking into the same and for perambulating. The sidewalks would be partly of glass, thus giving light to the lower street. Large openings would also be left in the center of the upper street for light and ventilation to the lower one. At the crossing of every block would be public elevators, running continuously and automatically, for carrying the passengers from the street cars to the upper level where they debouch onto the sidewalks.

This is a slight sketch of what could be done to make our streets pleasant, clean and safe.

STROLLER.

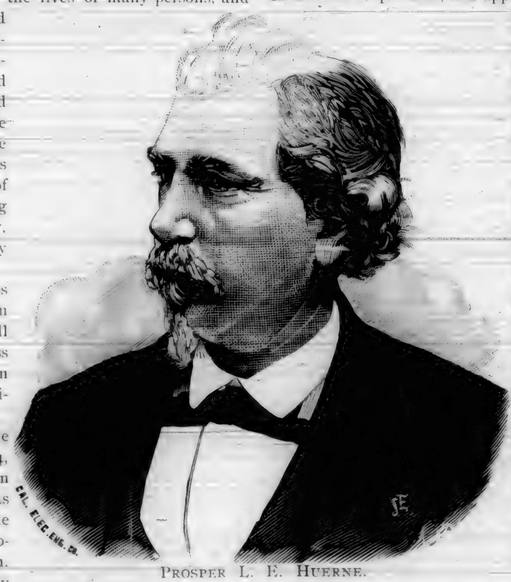


A—Well in center of roadway for light and ventilation to lower regions. *B*—Automatic elevator, a continuously moving inclined plane. *C*—Sidewalks. *D*—Island for reception of passengers, via., elevator. *E*—High level street car tracts for residence streets. *F*—Railing enclosing well. *G*—Roadway for light vehicles, equestrians, etc. *H*—2d story of buildings used as showrooms and display. *J*—1st story used for storage. *K*—Space for backing up drays and wagons; will be finally needless as freight cars running on a railway will supersede them. *L*—Sub-way containing gas and water and electric pipes. *M*—Sewer. *N*—Tramway for drays or freight cars. *O*—Motor railroad cars; one set for rapid transit, the other for local travel. *P*—Platform for passengers and pedestrians. *Q*—Glass Lights.

OBITUARY.

WHERE died in this city on October first, an honored member of the Architectural profession, and a civil engineer of acknowledged capacity; one who in the forty years practice of his professions in this city and on this coast, won the esteem and friendship of all who appreciate the noble qualities of an honest man.

Prosper L. E. Huerne was born at Pontgouin, near Chartres, France, on the 26th of November, 1820. He was educated as a civil engineer in the government school of *Arts et Metiers*, at Chalons, and upon graduating, entered the service of the French government as *Ingenieur Conducteur* in the *Corps des Ponts et Chaussees*, and was rapidly promoted till he became assistant chief engineer; in this capacity he built the great bridge over the River Loire. It was at this time, during the inundation of the river in 1846, that, at the risk of his own, he saved the lives of many persons, and displayed such bravery and good judgment in the perilous task of rescuing the inhabitants of the inundated country from the swift and treacherous currents of the overflowing river, that the government rewarded his services in the cause of humanity, by presenting him with a medal of honor, of which he was justly proud.



PROSPER L. E. HUERNE.

In 1850 he came to this country, landing in San Francisco in June, and till his retirement from business cares two years ago, was an active and enterprising citizen.

As engineer, he built the North Point docks in 1854, and his project for the San Francisco seawall was ranked second among the thirty-three designs submitted in competition. He contracted extensively with the Panama Canal Company for the erection of buildings on the Isthmus, and for dredging several miles of the canal on the Atlantic side, and the energy and skill displayed in the execution of these works, were highly appreciated by the officers of the Canal Company, as a perusal of their letters to him show. He had many correspondents among the members of his profession in Europe, and furnished them with much interesting information concerning the industrial progress of this country, stimulating their interest in the rapid advances made by the newer civilization of the western world.

As architect, he erected the first sugar refinery built in this city by Claus Spreckels, and with a generosity rare in any age, freely donated his services for the erection of the French Hospital in 1857. To mention a fraction of the work designed and executed under his supervision would fill pages.

He acquired skill and experience in mines and mining, and at the day of his death was director in one mining company that had retained his continuous services for over fifteen years.

He was a member of the San Francisco Chapter of the American Institute of Architects, of the California Academy of Sciences, of the Territorial Pioneers of California, of the Exempt Fire Company, of the French National League and other societies.

He enjoyed the blessings conferred by the companionship of a devoted wife, who has the sympathy of numerous friends, yet whose grief can only be assuaged by the faith that he is waiting for her on the other shore.

WORLD'S COLUMBIAN EXPOSITION.

DEPARTMENT OF ART.

To the Architects of All Countries:—The World's Congress Auxiliary is an organization maintained by the World's Columbian Exposition, and approved by the Government of the United States, and has for its object the proper presentation, in a series of Congresses, of the moral and intellectual progress of the world, in connection with the World's Columbian Exposition, to be held at Chicago in 1893.

The World's Congress work is organized in appropriate Departments and General Divisions in which Congress are to be held. The Department of Art includes the general divisions Architecture, Painting, Sculpture, Decorative Art, Photographic Art, Illustrative Art and Art-Literature. The undersigned Committee has been appointed to arrange and conduct a Congress of Architects, under the auspices of the World's Congress Auxiliary, as one of the series mentioned. This Congress will probably be held in the month of August, 1893. This Committee will be assisted by an Advisory Council consisting of the Presidents of Architectural Associations and other eminent Architects selected from the various countries of the world.

The practical objects of this Congress will be to bring the leading Architects of the world into fraternal relations for mutual acquaintance, and the promotion of their mutual interests; to review the progress of Architecture in different countries, and by a comparison of results attained promote the general advancement of the profession of Architecture throughout the world; and to consider the principles of Architectural Art, and the relations of Architecture to the other Arts, Sciences and Industries.

The themes to be selected from those which may be suggested for presentation in the proposed Congress, will be chosen with a view to the most complete summary of architectural progress to the date of the Congress, and the most clear and comprehensive statement of the practical problems with which Architects are confronted at the present time.

Inquiries, suggestions and recommendations, in relation to the proposed Congress, may be addressed to the undersigned Secretary of the Committee.

DANIEL H. BURNHAM, Chairman; WILLIAM LE BARON JENNEY, Vice-Chairman. ROBERT CRAIK MCLEAN, Secretary, 19 Tribune Building, World's Congress Headquarters.

THE GOVERNMENT TIMBER TESTS.

BY B. E. FERNOW, CHIEF OF FORESTRY DIVISION,
U. S. DEPARTMENT OF AGRICULTURE.

LABORATORY WORK WRITTEN BY J. B. JOHNSON.

(Continued from page 82.)

SAWING, STORING AND SEASONING.

ON arrival of the logs in St. Louis they are sent to a saw-mill and cut into sticks, as shown in Figs. 1 to 4.

In all cases the arrangements shown in Figs. 1 and 2 are used, except when a detailed study of the timber in all parts of the cross-section of the log is intended. A few of the most perfect logs of each species are cut up into small sticks, as shown in Figs. 3 and 4. The logs tested for determining the effects of extracting the turpentine from the Southern pitch pines were cut into small sticks.

In all cases a "small stick" is nominally 4 inches square, but when dressed down for testing may be as small as 3½ inches square. The "large sticks" vary from 6 by 12 to 8 by 16 inches in cross-section.

All logs vary from 12 to 18 feet in length. They all have a north and south diametral line, together with the number

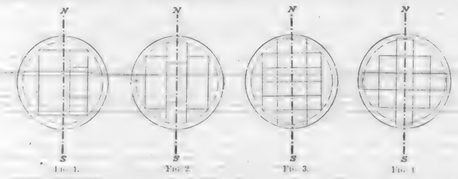


FIG. 1. FIG. 2. FIG. 3. FIG. 4.

The stenciled lines for sawing are adjusted to this north and south line, as shown in the figures.

of the tree and of the log plainly marked on their larger or lower ends.

The stenciled lines for sawing are adjusted to this north and south line, as shown in the figures.

The methods of sawing shown in Figs. 2 and 4 are called "boxing the heart"; that is, all the heart portion is thrown into one small stick, which in practice may be thrown away or put into a lower grade without serious loss. In important bridge, floor, or roof timbers, the heart should always be either excluded or "boxed" in this way, since its presence leads to checking and impairs the strength of the stick.

After sawing, the timbers are stored in the laboratory until they are tested. The "green tests" are made usually within two months after sawing, while the "dry tests" are made at various subsequent times. One end (60 inches) of each stick is tested green, and the other end reserved and tested after seasoning. The seasoning is hastened in some cases by means of a drying box. The temperature of the inflowing air in this drying box is kept at about 100° F., with suitable precaution against checking of the wood, and the air is exhausted by means of a fan. The air is, therefore, somewhat rarefied in the box. The temperature is at all times under control. It operates when the fan is running, and this is only during working hours.

The apparatus pertinent to the timber tests consists of a 1,000,000-pound column-testing machine; one 100,000-pound beam-testing machine, one 100,000-pound universal testing machine, of Riehle's "Harvard" pattern; one small portable beam machine, one 6-horse power Brayton coal-oil engine, one 4-horse power steam engine, one planer and one lathe, for iron work; one planer, one band saw and one cutting-off saw, for shaping and dressing wood specimens; suitable scales, drying ovens, etc., for the moisture and specific gravity tests; the drying box with its steam coils and exhaust fan, and all the necessary appliances, benches, tools, desks, etc., including a Thatcher's slide rule for making the computations.

THE CROSS-BREAKING TESTS.

LARGE BEAMS.—The large beams are tested on the large beam-testing machine. The base of this machine consists of two long-leaf pine sticks (*Pinus palustris*), 6 inches by 18 inches by 24 feet long, with a steel plate three-fourths of an inch by 18 inches by 20 feet long, all bolted up as one beam. The power is applied by hydraulic pressure upon a plunger below, to the crosshead of which are attached the two side screws, on which the upper crosshead is moved by sleeve nuts and spur gearing. The beam to be tested rests on pivots at the ends, placed on top of the base beam, and the upper crosshead is moved down by means of the gearing until the central pivot attached to it comes in contact with the beam, or rather with the distribution blocks placed on the beam at this point. The test then begins, the power originating in a double-plunger pump, operated by hand or by steam power in another part of the room.

To prevent the pivots or "knife-edges" from crushing into the timber, it is necessary to make the contact at both ends and center, first upon a cast-iron plate, then through longer wooden blocks to the timber. The center block is curved somewhat on the lower side, to allow for a considerable deflection in the beam when nearing its maximum load.

In the tests of all beams, both large and small, the load is put on at the same uniform rate, so as to eliminate the time effect, which is very great in timber tests. The load on the small beams is increased at such a rate as to produce an increase in the deflection of one-eighth inch per minute without any pause until rupture occurs. This causes rupture in from ten to fifteen minutes time. The load is read off when it reaches certain even amounts, and an observer notes the corresponding deflection without stopping the test. The time required for the large beam tests is about the same, the deflection rate being greater when the total deflection is expected to be greater, as is the case with 4 by 8 inch sticks 12 feet long. The deflection of the large beams are observed upon a paper scale, graduated to inches and tenths, glued to a piece of mirror, which is tacked to one side of the stick at the center. A fine thread is stretched, by means of a rubber band, over nails driven into the side of the stick above the end supports on the line of the neutral axis. This string or thread is moved about an inch away from the surface of the timber, and all parallax, or error of reading from an oblique position of the eye, is avoided by keeping the eye where the thread and its image in the mirror coincide and form one and the same line. The readings are taken to inches and hundredths by estimating the tenths of the graduation spaces on the scale.

The loads are weighed on the large universal testing machine in another part of the room. This is done by having both machines connected up to the same pump, blocking the weighting machine so that the load on its plunger is transmitted to the scales and weighing beam, and then pumping into both machines. The plungers are of exactly the same diameter; they have similar leather cup packing, and hence the error of this method is simply the difference in the friction of the two plungers in their packing rings. To test the accuracy of this method, and to determine the error, if any, at any time, a nest of calibrating springs was made and tested first on the Emery machine at the United States Arsenal, at Watertown, Mass. The loads were found which corresponded to given deflections, or in other words the stress diagram of these springs up to a 30,000-pound load, which corresponds to a little more than one inch elastic deflection. By repeating this test on the 100,000-pound universal or weighing maching, and then on the large beam machine, and plotting the stress diagrams obtained from each, not only can these machines be compared with each other, but both can be compared or calibrated with the Emery machine at the Watertown Arsenal.

SMALL BEAMS.—The small beams which are nominally 4 inches square and 60 inches long between supports are tested on the small beam-testing machine. This machine

was designed originally for testing cast-iron beams, the load at one end or one-half the load at the center being weighed on a pair of ordinary platform scales. The deflections are read off to thousandths of an inch upon a micrometer screw held in the top iron crossbeam. By this means a rigid connection is obtained, through parts not under stress, from the end supports to the center bearings. The movement of the center with reference to the ends is therefore obtained, regardless of the absolute movements of the parts. The load is put on by the hand wheel and power screw, and the weighing beam kept in balance by putting on overweights and moving the poise. Three men are required to make this test. One moves the power screw, which has one-fourth inch pitch, so as to make one revolution every two minutes, and he continues this uniform motion till rupture occurs. Another keeps the scales balanced and calls off the even hundreds of pounds. Another keeps the micrometer screw in contact with the head of the power screw, reads it for certain even hundred pound loads called off, and records the time of each such reading to the nearest minute, the load, and the corresponding reading of the micrometer screw. Here also the end and center bearings are protected by iron plates large enough to prevent any appreciable distortion from lateral compression.

After rupture occurs the stick is bored for samples from which to obtain the moisture tests, and the uninjured ends sawed off and used for the remaining tests, as described below.

THE MOISTURE TEST.

The borings are taken from two holes, 20 inches from each end, and at about one-third the width of the stick, from either side. These borings are first weighed on a delicate balance then placed in a drying oven, at a temperature of 212° F. until they have reached a nearly constant weight, when they are reweighed. The dry weight is taken as the basis on which to compute the percentage of moisture. Thus, if the original weight is twice the final weight, then there was as much water as woody fiber in the stick, or one-half or 50 per cent of the original weight was water. But when computed on the basis of the dry weight there would be 100 per cent. of water. The advantage of computing the percentage on the dry weight is that it furnishes a constant basis of comparison, whereas if computed on the actual or wet weight the basis on which the percentage would be computed would vary with every change in the amount of moisture.

THE SPECIFIC GRAVITY.

The specific gravity is found by taking one of the end pieces, usually 4 by 4 by 8 inches, measuring carefully its lateral dimensions by calipering them at the middle points of the sides at the central section, measuring the length in a similar manner, and taking the product of these three dimensions as the volume From the total volume and the actual total weight, the weight per unit volume or per cubic foot is found, and from this the specific gravity, which is the weight per cubic foot divided by the weight of a cubic foot of distilled water. It must be understood that all the small (4 by 4 inch) beams are planed up true and rectangular before testing and that all the crosscuts are made by a power saw so adjusted as to cut truly at right angles to the sides. The volume can therefore be very accurately computed from the dimensions as above described.

THE TENSION TEST.

The tension test piece is cut from one end of the broken beam. It is 16 inches long, 2½ inches wide, and 1½ inches thick. Its thickness at the center is reduced by cutting out with a band saw circular segments, leaving a breaking section of some 2½ inches by three-eighths inch. This specimen is then placed between the plane wedge-shaped steel grips, and pulled, the same as a bar of iron, in the Universal Machine. This simple method has been found very satisfactory in practice. For this test care is taken to cut the specimen as nearly parallel to the grain of the wood as possible, so that its failure will occur in a condition of pure tension.

THE ENDWISE COMPRESSION TEST.

Most of these tests are made on sticks 4 inches square by 8 inches long, the ends having been cut perfectly true and at right angles to the sides. They are tested in the Universal Machine, the compression continuing until the stick has been visibly crushed and has passed its maximum load. The crushing usually manifests itself over a plane section, by crushing down, or bending over all the fibers at this section, which may be either a right or an oblique section. The section of failure, however, is seldom at the very end. The slightest source of weakness may determine its position, as a very small knot for example, for knots are a source of weakness in compression as well as in tension.

Some tests are made on columns 40 inches long by 4 inches square on the large beam machine, but these usually fail the same as the short blocks, and not by bending sidewise.

COMPRESSION ACROSS THE GRAIN.

Specimens 4 inches square and 6 inches long are tested in compression across the grain. An arbitrary limit of distortion, namely 3 per cent of the height, has been chosen as a reasonable maximum allowable distortion in practice. This limit is indicated in the test by the ringing of an electric bell, and the load then on the specimen is called the compressive strength across the grain. The same limit has also been found to be very near the maximum load in lateral compression, which is also determined.

THE SHEARING TESTS.

Since timber fails by shearing, or splitting, oftener than any other way this test becomes a very important one. The specimen is taken 2 inches square and eight inches long, and rectangular holes mortised 1 inch from each end, and at right angles to each other. The specimen is then pulled, in the Universal Machine, by means of suitable stirrups and keys. The ends are kept from spreading or splitting by putting on small clamps with just enough initial stress in them to hold them in place. After one end shears out two auxiliary hoops or stirrups are used to connect the key which sheared out to a pin put through the hole at the center of the specimen as shown. The other end is then sheared, and two results are obtained on planes at right angles to each other. In this way the shearing strength is determined on two planes at right angles to each other.

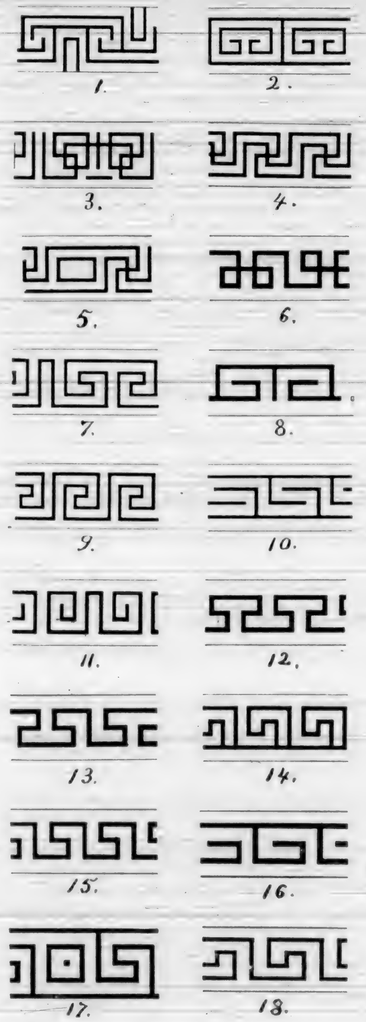
TESTS OF FULL-SIZED COLUMNS.

No set of experimental tests of timber would be complete without numerous tests on full-sized columns. This requires a machine of not less than 1,000,000 pounds capacity, capable of crushing to failure columns from 11 to 14 inches square and at least 30 feet long. Such a machine has been built expressly for this work. It is capable of exerting a compressive force of 1,000,000 pounds on a length of 36 feet or less. The sides or tension members of this machine are made of four long-leaf yellow pine sticks (*Pinus palustris*), from Georgia, each 8 by 12 inches and 45 feet long. The power is applied by the same hydraulic pump which operates both the large beam machine and the 100,000-pound universal machine. The loads are weighed on this latter machine the same as for the beam tests. The plunger in the column machine has just ten times the area of that in the weighing machine, and hence the loads in the column tests are just ten times those indicated on the weighing beam, with a slight correction for the friction differential, which has not yet been determined. The tail block is of cast-iron, resting in a spherical socket, which is carried on a car, and which can be held by struts resting in slots in the timber. The outer ends of these struts are kept from spreading by means of tiebars, and the whole combination can be moved forward or back so as to make the distance between face plates any even number of feet from two to thirty-six. The spherical socket in the tail block will produce an accurate adjustment of the end bearings at the beginning of the test, but after the load is on it is thought that this joint will remain rigid, the same as a solid block, especially if precautions are taken to increase the frictional resistance between these bearing surfaces. This spherical socket is provided to eliminate the effects of unequal shrinkage in the side timbers, or any unequal compression in the bearing sockets, and not to serve as a round-end bearing for the column. When long columns are tested a part of their weight will be supported by means of lines and pulleys, so as to make the test correspond to a vertical load in actual practice.

(To be Continued.)

FRETS have been used as ornament from the earliest period of Architectural history. Their origin appears to have been the reed or bamboo set in broken lines.

The examples shown by the cuts, from 1 to 18, partake of the Grecian character, and figures 6, 8, 10 and 12 may be found in Chinese and Japanese design. In future numbers of this Journal we shall show other examples of frets as illustrated in the architecture of various counties.



¶ Twenty-Three Breaks in One Night.—In one night recently, twenty-three new cracks and fissures were noted in the Chicago government building. The old shell will some day take a tumble and then perhaps the government will see wherein its present policy is what might be politely called foolish.—*Chicago Saturday Blade.*

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

THE double page illustration shows the celebrated wine cellars of Mr. W. B. Bourn, near St. Helena, at the upper end of the Napa Valley. The building and accessories are of stone from that vicinity, and the cellars have been arranged and constructed with all the improvements pertaining to the making, maturing and storing of wines. The product of this vineyard has already become famous and, with the increased facilities, the output will more fully supply the demand.

Messrs. Percy & Hamilton of San Francisco are the Architects.

THE Wallace is in course of erection on Sutter street near Jones street in this city. The basement and main story are of buff colored bricks, and the upper three stories are of wood. The building is arranged for a rooming and boarding house and contains one hundred and fifteen rooms.

Mr. R. H. White is the Architect.

THE design for a Casino is taken from the Architectural Illustrations of the "Intime Club" of 1874. This design was submitted in competition by Mr. Claris, Architect, of Paris.

In the basement, are arranged the kitchen, service and attendants' rooms. The main story contains the vestibule, grand saloon and private dining halls, and in the upper story are the family dining rooms.

IN future numbers of the California Architect we intend to make some improvements and introduce matters of especial interest to those residing in localities where the facilities for obtaining the requisite finish and ornaments are not easily obtained, and thus assist in the development of a love for healthy and convenient homes. When visiting the rural districts we have been requested to give a series of details for work that could be worked by any ordinary carpenter without the aid of machinery. In this particular line we shall give examples for such work, based upon the experience of those who have passed through this ordeal in years already past.

NOTES & COMMENTS.

Advices from Chicago are to the effect that the California Building is about one-third completed. An extra number of men has recently been added to the construction force.

The *Yolo Democrat* says:—The work of laying the sewer pipe of the sewer system of Woodland has been completed. The flush tanks will be placed in position immediately. About seven miles of pipe have been laid since July 6th, and will soon be given a final test.

From the *Sacramento Union* we learn that the people of Sacramento have decided to expend $100,000 for improving the levees, and to place their city beyond all fear of trouble from freshets. At the present time Sacramento is very prosperous and is likely to remain so if assured of safety from the troubles of the past years.

THE AIR LINE SURVEYORS.—The surveyors for the Salt Lake and San Francisco Air Line railroad are making rapid progress toward the east. After coming up the the Feather river they passed through Long Valley to Purdy's switch and then went to the north of Reno abont twenty miles, passing between Pyramid City and Pyramid Lake. They will cross the Truckee a few miles below Wadsworth and thence to the southeast through Churchill county.—*Reno Gazett and Stockman*.

Blank applications for space in the Mechanics' Pavilion at San Francisco for the Preliminary World's Fair Exhibit to be held next January, have just been issued, as has also the full premium list. Detailed information can be had on application to the Secretary of the Mechanics' Institute, J. H. Culver, at 31 Post street, or to C. B. Turrill, General Agent, 63 Flood Building, San Francisco. Intending World's Fair exhibitors by displaying their products at this Preliminary Exhibit will in many cases receive enough cash premiums to recompense them for their entire labor and outlay.

California is to be honored by having a section of one of her famous big trees made a prominent feature in the Government building at the World's Columbian Exposition at Chicago. The project, the accomplishment of which is fully assured, is a unique one. The section of the tree will be twenty-three feet in diameter and thirty feet long. This will be divided into three parts and these will be placed in their natural position, one above the other, and so arranged as to form something like a two-story house. The contract for the tree was made by H. A. Taylor of the Department of the Interior with the King's River Lumber Company in the spring of this year, and the company is now at work getting it out in their forest of sequoia gigantea in the Converse basin on King's river in Fresno county.

The tree selected is one known as the "General Noble." It measures thirty-three feet in diameter near the ground, but as the object was to have the section of the same diameter at both ends, as nearly as possible, a piece is being taken out of the tree at some distance from the ground. To do this and to preserve the section from harm by falling as well as to meet other requirements has proved to be a work of considerable magnitude. The idea is not to send a solid section, but, rather, the rim of the tree hollowed out and cut into segments of suitable size, and all to be numbered so that they can be erected at Chicago, so as to look from the exterior like a solid section of a sequoia thirty feet in height. The three parts into which the section is being cut consist of two parts of fourteen feet each, to be hollowed out, and one, two feet thick, which will serve as a floor between the two stories, as it were.

To get the tree to a point where wagons can reach it required the building of a road two miles long. The tree when erected at Chicago will be surrounded by a glass dome, and will stand directly under the great dome of the Government building.

MYTHOLOGY.

PALLADIUM, a celebrated statue of Pallas. It was about three cubits high, and represented the goddess as sitting and holding a pike in her right hand, and in her left a distaff and a spindle. It fell down from heaven near the tent of Ilus, as that prince was building the citadel of Ilium. Some nevertheless suppose that it fell at Pessinus in Phrygia, or according to others, Dardanus received it as a present from his mother Electra. There are some authors who maintain that the Palladium was made with the bones of Pelops by Abaris; but Apollodorus seems to say, that it was no more than a piece of clock-work, which moved of itself. However discordant the opinions of ancient authors be about this famous statue, it is universally agreed, that on its preservation depended the safety of Troy. This fatality was well known to the Greeks during the Trojan war, and therefore Ulysses and Diomedes were commissioned to steal it away. They effected their purpose; and if we rely upon the authority of some authors, they were directed how to carry it away by Helenus the son of Priam, who proved, in this, unfaithful to his country, because his brother Deiphobus, at the death of Paris, had married Helen, of whom he was enamoured. Minerva was displeased with the violence which was offered to her statue, and according to Virgil, the Palladium itself appeared to have received life and motion, and by the flashes which started from its eyes, and its sudden springs from the earth, it seemed to shew the resentment of the goddess. The true Palladium, as some authors observe, was not carried away from Troy by the Greeks, but only one of the statues of similar size and shape, which were placed near it, to deceive whatever sacrilegious persons attempted to steal it. The Palladium, therefore, as they say, was conveyed safe from Troy to Italy by Æneas, and it was afterwards preserved by the Romans with the greatest secrecy and veneration, in the temple of Vesta, a circumstance which none but the vestal virgins knew.

The FORTNIGHTLY REVIEW for September, has the usual number of original articles.

The COSMOPOLITAN for October, has an article on "Munich as an Art Center," by Charles DeKay.

LIPPINCOTT'S for October, has an article by Edwin Checkley on "Muscle Building," wherein he treats of the "Normal" man or woman as a model.

ENGLISH CATHEDRALS is the title of a new twenty-five dollar work by Mrs. Schuyler Van Rensselaer, illustrated by Joseph Pennell and published by the Century Co., New York.

FIRE AND WATER for September, came out as an elegant "Souvenir Number".

THE BRICKBUILDER for July, gives a number of designs for ornamental brickwork. It is published monthly by the *Brickbuilder Publishing Co.*, 4 Liberty Square, Boston.

The AMERICAN ARCHITECT is publishing a series of valuable papers on Architecture.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.

GEO. H. SANDERS, Pres. OLIVER EVERETT, Vice-Pres.
H. T. BESTOR, Sec. JOHN M. CURTIS, Tres.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.

JOHN RICHARDS, Pres. L. WAGONER, Vice-Pres.
OTTO VON GELDERN, Sec. GEO. F. SCHILD, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.

GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
W. I. CROSETT, Sec. O. BROOKS, Treas.

MASTER PAINTERS' ASSOCIATION OF THE PACIFIC COAST.

E. M. GALLAGHER, Pres. H. G. JARMAN, Sec.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

PERFORMANCE OF CONTRACT PREVENTED.—Where a person contracts with another to do work and furnish materials, and the latter prevents his completing the work though the contract was entire, he may recover the value of the labor done and materials furnished and used.

Joyce v. White, Supreme Court of California, 30 Pac. Rep. 524, 42.

FAILURE TO RECORD BUILDING CONTRACT.—Where a written contract for furnishing materials and erecting buildings is void for failure to record it, as required by the California Code, the party furnishing such materials and erecting such buildings may maintain an action on an implied contract for the value thereof; the Code providing that nothing in the foregoing statute shall be construed to impair or affect the right of any person to whom any debt may be due for work done or materials furnished, to maintain a personal action to recover such debt against the person liable therefor. Such unrecorded contract is not conclusive evidence of the value of the labor and material.

Rebman v. San Gabriel Val. Land and Water Co., Supreme Court of California., 30 Pac. Rep. 564, 112.

NOTICE OF LIEN FOR MATERIAL USED IN SEVERAL HOUSES.—Where several houses are erected by the same contractor for the same owner, and the materials used in the construction are so used indiscriminately, a notice for mechanic's lien for materials furnished is not defective because it does not specify for which particular house the materials were furnished.

Wheeler v. Ralph, Supreme Court of Washington, 30 Pac. Rep. 709, 57.

WHEN SUBCONTRACTOR'S LIEN ATTACHES.—Where a building is constructed under one entire contract between the owner and the original contractor, the liens of all subcontractors, who furnished material or performed labor for the building at any time during the process of construction, attach by relation, as of the date of the commencement of the work, and are entitled to a preference over a mortgage on the premises, executed by the owner subsequent to that date.

Glass v. Freeberg, Supreme Court of Minnesota, 62 N. W. Rep. 900, 74.

ACTION AGAINST SURETIES ON CONTRACTOR'S BOND.—A landowner entering into a contract with a contractor for the erection of a building by the latter took a bond from the contractor, with sureties, conditioned that it should be void if the contractor should pay all just claims for work and material furnished. The contractor having abandoned the contract, the owner himself completed the building, and sued on the bond to recover for the expenditure made by him in so doing. But the sureties were not liable, the breach assigned not being the same as that for which they became responsible.

Holcombe v. Mattson, Supreme Court of Minnesota, 52 N. W. Rep. 857, 99.

ONE CONTRACTOR KEEPING ANOTHER'S CHECK.—In an action for the conversion of a check drawn by the owner of a building to one contractor, and by him indorsed payable to the order of another contractor, it appeared that the check was intended for the latter contractor for the frame work of the building. The former contractor for excavating the cellers, etc., refused to deliver the check, on the ground that he was kept out of money due him by the latter's failure to put in a tier of beams. There was evidence that the beams were not put in because the first mentioned contractor had not carried up the walls high enough. Under the circumstances judgment was given to the contractor for the framework against the other contractor.

Haas v. Altieri, City Court of New York, 19 N. Y. Sup. 687, 127.

POSSESSION DOES NOT AUTHORIZE BUILDING AND LIEN.—The mere fact that one is in lawful possession and control of land does not give one authority to contract for the construction of buildings thereon, so as to give the contractor a lien. Thus it does not follow because one is a trustee or agent to hold and control property that he is authorized to bind the owner by contract which may become liens upon it. Such power must be expressed, or must be shown to arise within the scope of the agency. An overseer, for instance, is an agent to control a plantation, but he could not bind the real estate by contract, or even the crops, without more authority than arises from his agency.

Miller Hardwood Lumber Co. v. Wilson, Supreme Court of Arkansas, 19 S. W. Rep. 125,974.

LIENS ON BUILDINGS ERECTED BY ADJACENT LAND OWNERS.—Where the several owners of two contiguous lots unite in a joint contract for the construction of one building, to be situated in part on each, both lots may, for the purpose of mechanics' liens, be treated as one tract, and a single claim for a lien for labor or material performed or furnished, for the construction of the building may be filed against both lots. But the lien claimant may, nevertheless, in enforcing his lien, cover his claim and obtain judgment against each lot separately, provided he proves what part or proportion of such labor or material entered into the construction of the part of the building situated on each, and provided the rights of third parties are not thereby prejudiced.

Miller v. Shepard, Supreme Court of Minnesota, 52 N. W. Rep. 804, 130.

MORTGAGE BY PARTNER.—A mortgage on real estate executed by one only of two partners in the presence of the other, and with his consent, as security for a firm debt, is binding upon the firm.

Greer v. Fergusen, Supreme Court of Arkansas, 19 S. W. Rep. 996, 36.

PREMATURE FILING OF MACHANIC'S LIEN A LIBEL.—Under the Virginia Code providing that a subcontractor shall not be entitled to a lien on the work in hand until its completion, a subcontractor who prematurely files a mechanic's lien on the work in hand is liable in an action for libel for the injury occasioned thereby to the contractor. It is a settled rule of this common law, that every publication of language that naturally and necessarily tends to injure another in his office, trade, or employment, is, if without justification, libelous and actionable in itself. Where, however, the language does not import such defamation as will of course be injurious, and is therefore actionable only because it occasions special damage, that is, damage which, though natural and immediate, is yet not the necessary result of the language used, there the damage done must be proved. So the filing of a mechanic's lien by a subcontractor as above for an alleged indebtedness to him by the general contractor, cannot be taken, as a matter of law, as imputing insolvency or dishonesty to the general contractor, nor as necessarily tending to injure him in his business. The resulting damage must be proved.

Moore v. Rolin, Supreme Court of Appeals of Virginia, 15 S. E. Rep. 520, 207.

BUSINESS MOSAICS.

The J. L. Mott Iron Works show this month the design of one of their vases which may be used for decorative purposes. Their mammoth catalogue of vases contains a great number of beautiful ornaments for the embellishment of buildings and grounds.

Another man hung his sash with the Samson Solid-Braided Sash Cord, and from that time on the windows have caused no trouble. These cords are very strong and so pliable that the sash moves with an ease and quiteness unknown when other cords are used. See advertisement on last page of cover.

When your white paint begins to chalk off, get soft, turn yellow and loose color or body, try the Phœnix White Lead.

This paint is compounded on correct scientific principals, and its ingredients are combined in such a manner as to withstand to the greatest degree all the destructive influences found on the Pacific Coast.

The salt fogs from the ocean and the moist haze from the overflowed and tide lands have been found to cause the rapid deterioration of paint as usually prepared, while the Phœnix White Lead, when applied in time, has saved the paint already on and added materially to its life. Phœnix White Lead Paint lasts about twice as long as commonly prepared paint. For further information call at the Phœnix White Lead and Color Works, 713 Sansome St., San Francisco.

The balance of power that will insure peace and comfort to all who dwell in houses. A great deal depends upon the condition of the windows of all buildings for health and comfort. Windows that will not open without the aid of carpenter's tools, or that fly open with a bang and cannot be closed, are among the trivial nuisances that exasperate human nature. To have sash balances constructed on a wrong principle and with cheap cord, which easily breaks, attached to your windows, is to court continual trouble. There are many who are not aware that the Pullman Balance Co. have invented a device that has solved the sash balance problem, and for some time past it has been adopted by the most notable architects in America for the grandest buildings ever erected upon this continent.

There is one essential thing necessary on the part of those who wish to use this sash balance and that is *common sense*. The device is known as the Pullman Sash Balance, and is graded into no less than forty-one classes, suitable to the weights of as many sashes, and a man has only to ascertain the weight of his sash in order to procure a balance that is guaranteed to last fifteen years without a single hitch or break. But if a man buys a Pullman Spring Sash Balance suitable for a sash weighing from 4 to 5 lbs. and applies it to a sash weighing about 20 lbs. it will not work, for very good reasons. Sometimes men have done this, and laid all the blame on the device, whereas it all lays upon their own want of common sense. One of the main features in the new invention is the metal tape which replaces the old-fashioned cord, which always broke sooner or later. This metal tape is made of that new, costly and wonderful alloy known as Aluminum bronze which forms a tape that it is almost impossible to break, even by continued hammering when it is doubled up and repeatedly reversed. The new device comprises all the improvements which experience has gleaned in the past, and its simplicity of operation and durability of construction is a marvel of mechanical ingenuity. The frame and face plates are made of cold rolled steel and by locating the brake inside the drum or case, it becomes automatic in operation and applies itself automatically and in proportion to the tension of the spring and there are no screws or bolts to adjust. The face plates being made with oval ends can be fitted with a common auger bit and only require two screws which is a great advantage over the old-fashioned square face plates. The balance is adapted for old as well as new work and can be used in many places where weights and cord cannot. They are easily applied, run noiselessly and have a very attractive appearance. But what is most important next to its durability is the fact that it costs less than any other balance. No slipshod work passes out of the factory. Every article is subjected to severe tests and all material that will not stand the severest ordeals as to quality is rejected. Every balance manufactured by the company is fit for a sample.

A complete line of gas burning appliances, such as cooking ranges, close or open heaters, laundry boilers and driers, etc., are on exhibition at the sale rooms of the San Francisco Gas Light Co., No. 16 Post street, S. F.

The American Roofing Plates furnished by Merchant & Co., Philadelphia, seem to have displaced all other brands of tin roofing.

Art glass windows are the most effective mode of decoration. On entering an apartment where the light is admitted through such windows, the result, especially when there is a harmonious combination of colors, is very pleasing.

Great praise is due to Mr. Wm. Schroeder of 39½ Fremont street, for his artistic work in this line.

Mr. Schroeder has been in the business for a number of years, and has done some of the best work to be found in the city. All the art glass work in the Louvre was done by him, and he has just been awarded the medal at the State Fair at Sacramento for excellent samples of his work.

The largest contract of its nature ever awarded on the coast was that for the bending of the glass for the dome over the central court of the Mills building, and this was secured by Mr. Schroeder, and he is now engaged on its completion. Embossing, beveling, staining and bending in all their branches are performed in his factory.

Samuel Cabot of Boston sends to us a number of colored views of dwellings showing the artistic effects that may easily be obtained by the use of the "Creosote stains" and are intended as suggestions for color treatment. Recently we have noticed some beautiful effects of these stains where good judgment is used when applying them to our redwood shingles; in some examples, the colors were blended gradually from one color to another, and from light to dark or *per contra* of the same color.

While their artistic effects are good these stains are preservative in a high degree and at a time like the present when the "health question" is so prominent, their value is enhanced on account of the disinfecting qualities of their components. Moss, fungus and other forms of growth which engender may of the preventable diseases are rendered inactive or destroyed where these stains are used. Thus the useful is made pleasing and at a less cost than by other method.

Ives Sash Locks still hold their own over others in the market. They are strong and serviceable and become favorites whenever used. They can be had at all first-class hardware stores.

TENDERS TO BE RECEIVED.

Treasury Department, Office Supervising Architect, Washington, D. C., October 7th, 1892. Sealed proposals will be received at this office until 2 o'clock P. M. on the 1st day of November, 1892, and opened immediately thereafter, for all the labor and materials required for the trench excavation, foundations, basement and area walls, basement columns and first floor beams for the U. S. Court House and Post Office Building at Mankato, Minnesota, in accordance with drawings and specification, copies of which may be had on application at this office or the office of the Superintendent at Mankato, Minnesota.

Each bid must be accompanied by a certified check for a sum not less than 2 per cent. of the amount of the proposal. The right is reserved to reject any or all bids and to waive any defect or informality in any bid, if it be deemed in the interest of the Government to do so. All bids received after the time stated will be returned to the bidders. Proposals must be enclosed in envelopes, sealed and marked, "Proposal for the Trench Excavation, Foundations, Basement and Area Walls, Basement Columns and First Floor Beams for the U. S. Court House and Post Office Building at Mankato, Minnesota", and addressed to,

W. J. EDBROOKE,
Supervising Architect.

CITY BUILDING NEWS.

Ashbury near Fell. Painting, plumbing, etc.; owner, M. A. Moddenhauer; architect, W. H. Allie; contractor, Jos. Kennedy; cost, $1,475; signed, Sept. 24; filed, Sept. 26; payments, $521.25 frame on; $521.25, enclosed; $521.25, brown mortar on; $521.25, standing finish on; $521.25, completed; $868.75, 35 days.

Ashbury near Frederick. Two-story frame and stable; owner, W. J. Robinson; contractor, George Healing; cost, $3,190; signed, Aug. 5; filed, Aug. 5; payments, $800, frame up; $800, brown mortar on; $800, doors hung; $800, completed; $800, 35 days.

Brannan and Norton. Two-story frame; owner, George Miller; contractor, Albert Norton; cost, $3,375; signed, Sept. 2; filed, Sept. 2; payments, $843.75, main floor laid and basement finished; $843.75, roof on; $843.75, completed; $843.75, 35 days.

Bryant near Fourth. Three-story frame; owner, Edward Lyons; contractor, M. C. Lynch; cost, $5,150; signed, Aug. 16; filed, Aug. 16; payments, $1,285, frame up and enclosed; $1,290, brown mortar on; $1,290, completed; $1,285, 35 days.

California near Battery. Alterations and additions; owner, Robt. Sherwood; architect, Clinton Day; contractor, J. L. Chrichton; cost, $1,634; signed, Sept. 27; filed, Sept. 28; payments, $600, brown mortar on; $825, completed; $109, 35 days.

California near Buchanan. Alterations and additions; owner, Chas. Knoechel; architect, Chas. M. Rousseau; contractors, Miron & Gardner; cost, $1,000; signed, Sept. 17; filed, Sept. 19; payments, $250, roof on; $250, brown mortar $250, completed; $250, 35 days.

California and Jones. Excavation, concrete, etc.; owner, Geo. Whittell; architects, Coxhead & Coxhead; contractor, Cal. Bridge Co.; cost, $6,907; signed, Sept. 1; filed, Sept. 2; payments, 1st day of each month, 75 per cent. of work done; balance, 35 days.

California near Montgomery. Alterations and additions to a four-story brick building; owner, Isabella Stevenson; architect, H. Geilfuss; contractor, W. A. Miller; cost, $2,127; signed, Sept. 14; filed, Sept. 15; payments, 1st and 15th day of each month 75 per cent. of work done; balance, 35 days.

California near Montgomery. Elevator work on a four-story brick building; owner, Isabella Stevenson; architect, H. Geilfuss; contractors, A. J. McNicoll & Co.; cost, $3,650; signed, Sept. 15; filed, Sept. 15; payments, 1st and 15th day of each month 75 per cent. as work progresses; balance, 35 days.

Caselli Ave. near Douglass. Five-room cottage; owner, Constantin Holubar; contractor, George Lack; cost, $1,333; signed, Aug. 30; filed, Sept. 6; payments, $330, frame up; $330, brown mortar on; $330, completed; $343, 35 days.

Church near 27th. Alterations and additions; owner, A. F. Moore; contractor, W. Plant; cost, $1,210; signed, Sept. 7; filed, Sept. 8; payments, $600, enclosed; $300, plastered; $200, completed; $210, when bills are presented to owner and receipted.

Clay near Larkin. Two-story frame and basement; owner, Mrs. E. Dwarzazek; architect, C. M. Rousseau; contractors, Hodgkins & Kinsley; cost, $4,100; signed, Sept. 7; filed, Sept. 8; payments, $1,000, frame up; $500, brown mortar on; $550, plastered; $1,025, completed; $1,025, 35 days.

Dorland near Church. Two-story frame; owner, Edw. Mitchell; contractor, James McGuire; cost, $3,040; signed, Sept. 27; filed, Sept. 27; payments, $725, frame up; $725, brown mortar on; $750, completed; $840, 35 days.

East and Mission. Additions, millwork, etc.; owners, Kistenmacher Bros.; architect, F. T. Peterson; contractor, R. Herring; cost, $900; signed, Aug. 29; filed, Sept. 13; payments, $650, mill work set up, completed for use; $250, 35 days.

Eddy and Gough. Painting, varnishing, etc.; owner, St. Paul's Lutheran Church; architect, J. E. Krafft; contractor, J. H. Miller; cost, $1,429; signed, Sept. 6; filed, Sept. 7; payments, 1st day of each month 75 per cent. as work progresses; balance, 35 days.

Fell near Gough. Two-story and basement frame; owner, Bertha Kaempfer; architects, John & Balczynski; contractor, Peter Johnson; cost, $3,200; signed, Sept. 3; filed, Sept. 7; payments, $600, frame up; $600, enclosed, floors laid and partitions set; $600, plastered; $675, completed; $825, 35 days.

Fifteenth near Castro. Carpenter work, plumbing, etc.; owner, A. J. Bolfing; architects, Smith & Freeman; contractor, B. J. Malone; cost, $1,023; signed, Aug. 31; filed, Sept. 3; payments, $350, frame up; $417, completed; $256, 35 days.

Filbert near Jones. Two-story and basement frame; owner, Jacob Ohlemutz; architects, John & Balczyski; contractors, Behrend & Heyde; cost, $3,500; signed, Sept. 6; filed, Sept. 7; payments, $600, frame up; $600, enclosed, floor laid and partitions set; $600, plastered; $775, completed; $825, 35 days.

Folsom, No. 2402 Mission Block. To build; owner, Margaretta Both; architects, Townsend & Wyneken; contractors, M. Weber & Co.; cost, $1,081; signed, Sept. 3; filed, Sept. 6; payments, $200, frame up; $200, brown mortar on; $200, plastered and primed; $211, completed; $270, 35 days.

Fourteenth and Folsom; Three-story frame, four flats and two stores; owner, Mrs. Anne Green; contractor, Jno. Foster; cost, $8,000; signed, Sept. 8; filed, Sept. 12; payments, $1,500, frame up; $1,500, brown mortar on; $1,500, plastered; $1,500, completed; $2,000, 35 days.

Geary and Octavia. Lath, plaster, cement and centers; owner, R. M. Black; architect, Wm. Curlett; contractor, Thos. Bodkin; cost, $2,800; signed, Aug. 31; filed, Sept. 6; payments, 1st and 15th day of each month 75 per cent. as work progresses; balance, 35 days.

Geary and Octavia. Gas-fitting and plumbing on seven houses; owner, R. M. Black; architect, Wm. Curlett; contractors, S. Ickelheimer & Bros.; cost, $2,951; signed, Aug. 20; filed, Sept. 18; payments, $1,475, rough work in; $787.75, fixtures set up complete; $787.75, 35 days.

Gough and Eddy. Frame building with brick basement; owner, St. Pauls Lutheran Church; architect, Julius E. Krafft; contractor, Wm. Pluns; signed, Sept. 3; filed, Sept. 6; payments, $2,000, doors and window frames in; $2,000, frames up and sheathed; $3,000, roof, spires and frame sheathed and ready for roofer; $3,000, interior boarding and exterior finish on and window frames set; $3,000, rough floors laid, ceiling sheathed, rough stair work in and partitions ready for lathing; $2,000, floors laid, shingling and finish of ceiling complete, sashes glazed and ready for stained glass; $2,000, interior finish on and exterior doors hung; $2,440, completed; $6,490, 35 days.

Gough and Eddy. Grading, excavating, brickwork, etc.; owner, St. Paul's Lutheran Church; architect, Julius Krafft, contract, Chas. Wagner; cost, $5,380; signed, Sept. 3; filed, Sept. 6; payments, $1,500, concrete walls built and ready for basement floor joists; $2,000, wall up ready for main floor joists; $335, completed; $1,345, 35 days.

Gough and Eddy. Lathing and plastering; ow ner, St. Paul's Lutheran Church; architect, Julius E. Krafft; contractor, Thos. Munnix; cost, $1,355; signed, Sept. 3; filed, Set. 6; payments 1st day of each month 75 per cent. as work progresses; balance 35 days.

Gough and Eddy. Galvanized iron and copper work; owner, St. Paul's Lutheran Church; architect, Julius Krafft; contractors, Forderer Cornice Works; cost, $3,089; signed, Sept. 3; filed, Sept. 6; payments, 1st day of each month 75 per cent. as work progresses; balance, 35 days.

Gough and Eddy. Plumbing, gas-fitting, etc.; owner, St. Paul's Lutheran Church; architect, Julius Krafft; contractor, H. Williamson; cost, $1,164; signed, Sept. 6; filed, Sept. 6; payments, 1st day of each month 75 per cent. as work progresses; balance, 35 days.

Grove and Van Ness. Alterations and additions; owner, Isaac Harris; contractor; J. J. Morehouse; cost, $1,670; signed, Sept. 12; filed, Sept. 12; payments, $835, brown mortar on; $417.50, completed; $417.50, 35 days.

Harrison near 21st. Dwelling; owner, Jas. Laughlan; architect, A. Gordon; contractors, Houston Bros.; cost, $3,085; signed, Sept. 16; filed, Sept. 19; payments, $771, frame up and rustic on; $771, brown mortor on; $771, plastered; $772, 35 days.

Harrison near 22th. Two-story frame; owner, Patrick Canfield; architect, M. J. Welsh; contractor, C. A. Anderson; cost, $2,500; signed, Sept. 13; filed, Sept. 13; payments, $600, frame up; $1,000, ready for lathing; $850, exterior mill work completed; $850, woodwork finished and ready to paint; $895, completed; $1,225, 35 days.

Hayes and Octavia. Four-story frame; owner, Robt. Hubbs; architect, J. C. Newsom; contractor, John Furness; cost, $25,514; signed, Aug. 3; filed, Sept. 16; payments, $3,000, excavation and brick foundation completed; $2,000, 2d floor joists in; $2,000, 3rd floor joists in; $4,000, roof sheathed; $3,500, enclosed and ready for lathing; $2,635.50, outside primed and inside ready for finish; $3,000, completed; $6,378.50, 35 days.

Hayes and Octavia. Plastering and stucco work; owner, Robt. Hubbs; architect, J. Cather Newsom; contractor, J. C. McLeod; cost, $3,000; signed, Aug. 30; filed, Sept. 20; payments, $1,149.75, brown mortar on; $1,149.75, plastered; $766.50, completed.

Hayes and Octavia. Plumbing and gas-fitting; owner, Robt. Hubbs; architect, J. Cather Newsom; contractors, Wm. Snook & Son; cost, $2,294; signed, Aug. 30; filed, Sept. 20, payments, $860.25, rough plumbing in; $860.25, accepted; $573.50, 35 days.

Howard near Eagle. To build; owner, Edward H. Gladwin; architect, C. I. Havens; contractor, John Bruce; cost, $2,360; signed, Sept. 1; filed, Sept. 17; payments, $590, enclosed; $590, hard finished and outside primed; $590, completed; $590, 35 days.

Howard St., Nos. 1502 and 1504. Alterations and additions; owner, G. Raisch; architects, John & Balczynski; contractor, John Sandeen; cost, $3,400; signed, Sept. 1; filed, Sept. 3; payments, $600, porches of former buildings dujished; $650, new frame of 1st story and part of 2d and 3rd stories up; $650, plastered; $650, completed; $850, 35 days.

Howard St., Nos. 1502, 1504 and 1506. Alterations and additions; owner, G. Raisch, architects, John & Balczynski; contractor, J. McCann; cost, $3,500; signed, Sept. 6; filed, Sept. 7; payments, $200, stairs of rear porches of corner building up; $400, new frame up; $650, enclosed and brown mortar on; $800, plastered and outside finish on; $375, completed; $875, 35 days.

Howard near 14th. Alterations and additions; owner, Leonora Krouse; architect, W. C. Dickerson; contractor, August Lund; cost, $2,095; signed, Sept. 7; filed, Sept. 7; payments, $600, frame up; $600, enclosed and brown mortar on; $845, completed; $850, 35 days.

Howard near 19th. Two-story frame with cement foundation; owner, F. C. Howard; architect, C. M. Rossenu, contractor, Geo. Richley; cost, $6,800; signed, Sept. 6th; filed, Sept. 13; payments, $300, excavation and foundation done; $850, frame up; $850, brown mortar on; $850, completed; $950, 35 days.

Howard near 25th. Alterations and additions; owner, T. M. Bickford; architect, M. J. Welsh; contractor, F. A. Worden; cost, $2,200; signed, Sept. 20; filed, Sept. 21; payments, $550, frame up; $550, brown mortar on; $550, completed; $550, 35 days.

Hyde near Post. To build; owner, Alice Moran; contractor, B. K. Albertson; cost, $3,050; signed, Dec. 22; filed, Sept 17; payments, $1,500, enclosed; $1,000, plastered; $550, completed.

Joost Ave., near Acadia. One-story and basement frame; owner, John C. Turner; contractor, Jas. Campbell; cost, $1,925; signed, Sept. 8; filed, Sept. 14; payments, $381.25, frame up, rustic on and roof sheathed; $381.25, brown mortar on; $381.25, completed. $381.25, 35 days.

Larkin near Bush. Three-story frame and brick basement; owners, Thos. Daley and wife; architect, Chas. J. I. Devlin; contractor, F. Klatt; cost, $4,800; signed, Sept. 13; filed, Sept. 13; payments, $600, frame up; $1,000, ready for lathing; $850, exterior mill work is completed; $850, wood work and ready to paint; $895, completed; $1,225, 35 days.

Larkin near Vallejo. Carpenter, mill, stair work, etc.; owner, J. F. Hinrichs; architects, Martens & Coffey; contractor, J. J. O'Brien; cost, $3,876; signed, Sept. 2; filed, Sept. 6; payments, $700, enclosed; $700, outside finish on, floors laid and partitions set; $750, plastered; $750, completed; $976, 35 days.

Liberty near Valencia. Frame building, brick foundation; owner, Stephen Wing; architect, J. E. Krafft; contractor, Daniel Powers; cost, $4,350; signed, Sept. 10; filed, Sept. 12; payments, $1,000, frame up, rustic on and roof sheathed; $1,245, exterior finish on, brown mortar on; $1,000, completed; $1,085, 35 days.

Lott and Grove. To erect a building; owner, Louis Hilbing; contractor, Chas. Sturm; cost, $2,900; signed, Sept. 2; filed, Sept. 7; payments, $750, frame up and roof on; $750, brown mortar on; $750, inside trimming on and doors hung; $850, 35 days.

Market near Powell. Electric work; owner; Annie Donahue; architect, C. I. Havens; contractor, Electric Improvement Co.; cost, $2,050, signed, June 23; filed, Sept. 12; payments, 1st day of each month 75 per cent. of work done; balance, 35 days.

McAllister, No. 337. Carpenter work, plastering, etc.; owner, M. E. Ulmer; architects, Stone & Munsen; contractor, Chas. Condy; cost, $2,070; signed, Sept. 7; filed, Sept. 7; payments, 75 per cent. as work progresses; balance, 35 days.

Minna near Lafayette. All work except plumbing and gas-fitting; owner, C. S. Laumeister; architect, C. I. Havens; contractor, Jas. McLean; cost, $1,080; signed, Sept. 2; filed, Sept. 15; payments, $750, frame up and enclosed; $750, rough gas and water pipes in and brown mortar on; $750, plastered and outside mill work up; $786, completed; $1,012, 35 days.

FOR several months past a number of Architects have been occupied with the preparation of competitive designs for the New French Hospital which the French Benevolent Society proposes to erect.

Two prizes were offered, viz.:—$600 for the first and $400 for the second. The building must accomodate 150 patients and the cost not exceed $180,000.

A large number of plans were received and the committee awarded the first prize upon the plans submitted by William Mooser of San Francisco, and J. Goustiaux of Paris, and the second prize upon those by Emile Depierre.

The property has a frontage of 240 feet on Point Lobos Avenue and a depth of 600 feet. The general plan is upon the separate pavilion system which permits certain patients to be isolated from the other patients.

The December number of the CALIFORNIA ARCHITECT, will contain illustrations of the preliminary plans which were made by Messrs. Pissis & Moore for the guidance of the committee when formulating the rules of the competition, also the first and second prize designs, and such others as we shall be able to obtain, together with a more detailed account of the various designs submitted, and will form a special number devoted to hospital interests. We consider this an appropriate Christmas Souvenir for this enlightened age.

THE summer vacation for the Architects of this vicinity has passed and the members of the profession have settled down to the work of designing the proposed structures which are likely to commence in the spring.

The Chapter A. I. A. has already taken cognizance of some of the irregularities that have been forced into prominence, and many questions of importance have been discussed at their meetings.

The proposition of segregating and placing under separate contracts the different trades meets with some favor but is yet in abeyance.

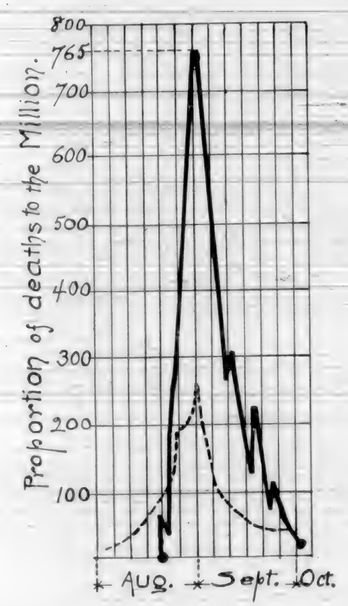
As regards the lien-law, the general opinion seems to be, that, as the lien-law is essentially between the owner and builder, the architect should not be expected to trouble himself about the matter if the owner does not care sufficiently to protect his own interests.

CHOLERA IN EUROPE.

THE United States has so far escaped from the Cholera epidemic which has prevailed so extensively in some of the countries of Europe. It appears that when once the germs of Cholera have been introduced in an insanitary locality it is impossible to say when and with what intensity the epidemic may retire.

The illustration shows the rise and fall of the death rate at Havre and Hamburg. The horizontal lines and figures at the side of the diagram indicate the death rate per one million inhabitants, and the spaces between the vertical lines represent five days each.

In Havre, the first deaths from Cholera occured July 5th, varying in intensity till August 31st, when it reached the proportion of two hundred and fifty deaths to the million (as



shown by the dotted line) then it dropped to the rate of fifty.

In Hamburg, it commenced on the 19th of August and reached the proportion of seven hundred and sixty-five on September 1st, when it receded to a proportion of ten by the end of September. This is shown by the heavy line in the illustration.

In Rouen the epidemic commenced in the later part of July and fluctuated between five and forty till September 20th and 30th, when it reached fifty and then nearly subsided on October 5th.

In Paris it commenced about June and was nearly ended by October 5th. Owing to the care in the sanitary condition of Paris the death rate did not exceed ten.

In Havre, out of the first fifty patients taken to the hospital, forty eight died. At one of the hospitals twelve cases of Cholera were contracted within the walls of the hospital from the cases admitted, when the Cholera patients were sent to another hospital where over one thousand cases were treated and not a single case of Cholera occured within its walls.

This hospital is built on the Tollet system, and consists of isolated pavilions in the shape of the gothic arch, devoid of angles, well ventilated, with light and air on all sides. The rate of mortality was much less in this hospital than the first one mentioned which is built on the block system, several stories in height.

The disinfecting is done by means of stoves, dry heat or steam being used for clothing, bedding, etc. The walls and furniture are sprayed with solution of mercury chloride. The walls are then scraped, scrubbed and whitewashed.

We are indebted to the *Lancet* for the notes for foregoing illustrations and descriptions.

ARCHITECTURAL EXHIBIT.

PAPER read before the San Francisco Chapter A. I. A. by the President, Mr. Geo. H. Sanders.

To the San Francisco Chapter of the A. I. A.

GENTLEMEN:—I beg respectfully to invite your attention to a subject which has already engaged it to a limited extent. I allude to the proposed architectural exhibition in which every branch of art employed in the production of architectural works would be included; and setting forth in practical shape the relationship of architecture thereto as the chief of all the arts.

With this done in an effective way, accompanied by drawings, plans, elevations and sections, and in some cases by details or art on exhibition, it is probable that we, ourselves, would be surprised at the extent and comprehensiveness of the exhibition.

To effect this in a proper manner, would, of course, involve a great deal of careful study, arrangement and expense. Much of the latter should be borne by the exhibitors. It would require a great deal of canvassing to get people to understand the advantage to them, and the bearing their exhibit would have on the whole.

It has occurred to me that if the material (of appropriate architectural character) which will be sent to the World's Fair, could be arranged in one exhibit, with the above in view, supplanted by drawings and other accessories, and such other art works of different kinds as may be procurable, it would seem that the best possible result, at the least possible cost, would be attained.

By judicious advertising a special audience could probably be secured and a series of papers might possibly be prepared and read on several occasions, explanatory of the exhibit, and this would bring out the connection of the exhibits and illustrate the value of architectural style, etc., and the method of its attainment, as well as the necessity existing for the organized effort in the direction of the establishment of art classes or an association which would have for its object the unification of art and the resultant advantages to be thereby attained; also by the organization of a proper school of design under the charge of the Chapter. Such a school would embrace the whole range of architectural design presided over by the professor of architecture attached to the Stanford or California Universities, should such a chair be created in the future. In this way, through the university extension system lately introduced in England, and later in America, and now proposed to be carried out by the University of California, a more or less efficiently conducted system of instruction could be inaugurated leading

to the widely beneficial results. The special classes would be attended by the apprentices and pupils of the different branches of the organization, who would, of course, attend the lectures of the university professor, as well as benefit by the special instruction of the teachers of the school in its subordinate branches. The expense would be partially borne by the pupils themselves, and partly by the contributions of the various departments of the school as a whole.

These would consist of—1st. The Architectural Students. 2d. Students of Decorative Design, Fresco Painters and Furniture, etc. 3rd. Carpenters. 4th. Brick and Terra Cotta Workers. 5th. Metal Workers. 6th. Carvers in Wood and Stone. 7th. Modelers and Plaster Works. 8th. Jewelers, Silver and Goldsmiths, and Engravers. 9th. Lithographers and Wood Cutters. 10th. Sculpture. 11th. Painting. 12th. Engraving, Photographic Work, etc.

In short, of all who would derive benefit, (and who would not) from a knowledge of the true principles of design in architecture.

It might possibly be argued that some of these had better be left to pursue their own course in freedom, evolving their own principles independent of all others and so in a special way working out their own salvation on their own lines, and, independent of all hampering knowledge of architectural taste, developing their own work in their own way.

But it must not be forgotten that Art is one and the one principle obtained in the crystallization of the snow-flake, the growth of the simplest as well as the most complex flower and in the structure of the most highly organized animal as well as in the most complex work of man. All the former, are governed, and the latter should be, by the same law of centralization and subordination of means to ends in the most direct and efficient as well as economical manner, and this, first and last, is Design.

But there is another consideration connected with the above scheme, which, if pursued with energy, might ultimate in the happiest results to architecture. Why could not such an exhibition through the media of the various chapters of the Institute, and by suggestion and example of the Institute itself be brought about at the coming Columbian Exhibition? Important as our own exhibit might be made here as evincing the progress attained in Design in this far-away margin of the Columbian continent, how much nobler a display could be made by a contribution of many such collections from the different states in the Union arranged on similar principles and associated in one great collection in their order of age and development in the greatest exposition of the Arts ever held on Earth?

If one thing more than another would be emphasized, it would be the need of controlling principles in design, and the predominance over all other influences of the Architectural Idea.

This would be seen to be all controlling and universal in everything connected with Art, and it would be at once seen how a beneficial and organized system of instruction and guidance under the above controlling influence would become and how indispensable it is that sooner or later such a system should be introduced.

It seems to me that the right course would have been to have drawn up a memorial to the Institute at its present convention suggesting some such course as is above advocated, even if it involved the construction by the Architects of an architectural exhibition building to receive the exhibits, if space could in no other way be secured.

It would appear from certain notices sent out to the different Chapters and perhaps to individual members of the Institute that in a modified way the above suggestion has already been arranged for, and that an exhibition hall and a collection of some sort has already been provided for.

It is not probable however, that if it is intended to cover anything like the wide extent of art work suggested above, and will, consequently fail in a corresponding degree to effect the desired result. GEO. H. SANDERS.

FIRE-PROOF HIGH BUILDINGS.

THE Fire Underwriters' Association of the Northwest held its twenty-third annual meeting in Chicago, Sept. 27th. Valuable papers and suggestions were presented and a full report of same published by the "*Indicator*," a journal devoted to insurance matters, and to which we are indebted for the following paper by D. J. Sweenie, Chief Marshall of the Chicago Fire Department.

HIGH BUILDINGS—THEIR INTERNAL AND EXTERNAL HAZARD FROM FIRE.

BY D. J. SWEENIE, OF CHICAGO.

To the Fire Underwriters' Association of the Northwest:

GENTLEMEN—So much has been said and so many conflicting opinions expressed through the medium of the daily press, both for and against the modern high building, for examples of which this city is pre-eminent and justly proud, that I fear it is impossible for me to say anything in reference to the internal and external fire hazard of such buildings with which you are not already familiar.

The massive appearance and architectural beauty of our high buildings excite the admiration and wonder of the beholder; but the fireman goes a step farther and takes into consideration the probable chances of such a building becoming a prey to the flames, either during construction or when completed.

When we realize that we have buildings in this city that tower to a height of from 150 to 300 feet, and that a fire is liable to occur in the topmost stories of such buildings, we are free to admit that we must depend to a great extent upon the skill and practical experience of the architect to assist the firemen in protecting them from destruction by fires, by designing and causing to be erected what we can reasonably regard as fire-proof structures. Not alone fire-proof within their four walls, but capable of withstanding the intense heat to which they might be subjected if a fire were raging in adjoining buildings.

Taking up first the internal hazard, this will be governed to a great extent by the use to which the building is to be put, whether for offices exclusively, for office and mercantile purposes combined, or exclusively for merchandise. The two last named classes may be disposed of once for all with the statement, that no style of construction and no building material have ever come under my observation which will render fire-proof a building filled with inflammable goods. In a building of the class under discussion, a fire in a room or floor filled with goods might, in a very short time, gain such headway as to seriously imperil the entire structure by the expansion, warping or twisting of the iron or steel frame-work, and with such a state of facts existing 150 or 300 feet above the ground, it would be next to impossible to do effective work. No building to be used in whole or in part for the storage or sale of merchandise should exceed, in any event, 125 feet in height, and might, with advantage, be much less.

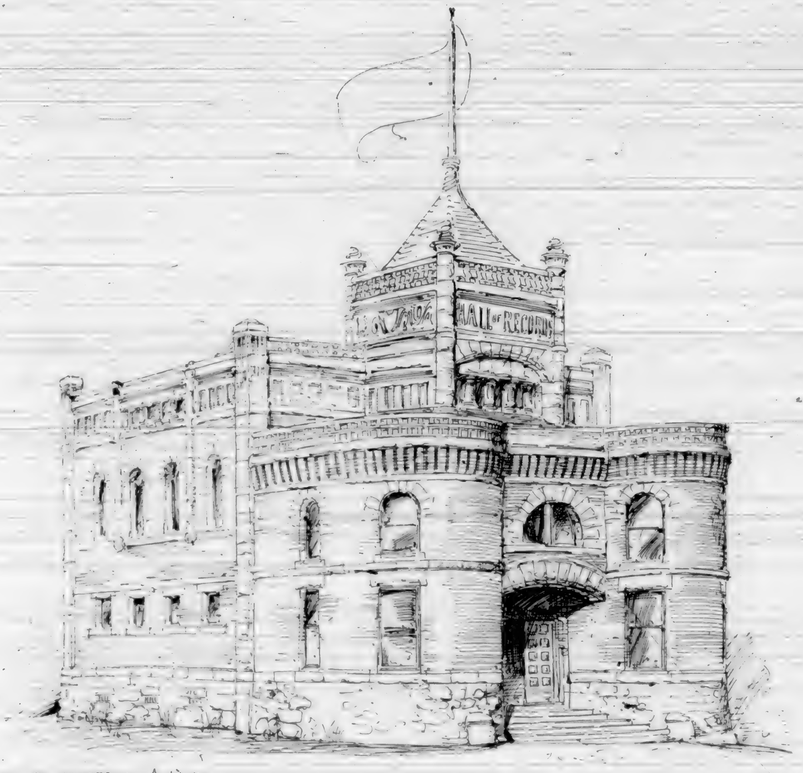
Assuming, then, that our building is to be used solely for offices, I am satisfied that from the point of view we are now discussing, the modern high building is to a reasonable degree fire-proof, where, both in the material used and in the construction, every precaution has been taken into consideration and faithfully carried out to prevent a fire gaining headway in any part of the building.

While such is the case, it does not follow that the greatest care and the utmost precaution should not at all times be exercised to prevent fire, and to promptly extinguish it, should one occur. Each additional tenant increases the hazard, for although the time-honored fire-place and stove have been replaced by steam and hot air, and the candle and kerosene

lamp are giving way to the electric light, the careless smoker and the friction match are still with us. The changes mentioned are not always, however, in the line of safety, for the electric wires require the most careful placing and attention to prevent their becoming a source of danger. As an instance of this:—wires are frequently conducted from floor to floor through a small shaft lined with wood, the wire being fastened to the sides. The danger of this is apparent when we consider that the insulating material used on electric wires, as well as the wooden lining of the shaft, are highly inflammable, and should a fire occur in a shaft of sufficient thickness of non-combustible and non-conductive material to prevent the possibility of its bending or expanding to any serious extent.

We may concede then, that buildings of the class under discussion are, so far as internal hazard is concerned, practically fire-proof. Let us now view them from the standpoint of the external hazard or, in other words, the danger from fire to which they may be subjected from the outside.

Many high buildings of the style now being constructed, have the steel columns supporting them encased in but four inches of brick or tile. In some cases, where there are



SKETCH FOR A HALL OF RECORDS.

this kind, it would be difficult to locate, and afford an excellent avenue for the spread of the flames. To meet this difficulty, I have instructed our inspectors to refuse certificates in all cases where shafts are lined with wood.

The sweepings and waste paper should at once be burned under the boiler or else carried out of the building, and not allowed, under any circumstances, to accumulate. I have in mind two calls on our department from one of the finest high office buildings of the city, and in each case the fire originated in the janitor's waste paper room in the attic.

Before leaving the question of internal hazard, I wish to call attention to the iron and steel universally used in buildings of this class. The iron columns and other metal frame work of the building should be covered at all points with a adjoining buildings, the party wall is used as far as it goes and the iron work placed directly against this wall. This affords practically no protection in case of a hot fire in an adjoining building, or even across the street or rear alley. Sufficient heat is liable to be generated to pass through the brick shell and cause the columns to expand sufficiently to displace the arches, one after another, and thus bring about a collapse of the building. In case the party wall gives way, the iron work is exposed directly to the flames with a like result.

As an illustration of this I may cite a fire which occurred in this city a year or two ago. A building of this description was being constructed and was up several stories, the iron work being directly against the party wall. The joists

of the adjoining building were fastened to the wall with the old style strap anchor, and a fire in the building caused them to fall, the wall went with them, leaving the iron of the new building exposed. The result was that the new frame was so badly twisted and warped as to be useless.

To quote from a recent article on the subject: "No tall building should be erected that does not make use of its own individual side walls, these walls being so constructed and tied to the beams that no falling beam can break them or cause them to fall. These dividing walls should be an absolute barrier against fire, and should not be made thin and weak.

"Architects should remember, that this class of buildings is only assailed by a conflagration, and nothing can withstand a conflagration so well as a standing brick wall. Many architects do not think it necessary to tie the beams to the wall, believing that the weight and friction are enough to hold the walls. This may be all right in ordinary cases, but in extraordinary cases, such as the occurrence of a fire, the walls should be held in position as long as possible."

I fully endorse this and desire in addition to call attention to what I believe a pernicious practice, namely, that of leaving a wall overlooking another building full of openings for windows. In case the lower building is destroyed by fire the heat and flames are almost certain to sweep through these openings into the higher structure with the probable result of destroying it also.

Assuming, then, that the necessity may at any time exist for fighting fire in one of these high buildings, the question presents itself: What preparation should be made on the part of the owners to meet the emergency?

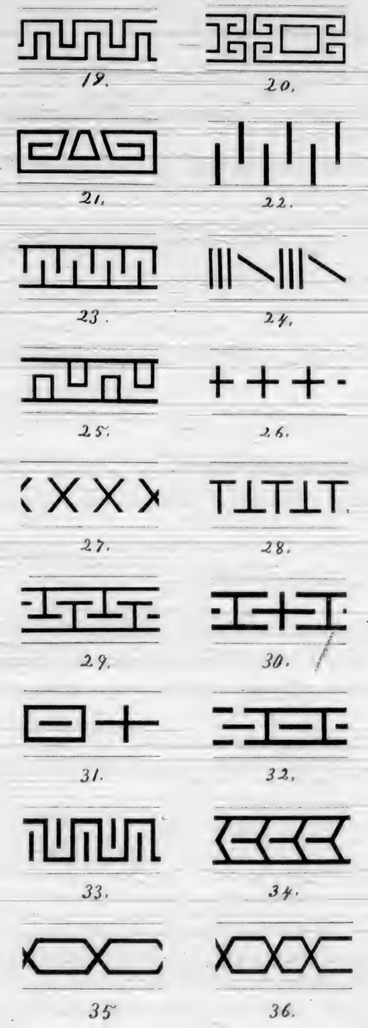
All buildings such as these have ample boiler capacity already at hand, and should be furnished with the necessary pumps to protect the building by providing, in case of fire, an abundant supply of water. There should be a stand pipe extending through the interior to the roof with hose attached on each floor sufficient to reach the most remote corner. Chemical extinguishers should be provided and kept in plain sight and ready for instant use. Each floor should have an electric call communicating with the engine room. All apparatus should be of the best make and provided with the most approved modern appliances. Hose should correspond in size with that used by the fire department, and couplings should have the same thread.

On exposed exteriors there should be lateral perforated pipes connected with a stand pipe, by means of which, in case of fire, a curtain of water could be spread over the sides of the building.

The custodian and his assistants should be thoroughly drilled in the use of the extinguishers and managing the hose and stand pipes. This drill should be frequent enough to keep them in practice, and every one connected with the care of the building should be impressed with the necessity of instantly notifying the fire department whenever a fire, even the most insignificant, occurs. I find on investigation that in nearly all of our high buildings there is no elevator service later than eleven o'clock at night. At least one elevator in a building should at all times be in service ready for instant use, and some one should be on hand to run it the moment the department arrives. Where the fireman has to climb 150 to 300 feet, carrying his appliances, to reach the fire, it is unreasonable to expect of him prompt and efficient work, to say nothing of the loss of time in reaching the field of action.

To sum up the whole matter the modern high building composed of steel or iron frame encased in brick or terra cotta, is as yet an untried experiment so far as its fire resisting qualities are concerned. There is good ground for the belief that a covering of considerably more than four inches would be necessary to protect the frame from a severe blaze continued for any great length of time; but with substantial, solid brick side walls capable of standing alone, and front and rear covering of sufficient thickness and properly anchored to resist the heat to which they are liable to be exposed, where precautions such as I have noted are taken for the protection of the interior, I think the modern high office building may be regarded as practically fire-proof.

FRETS showing examples from 1 to 18 were printed in the October issue and this number contains examples from 19 to 36. Other illustrations of these frets will appear in future numbers.



THE December Number of the California Architect and Building News, will be a Special Hospital Edition and will contain the three designs that were selected by the Committee from the large number submitted in the recent competition. The Journal will also contain other information relating to Hospitals and Hospital Construction. The price of this number will be fifty cents, but subscribers for the year 1893, whose names are sent in before January 1st, will receive this number free. Only a limited number will be printed, therefore names should be sent in early.

SANITATION "IN YE OLDEN TYME".

IN looking over a number of *Our Young Folks*, published in 1866, by Ticknor & Fields, we came across a description by F. W. Newcomb, showing how the plague was stayed in those days.

"One of the principal rites connected with St. John's Eve was the building of great bonfires, around which youths and maidens, gayly decked with wreaths, and bearing bouquets of flowers and sweet herbs in their hands, danced to merry measure. Then they all passed through the flame, leaving their garlands and flowers to be burned, and thereafter considered themselves safe from attacks of ague for the ensuing year. They also believed that, if they looked at the fire through the nosegays they carried, they would insure their eyes thereby from any painful disorder. In Ireland, within not many years now past, it was the custom to build these bonfires on commanding eminences, the heads of families passing through the midst with their households. This is supposed to have been a relic of the ancient worship of the sun, or of Bel (or Baal), the god of fire.

On the other hand, however, the observance is claimed as a tradition of early Christianity; the particulars (from an ancient missal) of the destruction of certain fiery dragons throwing some light upon the origin of the custom, and explaining the title of "bonfires," by which such festival illuminations are still known:—

"In worshyp of Saint Johan the people waked at home, and made three manner of fyres: one was clene bones and noo woode, and that is called a bone fyre; another is clene woode and no bones, and that is called a woode fyre, for people to sit and wake thereby; the third is made of wode and bones, and it is called Saynt Johanny's fyre. The first fyre, as a great clerke, Johan Belleth, telleth, he was in a certayne countrey, so in the countrey there was soo greate hete, the which causid that dragons to go togyther in tokenynge that Johan dyed in brennynge love and charyte to God and man. Then, as these dragons flewe in th' ayre, they shed down to that water froth of ther kynde, and so envenymed the waters and caused moch people for to take theyr deth thereby, and many dyverse syknesse. Wyse clerks knoweth well that dragons hate nothing more than the stenche of brennynge bones, and therefore they gadered as many as they mighte fynde, and brent them; and so, with the stenche thercof, they drove away the dragons, and so they were brought out of greete dysease."

It is a little curious to notice that in the pestilence that was believed to be stayed, as related above, by building bone fires, the cause was supposed to be poisoned water. I believe there is no case on record of the prevalence of the plague or the cholera among a very ignorant people, where the inhabitants were not possessed with the same idea, that the water had been poisoned. Sometimes hundreds of Jews fell victims to the delusion, sometimes hundreds of Christians; and once, in St. Petersburg, not very many years since, during a visitation of cholera, all the hospitals were broken open by the frantic Moujiks, who murdered the French physicians in attendance, under the belief that they had poisoned the wells to rid the city of its crowds of poor.

REMOVAL.—Mr. Fred. B. Wood, Architect, has removed his office to 214 Pine street, Room 57.

A table of lumber measure is convenient to have when making bills of quantities. In the table here given the length of the timber is set off in the upper line ranging from 12 to 30 ft., and the size is indicated in the left hand column. Thus a stick 6x6 in. and 26 ft. long contains 78 ft., board measure.

TABLE OF LUMBER MEASURE.

Size in Inches.	12	14	16	18	20	22	24	26	28	30

THE largest known deposite of iron ore is situated in Durango, Mexico, and yields sixty-five per cent of iron. This iron mountain has been recently purchased by C. P. Huntington, President of the Southern Pacific Railroad Co. The mine has been worked to a limited extent for over a hundred years. Mr. Huntington has in view the erection of the largest iron works in the world and the supplying of the markets of the Pacific Slope, Mexico, South America, Australia and other countries bordering on the Pacific Ocean. The railroad is already extended so as to tap this deposite and it will be but a short time before our market will be supplied from this source.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.

GEO. H. SANDERS, Pres. OLIVER EVERETT, Vice-Pres.
H. T. BESTOR, Sec. JOHN M. CURTIS, Tres.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.

JOHN RICHARDS, Pres. L. WAGONER, Vice-Pres.
OTTO VON GELDERN, Sec. GEO. F. SCHILD, Treas.

THE regular meeting of the San Francisco Chapter of the American Institute of Architects was held the 11th inst. at their rooms, 408 California street.

The question inaugurating a more concentrated action of the members of the Chapter looking towards the advancement of architectural influence in this city and throughout the Coast, was discussed at length and laid over for future action.

Nominations of members were made for election at the next meeting to fill the offices for the ensuing year.

The proposition of purchasing some books offered to the Chapter was referred to the committee on "Students' Classes."

The committee on "Students' Classes," made the following report:

To the Officers and Members of the San Francisco Chapter of the A. I. A.

GENTLEMEN:—The committee to whom was referred the students' competitive designs for a Country Library makes the following report:—

No. 1. The design by C. A. Meussdorffer as being first in merit. The drawing shows study and good workmanship. The plan, in general, is cut up into too many small rooms. The entrance and vestibule leading directly into the library are well arranged.

No 2. The design by Lewis Hobart comes next in merit. The plan partakes more of the character of a library. The vestibule has the main entrance directly into the library. The book cases and the ante-rooms are conveniently arranged. The exterior shows originality but some defects, viz.:—the window space is deficient for lighting the rooms. The lower portion would show an improvement if the water-table or string-course had been placed at the height of the cornice of vestibule and annexes so as to form a continuous tie.

No. 3. The design by Henry N. Meyers shows the plan as cut up into too many small rooms and the turn to the left after entering the vestibule in order to reach the library room detracts from its good features. The exterior shows study in the design and the lighting is good. The drawing is well executed.

No. 4. This design by Emil Blanckenburg shows a two-story building arranged for a street facade. The plan shows too many small rooms but the main entrance leads to the library which is commendable. The library is arranged in two stories, the upper story forming a balcony around the main room. The small stairs in the room leading to the balcony would be a convenient arrangement for the attendants, but the principal stairway which is placed outside the main hall seems unusually large for the rooms on the upper floor.

Your committee would suggest that the competitions of the "Students' Club" should be conducted under certain defined rules, and that the instructions should be explicit and should state the limits of cost or size in some way, and if a church, the denomination or form of worship should be given in order that the Judges may have a clear idea of the *motif* before deciding on the merits of the different designs submitted.

All of which are respectfully submitted by

ALBERT PISSIS,
OLIVER EVERETT,
W. J. CUTHBERTSON,
H. T. BESTOR,
COMMITTEE.

The question of separating the Plasterers' contracts from the general contract was referred to a committee.

Upon request of the California Electrical Society, a committee was appointed to confer with a like committee from that society, with a view to the adoption of some system that will tend to improve the quality and character of electrical works in buildings, thereby reducing the fire risks.

The President of the Chapter, Mr. Geo. H. Sanders, presented a paper relating to architecture taking the lead in art work. This paper will be found in full on another page.

Mr. Sanders read the following paper on a system for the studies to be taken by the Class of Students, which was ordered printed and the members requested to give the subject the consideration necessary for the discussion set for the next meeting.

To the San Francisco Chapter A. I. A.

GENTLEMEN:—With reference to the recommendations which were adopted by the Chapter in regard to the awards of Bronze, Silver and Gold Medals to students, draughtsmen and assistants belonging to the Chapter classes, respectively, it seems necessary to adopt some additional regulations for the coming year to the end that a scheme of consistent studies and competitive exhibits should be arranged, so that the students may be enabled to follow the same in such order as shall enable the Chapter to award the said medals intelligently, and so as to be productive of the best results to the students themselves. To this end the following curriculum of studies, subjects of competition and text books are submitted for your approval.

FIRST.

FOR BRONZE MEDALS (TO STUDENTS).—TECHNIC PERIOD.

A—TECHNIC. The best exhibit of practical geometry, arithmetic and algebra, (neatly executed examples inscribed in a book) together with principles of surveying and leveling.

B—ÆSTHETIC. Examples of the Greek and Roman Orders with diagrams showing entasis, volutes and mouldings.

C—PHONETIC. Free-hand studies (flat) in charcoal, crayon or monocrome aqua-tint, together with sketches of natural foliage.

D—Books to be studied, Pugin's Principles, Nicholson's Architecture, or similar elemental works.

SECOND.

FOR SILVER MEDALS (AWARDED TO DRAUGHTSMEN). ÆSTHETIC PERIOD.

A—TECHNIC. The best exhibit of applied mathematics as indicated in problems of strength of materials, systems of framing, girders, columns, piers, foundations, graphic strains, etc.

B—ÆSTHETIC. Examples of the styles, specimens of detail (Gothic and Classic) together with other styles and

national peculiarities of style. Free-hand drawings from models, pen and ink copies of drawings, and studies in tint and line. Competition designs of architectural detail. Doors, windows, chimneys, dormers, arcades, fountains, niches, statues and architectural ornaments, cottages, lodges and summer houses.

C—PHONETIC. Modeling, carving (copies). Studies of foliage (original).

D—BOOKS. Guilt, Seven Lamps and other similar books.

THIRD.

—COLD MEDAL. (ASSISTANTS). PHONETIC PERIOD.

A—TECHNIC. Details of construction in stone, marble, brick, iron, wood and metal.

B—ESTHETIC. Original designs for ornamental work in various styles, in monocrome, polycrome and pen and ink. Competition designs for halls, chambers, residences, hotels and institutions.

C—PHONETIC. Original models, statuary, original carving, metal work, essays, etc.

D—BOOKS. Fergusson, Stones of Venice, Violet le Duc, Discourses and other books of that character.

The above is suggested as a statement of the average result to be placed within the reach of every student of a five years' course of study, with the average opportunities offered in most offices of fair practice, and it is thought would have the effect of directing the students' attention to works within their capacity, and commensurate with the experience attained by them at the respective periods above indicated. It would seem that such a scheme would economize effort by avoiding ambitious attempts beyond their power at given periods, and would have the effect of leading them, step by step, into the higher realms of architectural design, in a systematic way, instead of fostering vanity at the expense of their intellect and understanding, by premature development on wrong lines, at the same time affording to each student absolute freedom of action, from first to last. —

GEO. H. SANDERS.

THE FORTNIGHTLY REVIEW for October contains an article on the "Trend of Trade Unionism" by H. W. Massingham, a chapter on "Raphael" by Walter Pater, and other articles on various subjects.

LIPPINCOTT'S for November has some interesting chapters on "Form in Driving," "Men of the Day," besides the stories and reviews.

DIE RENAISSANCE-ARCHITEKTUR ITALIENS. Aufrissé, Durchschnitte und Details in 135 lithographirten tafeln. Aufgenommen und mit Erlauterndem Texte Herausgegeben von Fr. Peyer Im Hof, Architekt. Erste Sammlung, Leipzig 1870, Verlag Von E. A. Seemann.

The text of this work is in German, and is illustrated with 135 finely etched line engravings, printed on heavy paper, of the most noted examples of Italian Renaissance. It is a work that when seen will be sure of a purchaser, and we know of no other book so fully worth the price to the student of Architecture as this one. Size 6x9 inches and ¾ of an inch in thickness. Price $3.00. For sale by Messrs. Osborn & Alexander, 401 Market street, San Francisco, Cal.

The following books have been received too late for full reviews in this issue, but we shall give more extended notices in future numbers.

"A Manual of Industrial Drawing for Carpenters," William T. Comstock, N. Y., publisher.

"The Steam Engine," "The Drainage of Habitable Buildings," "Electric Lighting Specifications," "Electrical Dictionary." All of which are for sale by Messrs. Osborn & Alexander, 401 Market Street, San Francisco, Cal. They will also have for sale next week an English edition of "Vignola."

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

THE design "IDLE WILD" is a sketch by Mr. Clarkson Swain for a residence to be erected in the suburbs of this city.

THE illustration of a Library for a country town shows the design submitted by Mr. C. A. Meussdorffer which received the first mention in the recent competition of the Sketch Club of the San Francisco Chapter A. I. A., the report of which will be found on another page.

THE design for Trinity Presbyterian Church recently erected on the corner of Twenty-Third and Capp streets, is by Messrs. Percy & Hamilton, Architects. The basement is built of buff-colored cement bricks with sand stone trimmings; and above this the building is constructed of frame work, the exterior being shingled. The roof timbers are finished to show the construction. The basement contains the Sunday school rooms and parlors, and the auditorium is over them.

THE sketch of the buildings near the Cathedral in Milan is by Mr. Daniel Polk. The view is taken from the south-east and shows one of the purest examples of Italian Renaissance outside of Florence.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

A MECHANICS' LIEN.

WE are indebted to the *Sacramento Weekly Union* for the following:

The decision of the Supreme Court in the case of George Slight vs. G. S. Patton et al., respondents, was filed in Deputy Clerk Govan's office yesterday.

The action was brought in Tulare County to enforce a mechanics' lien. A general demurrer to the complaint was sustained, and plaintiff having declined to amend his complaint, judgment was rendered in favor of defendants. The plaintiff appealed from the judgment-roll and contended that the court erred in sustaining the demurrer to his complaint.

The complaint shows that plaintiff was a sub-contractor, with Thompson and Gamble, who were the original contractors with the defendant, Patton, to build and paint for the latter, on his land, a house and barn, and certain other structures; to furnish all the materials therefor for the gross sum of $5,775, payable on the completion and acceptance of said buildings and structures or within ten days thereafter; that no part of this original contract price was made payable thirty-five days after the completion of the contract; that the work was commenced by the original contractors on or about the 20th day of July, 1889, and completed November 20, 1889; and that neither said original contract, nor any note or memorandum thereof, was ever filed in the office of the Recorder of the county in which said structures were to be built.

Plaintiff further averred that, after the original contractors had commenced the erection of said buildings (on or about August 30, 1889,) plaintiff entered into a contract with them whereby it was agreed that he should do all the painting of said buildings and furnish all the materials therefor, according to the plans and specifications, for the sum of $541.70, to be paid within a reasonable time after the completion of such painting; and that plaintiff duly performed his contract with the original contractors to paint said buildings, and completed the same on the 20th day of November, 1889, on which day the buildings were completed.

The complaint then proceeds to state the filing and recording of plaintiff's notice of lien within thirty days after the completion of said buildings, a copy of which notice is exhibited as a part of the complaint.

The Supreme Court, in considering the objections to the complaint, goes into a particular statement of the portions of it alleged to be insufficient, at great length, and they reversed the judgment and remanded the cause, with instructions to the lower court to overrule the demurrer and proceed in the cause.

CONTRACTORS AS TRESPASSERS.—By exceeding the conditions of an agreement permitting building contractors in erecting a building on an adjoining lot, to enter a person's premises to shore it up, the contractors thereby become trespassers. The damages in such case include loss of profits sustained on account of the contractors' unlawful acts.

Capel v. Lyons, City Court of N. Y., 20 N. Y. Sup. 49.

LIABILITY OF EMPLOYER OF CONTRACTOR.—Where a person owning a lot adjoining another, contracts with a blaster to excavate rock on his premises that forms part of the stratum on which the adjoining house rests, and cannot be blasted without injury to that building, he is not excused by that contract, from responsibility for injuries to that house resulting from blasting the rock, since the act itself, and not the manner of doing it, is wrongful, and he may be enjoined from continuing the excavation in that manner.

Brennan v. Schrolner, Superior Court of New York, 29 N. Y. Sup. 130, 87.

LIEN FOR BUILDING ERECTED BY PURCHASER UNDER CONTRACT.—Where a land-owner entered into contract for the sale of property which was afterwards forfeited for the default of the purchaser, and in the meantime the latter had gone into possession, and erected a house on the land, certain parties furnishing to him materials and labor therefor, on account of which they sought to subject the estate of the land-owner to liens, the contract for the sale of the land making no provision for the construction of buildings except (in substance) that all improvements that might be made should become the property of the vendor, this last mentioned clause added nothing to the legal effect of the contract and the case came under the provision of the Minnesota Statute subjecting the estate of a land-owner to lien for improvements made by others with his knowledge unless he shall give the notice of his want of consent as therein prescribed, which also casts upon the land-owner the burden of excusing his default to comply with the law.

Wheaton v. Berg, Supreme Court of Minnesota, 52 N. W. Rep. 926, 170.

NO LIEN FOR MATERIALS FURNISHED CONTRACTOR.—The statute of Washington providing that every person furnishing materials to be used in the construction of any building shall have a lien therefor, whether furnished at the instance of the owner of the building or his agent, a mechanic's lien cannot be maintained against the owner of a building for materials furnished in its construction that were furnished the contractor in his own name, when the material man had no knowledge of any contract relations existing between the contractor and the owner, nor of the particular building to be constructed, but intended to hold whatever building the materials used in, as security.

Whittier v. Puget Sound Loan, Trust and Banking Co., Supreme Court of Washington, 30 Pac. Rep. 1094, 104.

PAYMENTS WITHOUT CONSENT OF SURETY INVALIDATE CONTRACTOR'S BOND.—A contractor entered into a written agreement with the owner to furnish all materials, and erect for him a building in accordance with certain plans and specifications, and deliver the same free from all liens for labor or material; and the contract further provided that the contractor was to receive therefor a stipulated sum, payable as the work progressed on the estimates of the architect, less 15 per cent, which was to be retained by the owner until the expiration of 90 days from the completion of the work, and then was payable only in the event that there were no liens upon the property for labor or materials supplied through the contractor. A bond was given by the contractor, with sureties, to complete the building according to the contract, and turn the same over to the owner discharged of all liens. Payments in excess of the 85 per cent provided by the contract, were made to the contractor without the consent of the sureties, during the progress of the work, without estimates of the architect. These payments excused the sureties from liability, as it deprived them of the protection of the reserved 15 per cent to which they were entitled.

Bell v. Paul, Supreme Court of Nebraska, 52 N. E. Rep. 1110, 196.

BUSINESS MOSAICS.

The December Number of the CALIFORNIA ARCHITECT AND BUILDING NEWS will be an extra hospital edition. Price fifty cents and free to new subscribers for 1893.

The Hercules Gas or Gasoline Engines have so many excellent qualities that they have given satisfaction wherever used. One of these machines can be made to run an electric plant for lighting shops or factories and as a cheap way of applying power for a great variety of uses. Messrs. Palmer & Rey of this city are the agents.

The California Architect AND BUILDING NEWS is desirous of having active agents in every city and town. Those wishing to act for us will please address this office.

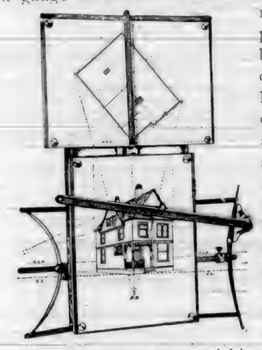
The new catalogue of Messrs. Gladding, McBean & Co., of 1358–1360 Market street, shows some new designs for ornamental terra-cotta tiles, and their improved hollow tile partitions and arches. This firm is one of the few that has kept ahead of the times and was prepared to execute new designs from Architectural drawings.

The Graphite productions of the Jos. Dixon Crucible Co. have steadily advanced and are now far ahead of all others in that line. The manufactures of this company have withstood the test of time and gained in popularity wherever used.

Their list of preparations comprises more than seventy-four articles prepared for special uses. A small can of graphite grease may be readily handled and is of great use to tip on the ends of screws as it lubricates them so that they can be easily set up, and prevents them from rusting; consequently they may be withdrawn without tearing the heads. Dixon's Graphite Paint has no superior for the preservation of metal work where a dark color is permissible.

Perspective drawings and the appliances for simplifying the making of them have been the subject of much thought. Many methods have been tried, but the machine herein shown seems to include so many advantages to the draughtsman that we give a detailed description of its construction.

The frame is of wood and carries metal arms upon which slide grooved guides. To these guides are fastened steel springs which can be set to any desired radius by means of a gauge on the center arms. The center of said curve or radius will be the vanishing points of the perspective to be drawn. By placing a common T square with the head on the outside of the curve or arc, with the blade across the board, it will be seen that when the blade stands horizontally across the board, the true horizon lines will appear, while if moved above or below this point, a line drawn along the blade will be at an angle to the horizontal, but always directly toward the center of radius or vanishing points. (See fig. 1 and 2.) These curves can be set so the centers will be any desired distance from 100 to 10,000 ft. from center of board or picture plane line. The point of sight is obtained in the same manner as horizontal vanishing points, (see fig. 4) and by means of a pin connection with point of sight rule and T square at the picture plane line any point on the plan can be transferred to the perspective without drawing any lines toward the point of sight or taking any measurements at the picture plane line. By placing the hole in the end of the T square over the pin in the point of sight rule, and the head of the T against the bottom of the board (as in fig. 3) and moving the square to the left, the point of sight rule will move with it, and by stopping at any desired point on the plan, the corresponding point on the perspective will be shown at the edge of the T square, which when used in this connection always remains perpendicular. While the point of sight rule always points toward the center of the arc which carries it, (See fig. 4.) or toward the point of sight. By this means the points on the plan are transferred to the perspective direct and saves a multitude of lines, erasures and measurements, thereby saving much time in making true perspectives.



The Kieckhefer Elevators are gaining in favor with those who desire a superior article in this line. Architects and persons interested and who have not yet decided, will, in about two weeks, be able to inspect the Hydraulic High-Speed Elevator having all the latest improvements and which is being put into the new "Examiner Building" in course of erection on Mission street, near Third street in this city. When carefully examined its adoption is sure to follow.

Mr. Chas. A. Hare, the Agent for the Celebrated Gardner Sash Balance, is having printed a handy reference card containing the table for lumber measure shown on page 126.

These cards may be had free upon application at Pier 5, Steuart street, San Francisco.

The superiority of their goods is so well known, that when the J. L. Mott Iron Works is mentioned, no one challenges the quality.

J. L. Cahill, Painter and Decorator has removed from 932 Mission street to 107 Sixth street near Mission, where he has increased facilities for his business which had outgrown the old stand.

Sheet metal work for cornices, ornaments, roofs, etc., from the establishment of Wm. Cronan, 1213-1215 Market street, stand unrivaled. The best approved machines are here used for bending and joining the ornamental projecting finish on the exteriors of buildings.

TENDERS TO BE RECEIVED.

Treasury Department, Office Supervising Architect, Washington, D. C., November 3rd, 1892. Sealed proposals will be received at this office until 2 o'clock P. M. on the 1st day of December, 1892, and opened immediately thereafter, for all the labor and materials required for the trench excavation, foundations, cut stone and brick work of the basement and area walls, basement columns, first floor beams, etc., for the U. S. Post Office Building at Burlington, Iowa, in accordance with drawings and specification, copies of which may be had on application at this office or the office of the Superintendent at Burlington, Iowa.

Each bid must be accompanied by a certified check for a sum not less than 2 per cent. of the amount of the proposal. The right is reserved to reject any or all bids and to waive any defect or informality in any bid, if it be deemed in the interest of the Government to do so. All bids received after the time stated will be returned to the bidders. Proposals must be enclosed in envelopes sealed and marked, "Proposal for the Trench Excavation, Foundations, Cut Stone and Brick Work of Basement and Area Walls, etc, for the U. S. Post Office Building at Burlington, Iowa," and addressed to,

W. J. Edbrooke,
Supervising Architect.

CITY BUILDING NEWS.

Adair near Howard. Two-story frame; owner, C. B. Randall; contractor, C. R. Randall; cost, $3,400; signed, Oct. 25; filed, Oct. 26; payments, $850, roof on; $850, brown mortar on; $850, completed; $850, 35 days.

Bay near Kearney. One-story frame, two stores; owner, Geo. Leviston; architect, P. R. Schmidt; contractor, Jas. Cochrane; cost, $1,900; signed, Oct. 29; filed, Nov. 2; payments, $500, roof on inside ready for plaster; $500, plastered; $100, completed; $500, 35 days.

Beaver near Castro. One-story frame; owner, Sylvester Doan; contractor, W. W. Redhall; cost, $1,977; signed, Oct. 5; filed, Oct. 6; payments, $495, enclosed; $494, brown mortar on; $491, completed; $494, 35 days.

Bryant near Butte. Alterations and additions; owner, Mary Fitzgerald; architect, M. J. Welsh; contractor, Arthur & Lafayette; cost, $1,470; signed, Oct. 7; filed, Oct. 7; payments, $367.50, frame up; $367.50, brown mortar on; $367.50, completed; $367.50, 35 days.

Bush near Broderick. To build; owner, Nicholas Hattna; architect, Harold D. Mitchell; contractor, John Strand; cost, $3,100; signed, Oct. 7; filed, Oct. 15; payments, $900, frame up; $600, house mortar on; $600, standing finish on; $625, completed; $775, 35 days.

Bush near Powell. To build; owner, Mary F. Ryer; architect, W. H. Lillie; contractor, Jos. Kennedy; cost, $18,804; signed, Nov. 2; filed, Nov. 3; payments, $1,503, old building torn down and foundation of new one in; $2,520, frame up; $2,520, enclosed; $2,520, brown mortar on; $2,520, standing finish on, $2,520, completed; $4,701.35 days.

Bush near Powell. Grading; owner, Thos. Madigan; contractors, Belyea & Rogers; cost, $2,100; signed, Sept. 29; filed, Oct. 12; payments, $2,100, completed.

Butte and Minnesota. Two-story flat; owner, Patrick Cronan; architect, W. C. Dickerson; contractor, Miron & Gardner; cost, $3,835; signed, Oct. 10; filed, Oct. 11; payments, $950, framed; $950, roof and brown mortar on; $950, completed; $985, 35 days.

Butte near Mississippi. To build; owner, John Parnell; contractors, Seiter & Stevens; cost, $1,280; signed, Oct. 18; filed, Oct. 20; payments, $320, enclosed; $320, brown mortar on; $320, completed; $320, 35 days.

California and Stockton. Lathing and plastering; owner, J. J. Wyatt; architect, John Gash; contractor, Joseph Morris; cost, $1,200; signed, Oct. 27; filed, Oct. 28; payments, $600, brown mortar on; $100, cornices stuck; $300, one house finished; $150, 2d house finished; $150, completed; $300, 35 days.

Clay and Powell. Three-story frame; owner, Wm. Daegener; architects, Kenitzer & Kollofrath; contractors, Schutt & Kreeker; cost, $12,000; signed, Nov. 1; filed, Nov. 3; payments, $2,500, frame up; $3,000, brown mortar on; $3,000, ready for paint; $500, completed; $3,000, 35 days.

Clay near Powell. Alterations and additions; owner, Gianvito Tocconi; contractor, Luigi Franconi; cost, $2,000; signed, Nov. 2; filed; Nov. 3; payments $675, 1st floor joists and studding set; $375, completed; $375, brown mortar on $375, completed; $360, 35 days.

Clay and Webster. Grading and filling in; owner, Dr. L. C. Lane; architects, Wright & Sanders; contractor, J. G. Conroy; cost, $3,000; signed, Oct. 15; filed, Oct. 18; payments, 1st Saturday of each month 75 per cent. as work progresses; balance, 35 days.

Clayton near Oak. Two-story frame; owner, Ferdinand Frowman; contractors, Soule & Hoadley, cost, $6,000; signed, Oct. 17; filed, Oct. 18; payments, $1,125, frame up; $1,125, enclosed; $1,125, plastered; $1,125, completed; $1,500, 35 days.

Clement near 3rd Ave. Two-story frame; owner, F. T. Newsbury; architects, Colley & Lemme; contractors, Constable & Hamilton; cost, $3,647; signed, Sept. 30; filed, Oct. 3; payments, $945, enclosed; $945, plastered; $945, accepted; $812, 35 days.

Clementina near 3rd. Frame building; owner, R. M. de Larronda; architect, J. Ahlbach; contractor, Henry Munster; cost, $5,000; signed, Oct. 11; filed, Oct. 12; payments, $1,250; enclosed; $1,250, brown mortar on; $1,250, completed.

Columbia near 26th. Painting exterior; owner, Board of Education; architect, C. I. Havens; contractor, Thos. Learned; cost, $190; signed, Oct. 19; filed, Oct. 20; payments, $190, completed.

Davisadero and Golden Gate Ave. Frame building of eight rooms; owner, Andrew J. Ralston; architects, B. McDougall & Son; contractor, Jno. H. McKay; cost, $4,165; signed, Oct. 14; filed, Oct. 15; payments, $500, 1st tier of joists in; $800, enclosed and rough plumbing in; $800, brown mortar on; $1,023.75, plastered and completed; $1,041.25, 35 days.

Dolores near 16th. Two-story frame; owner, L. J. Ruffino; architect, C. I. Devlin; contractor, T. R. Bassett; cost, $3,762; signed, Oct. 20; filed, Oct. 20; payments, $550, frame up; $600, ready for lathing; $800, extra mill work complete; $800, ready for paint; $870, completed; $942.50; 35 days.

Dorland near Church. Two-story frame; owner, J. B. Knudson; contractor, J. L. Binet; cost, $1,090; signed, Oct. 20; filed, Oct. 20; payments, $400, enclosed; $115, completed; $271, 35 days.

Douglass St. One-story cottage; owner, Mary Wall; contractor, Wm. & H. Plaut; cost, $1,160; signed, Oct. 13; filed, Oct. 18; payments, $600, frame up; $500, carpenter work done; $160, receipted bills shown.

Eighteenth near Douglass. Three-story frame; owner, Peter McCarthy; contractor, F. V. Acker; cost, $9,500; signed, Oct. 12; filed, Oct. 12; payments, $1,200, frame up; $1,200, rustic and roof on; $1,200, floors laid and inside studding up; $1,000, brown mortar on; $1,000, plastered; $1,400, completed; $2,500, 35 days.

Eleventh Ave. near Pt. Lobos. Cottage; owner, James Moran; contractor, T. C. Cochrane; cost, $1,080; signed, Oct. 3; filed, Oct. 10; payments, $600, brown mortar on; $310, completed; $270, 35 days.

Fifteenth near Howard. Two-story and flats, frame; owner, Christian H. Werner; architect, Julius E. Krafft; contractors, Schmidt & Gensler; cost, $3,250; signed, Oct. 13; filed, Oct. 15; payments, $800, rustic and roof sheathed; $825, brown mortar on; $800, completed; $825, 35 days.

Fremont and Bryant. Frame stable; owner, Oregon Improvement Co.; contractor, Chas. W. Kinsman; cost, $1,950; signed, Oct. 24; filed, Oct. 27; payments, 75 per cent on completion; balance, 35 days.

Geary and Octavia. Painting, varnishing, etc; owner, R. M. Black; architect, Wm. Curlett; contractor, Geo. W. Cahon; cost, $2,575; signed, Sept. 21; filed, Sept. 30; payments, 1st and 15th day of each month 75 per cent as work progresses; balance, 35 days.

Golden Gate Ave. To build; owner, F. Bartmann; architects, Salfield & Kohlberg; contractor, H. Rohling; cost, $1,300; signed, Oct. 8; filed, Oct. 14; payments, $300, ready for plasterer; $450, completed; $550, 35 days.

Golden Gate Park. Concrete Bridge; owners, Park Commissioners; architect, A. Page Brown; contractor, Gray Bros. Artificial Stone Paving Co.; cost, $7,000; signed, Oct. 8; filed, Oct. 10; payments, 1st day of each month 75 per cent as work progresses; balance, 35 days.

Golden Gate Ave. near Hyde. Painting Humboldt Primary School; owner, Board of Education; architect, C. I. Havens; contractor, Geo. Gotting; cost, $200; signed, Oct. 17; filed, Oct. 19; payments, $200, completed.

Greenwich near Jones. Painting exterior; owner, Board of Education; architect, C. I. Havens; contractor, Thos. Learned; cost, $195; signed, Oct. 19; filed, Oct. 20; payments, $195, completed.

Haight near Schrader. Two-story frame; owner, H. F. Krebo; contractor, Brooklyn Planing Mill Co.; cost, $8,550; signed, Oct. 13; filed, Oct. 13; payments, $710, frame up; $710, roof shingled; $710, brown mortar on; $710, painted and doors hung; $710, accepted.

Hampshire near 22d. Alterations and additions; owner, Caroline Blumanthal contractor, T. F. Mitchell; cost, $1,800; signed, Sept. 28; filed, Sept. 30; payments, $450, house raised and lot graded; $450, brown mortar on; $450, completed; $450, 35 days.

Harrison and Juniper. Three-story frame; owner, Wm. Offerman; architect, Fred. P. Rabin; contractor, Wm. Tegeler; cost, $7,830; signed, Oct. 3; filed, Oct. 4; payments, $1,400, enclosed; $1,400; brown mortar on; $1,400, plastered; $1,072.50, completed; $1,957.50, 35 days.

Howard and 4th. Underpinning and concrete work; owner, Annie N. Farrell; architects, Shea & Shea; contractor, Gray Bros. Art Stone Paving Co.; cost, 30cts. per cubic foot; signed, Oct. 20; filed, Oct. 27; payments, 1st day of each month 75 per cent as work progresses; balance, 35 days.

Hyde and Vallejo. To build; owner, W. K. Bush; architects, Martens & Coffey; contractors, Patterson & Drew; cost, $4,300; signed, Oct. 12; filed, Oct. 22; payments, $1,000, enclosed; $1,000, outside finish and brown mortar on; $1,200, completed; $1,100, 35 days.

Jackson near Lyon. Concrete bulkhead, etc.; owner, Mrs. Annie Meade; architect, J. C. Newsom; contractor, H. Stettin; cost, $1,550; signed, Oct. 13; filed, Oct. 18; payments, 1st and 15th day of each month 75 per cent. as work progresses; balance, 35 days.

Jones near Pine. Three-story frame; owner, E. E. Staples; architect, F. B. Wood; contractor, J. F. Logan; cost, $8,033; signed, Oct. 14; filed, Oct. 14; payments, 75 per cent as work progresses; balance, 35 days.

Jones near Sacramento. Two-story frame; owner, Mary Spillane; architect, F. B. Wood; contractor, John T. Grant; cost, $4,100; signed, Oct. 5; filed, Oct. 6; payments, $1,025, frame up and roof on; $1,025, brown mortar on, sashes hung and glazed; $1,025, completed; $1,025, 35 days.

Karl near Cole. To build; owners, Emma M. & J. L. Callison; cost, $4,000; signed, Oct. 12; filed, Oct. 13; payments, $1,600, frame up; $1,000, enclosed and brown mortar on; $1,400, completed.

La Fayette near Mission. To build; owner, Wm. Hughs; contractor, Jas. McLean; cost, $1,450; signed, Oct. 22; filed, Nov. 3; payments, $400, brick foundations and rear yard porches and steps in; $375, new front on; $675, completed; $400, 35 days.

Lagamore and Plymouth. Two-story frame; owners, Mary Lane and Delia Hall; contractors, Morrison & Cook; cost, $1,425; signed, Oct. 22; filed, Nov. 3; payments, $575, rustic and roof boards on; $350, brown mortar on; $350, completed; $500, 35 days.

Market near Second. Stone fixtures; owner, Palace Hardware Co.; architects, Wood & Lovell; contractors, Anderson Bros.; cost, $1,430; signed, Oct. 10; filed, Oct. 11; payments, $479, ⅓ work complete; $479, completed; $478, 35 days.

Market and Hayes. Store fitting; owner, J. Kemp; architect, Wm. H. Armitage; contractors, Robinson & Gillespie; cost, $2,100; signed, Aug. 8; filed, Nov. 2; payments, material delivered upon ground 75 per cent of value; 25 per cent, 35 days.

Market near Powell. Painting, varnishing, etc.; owner, Annie Donahoe; architect, C. I. Havens; contractors, Fraser & Keefe; cost, $5,895; signed, Oct. 21; filed, Nov. 2; payments, 1st and 15th day of each month 75 per cent as work progresses; balance 35 days.

McAllister near Franklin. Painting exterior; owner, Board of Education; architect, C. I. Havens; contractor, Thos. Learned; cost, $200; signed, Oct. 19; filed, Oct. 20; payments, $200, completed.

McAllister near Van Ness. Carpenter work, painting, etc.; owner, M. E. Ulmer; architects, Stone & Munson; contractor, Geo. Connon; cost, $4,892; signed, Oct. 12; filed, Oct. 13; payments, $917.25, frame up; $917.25, enclosed; $917.25, plastered; $917.25, completed; $1,223, 35 days.

McAllister near Van Ness. Alterations and additions; owner, Fred Haussler; architect, H. Geilfuss; contractor, F. W. Kern; cost, $2,460; signed, Oct. 26; filed, Oct. 28; payments, 1st and 15th day of each month 75 per cent as work progresses; balance, 35 days.

Mission near 16th. Painting exterior; owner, Board of Education; architect, C. I. Havens; contractor, Thos. Learned; signed, Oct. 19; filed, Oct. 20; payments, $190, completed.

Noe near Ridley. Two-story frame; owner, Mrs. J. B. Jardine; contractor, H. R. Schmuckert; cost, $3,235; signed, Oct. 6; filed, Oct. 7; payments, $606, frame up; $606, brown mortar on; $606, plastered; $608, completed; $809, 35 days.

O'Farrell near Hyde. Alterations and additions; owner, Wm. Schnudtz; architect, C. M. Rossman; contractor, Andrew Christensen; cost, $2,400; signed, Oct. 26; filed, Oct. 27; payments, $400, framed; $800, brown coated; $600, completed; $600, 35 days.

Old San Jose Ave. near 29th. Two-stores and flats; owner, Geo. Ruddock; architect, J. F. Kenna; contractors, Peterson & Olson; cost, $5,350; signed, Oct. 10; filed, Oct. 19; payments, $1,337.50, frame up; $1,337.50, brown mortar on; $1,337.50, completed; $1,337.50, 35 days.

Oregon and Drumm. Plumbing, gas-fitting, etc.; owner, Jas. G. Fair; architect, H. A. Schulze; contractor, Jas. E. Britt; cost, $1,785; signed, Oct. 7; filed, Oct. 15; payments, 1st ann 15th day of each month 75 per cent as work progresses; balance, 35 days.

Pacific near Broderick. Lathing and plastering; owner, David Perry; architect, C. I. Havens; contractor, J. R. Tobin; cost, $1,600; signed, Oct. 7; filed, Oct. 10; payments, $800, plastered; $400, completed; $400, 35 days.

Pacific near Central Ave. Two-story frame with basement; owner, E. T. Shepard; architect, J. C. Newsom; contractor, Fred Kromnick; cost, $2,325; signed, Nov. 1; filed, Nov. 1; payments, $881.25, frame up; $881.25, brown mortar on; $881.25, completed; $881.25, 35 days.

Park Road near Park Hill Ave. Laundry machinery; owner, Sister M. Otilea; architects, Shea & Shea; contractor, Troy Laundry Machinery Co.; cost, $1,695; signed, Oct. 19; filed, Oct. 27; payments, $1,271; machine set in position; balance, 35 days.

Pine near Franklin. Sewering, plumbing, etc.; owner, Gustav Sutro; architect, Julius E. Kraft; contractor, Duffey Bros.; cost, $2,065; signed, Oct. 14; filed, Oct. 17; payments, $900, sewer and rough plumbing in; $900, completed; $555, 35 days.

Pine near Franklin. Two-story building with basement and attic; owner, Gustav Sutro; architect, Julius Kraft; contractor, W. W. Ackerson; cost, $15,000; signed, Oct. 13; filed, Oct. 17; payments, $2,500, frame up and sheathed and bulkheads built; $2,500, enclosed and brown mortar on; $2,500, interior finished and plastered; $2,500, interior ready for painting; $2,000, completed; $3,750, 35 days.

Pine near Hyde. Alterations and additions; owner, Peter Jorgensen; architect, W. H. Lillie; contractor, J. C. Rogers; cost, $5,523; signed, Oct. 4; filed, Oct. 4; payments, $1,023, old building repaired and frame of new building up; payments, $1,500, frame of stable up and brown mortar on; $1,000.02, completed; $1,980.97, 35 days.

Point Lobos and 3rd Ave. Frame building; owner, Patrick O'Donnell; contractors, Huber & Osborn; cost, $2,100; signed, Oct. 17; filed, Oct. 24; payments, $600, enclosed; $600, brown mortar on; $600, plastered; $300, completed.

Post near Stockton. Alterations and additions; owner, M. J. Wilson; architect, Clinton Day; contractor, John McCarthy; cost, $1,784; signed, Oct. 25; filed, Oct. 26; payments, $4,500, 2d story beams laid; $5,500, roof tinned; $6,500, brown mortar on; $7,338, completed; $7,346.35 days.

Powell near Bush. Three-story frame; owner, John Scott; contractor, Richard Fahy; cost, $5,450; signed, Oct. 27; filed, Oct. 28; payments, $1,000, enclosed; $1,000, brown mortar on and outside finish done; $1,500, completed; $1,950, 35 days.

Sacramento near Cherry. Onestory frame; owner, Mary Cavanaugh; architect, Wm. H. Armitage; contractor, W. H. Mead; cost, $1,700; signed, Sept. 27; filed, Sept. 30; payments, $425, frame up; $425, brown mortar on; $425, completed; $425, 35 days.

Sacramento, Nos. 1630, 1632, 1634. Alterations and additions; owner, Julien Smith; architect, J. Marquis; contractor, Robert Currie; cost, $5,386; signed, Smith; architect, J. Marquis; contractor, Robert Currie; cost, $5,386; signed, Nov. 1; filed, Nov. 2; payments, $900, new front, except porches, finished; $900, brown mortar on and sewers connected; $900, completed; $886, 35 days.

Sadowa near Plymouth. Cottage; owner, Mrs. May McKenzie; contractor, H. Lehoussse; cost, $1,100; signed, Oct. 5; filed, Oct. 6; payments, $400, roof on; $400, completed; $400, 35 days.

Seventeenth near Church. Alterations and additions; owner, Bernard Trezzini; architect, A. J. Barnett; contractor, A. G. Faber; cost, $1,000; signed, Oct. 1; filed, Oct. 11; payments, $300, roof boards on; $300, brown mortar and outside finish on; $400, completed; $400, 35 days.

Sharon near 16th. Onestory frame; owner, Eugene O'Connor; contractor, Alfred Hawkins; cost, $1,025; signed, Oct. 11; filed, Oct. 15; payments, $607, enclosed; $406, brown mortar on; $405, completed; $767, 35 days.

Shotwell near 23rd. Painting exterior; owner, Board of Education; architect, C. I. Havens; contractor, Thos. Learned; cost, $145; signed, Oct. 19; filed, Oct. 20; payments, $145, completed.

Silver near 2d. Painting exterior; owner, Board of Education; architect, C. I. Havens; contractor, D. Zelinsky; cost, $100; signed, Oct. 18; filed, Oct. 20; payments, $100, completed.

Silver near 2d. Painting exterior; owner, Board of Education; architect, C. I. Havens; contractor, W. S. Upham; cost, $130; signed, Oct. 22; filed, Oct. 24; payments, $130, completed.

Stevenson near 19th. Alterations and additions; owner, Mary Cluney; contractor, A. S. Cook; cost, $1,750; signed, Oct. 20; filed, Oct. 20; payments, $887.50, frame up; $887.50, brown mortar on; $887.50, completed; $887.50, receipted bills shown.

Sutter near Gough. Three additional rooms to school; owner, Board of Education; architect, C. I. Havens; contractor, Jas. Campbell; cost, $2,994; signed, Oct. 31; filed, Nov. 2; payments, $1,000, enclosed and brown mortar on; $1,191, completed; $800, 35 days.

Sutter near Jones. Four-story brick and frame; owner, Emeline Wallace; architect, R. H. White; contractor, D. T. Pierce; cost, $22,556; signed, Oct. 10; filed, Oct. 11; payments, $4,750, foundation in and wall plates on; $4,650, frame up; $3,800, ready for brown mortar, main cornice and bay windows; $3,800, frame up; $5,000, ready for brown mortar, main cornice and bay windows; $3,650, plastered; $3,800, inside finish on; $2,000, completed; $21,000, 35 days.

Sutter near Jones. Alterations and additions; owner, University Club; architect, A. Page Brown; contractor, D. S. Chrisholm; cost, $1,575, signed, Oct. 6; filed, Oct. 7; payments, 1st day of each month 75 per cent as work progresses; balance 35 days.

Sutter near Mason. Grading; owner, Simeon Wonham; architects, Pissis & Moore; contractor, J. H. O'Brien; cost, $3,000; signed, Oct. 1; filed, Oct. 3; payments, 1st and 15th day of each month 75 per cent as work progresses; balance, 35 days.

Sutter and Montgomery. Bank furniture; owner, Donohoe, Kelly Banking Co.; architect, Chas. J. Deeling; contractor, Jos. Kemp; cost, $3,875; signed, Sept. 29; filed, Oct. 1; payments, 75 per cent as work progresses; balance, 35 days.

Sutter and Montgomery. Plumbing work; owners, J. A. & P. J. Donohoe; architect, C. J. Deeling; contractor, $2,000; signed, Oct. 22; filed, Oct. 24; payments, 75 per cent as work progresses; balance, 35 days.

Sutter near Taylor. Fresco work; owner, Golden Gate Building Association; architect, Wm. F. Smith; constructors, Kern & Elbach; cost, $1,600; signed, Oct. 18; filed, Oct. 20; payments, $150, primed and sized; $400, stenciled; $750, completed; $400, 35 days.

Third Ave. near Lake. A dwelling house; owner, Chas. Welsch; contractor, C. A. Petterson; cost, $1,650; signed, Oct. 6; filed, Oct. 7; payments, $400, enclosed; $500, plastered; $650, completed.

Twenty-fourth and Dolores. Concrete wall; owner, Geo. Edwards; contractor, Gray Bros. Art Stone Co.; cost, 50 cts. per cubic foot; signed, Sept. 30; filed, Oct. 5; payments, to be paid in three equal payments on or before the 2, 4 and 6 months from completion.

Union, Fillmore, Green and Steiner. Stone sidewalk; owner, Amelia V. R. Pixley; contractor, George Goodman; cost, $2,440; signed, Sept. 30; filed, Oct. 7; payments, 75 per cent, sidewalk on Union street completed; 75 per cent, Fillmore street completed; 75 per cent Green street completed; 75 per cent Steiner street completed; balance 35 days.

ALAMEDA COUNTY.

Addison St., Berkeley. To build; owner, Edward McVay; architect, G. W. Collignon; contractor, Oscar Carpenter; cost, $1,500; signed, Oct. 6; filed, Oct. 26; payments, 75 per cent as work progresses; balance 35 days.

Alameda Ave. near Walnut, Alameda. Additional work to a building; owner Mrs. Anna Regoudet; contractor, A. R. Benke; cost, $1,700; signed, Oct. 2; filed, Oct. 27; payments, $900, roof on; $800, completed; $800, 35 days.

Block No. 567, Lot 20, Oakland. One-story cottage; owner, Sarah Keetley; contractor, W. M. Campbell; cost, $2,200; signed, Sept. 28; filed, Oct. 1; payments, $675, frames up; $450, enclosed, floors laid and brown mortar on; $450 completed; $575, 35 days.

Butler near Idaho. One story frame; owner, C. A. Klinkner; contractor, G. B. Sommer; cost, $1,735; signed, Oct. 19; filed, Oct. 20; payments, $433, enclosed; $433, brown mortar on; $433, completed; $436, 35 days.

Centreville, Alameda. Two-story frame; owner, Fannie Salz; architects, J. J. & T. D. Newsom; contractor, B. O. Simpson; cost, $3,548; signed, Oct. 11; filed, Oct. 13; payments, 75 per cent as work progresses; 25 per cent, 35 days.

Clay near 13th, Oakland. To build; owner, Oakland Gas Lighting and Heating Co.; architects, Coxhead & Coxhead; contractor, Rhody Ringrose; cost, $7,400; signed, Sept. 21; filed, Oct. 2; payments, 1st day of each month 75 per cent as work progress; balance 35 days.

Dow and Thomas Tract, Brooklyn. Two-story frame; owner, W. F. Thomas; contractor, J. A. Eastman; cost, $1,640; signed, Oct. 5; filed, Oct. 6; payments, $410, frame up and roof sheathed; $410, brickwork finished and brown mortar on; $410, completed; $410, 35 days.

Eighth near Chestnut, Oakland. Two-story frame; owner, Andrew Rudgear; contractors, A. W. Pattiani & Co.; cost, $4,079; signed, Oct. 8; filed, Oct. 10; payments, $1,000; rustic and shingles on and chimneys built; $1,000, window panes in and brown mortar on; $1,000, completed; $1,079, 35 days.

Fifth near Allston, Berkeley. One-story cottage; owner, Wm. Smidt; architect, Wm. Schrof; contractor, Thos. P. Roark; cost, $1,385; signed, Oct. 12; filed, Oct. 14; payments, $345, rustic and roof boards on and chimneys built; $345, brown mortar on, and window frames set; $345, plastered; $350, 35 days.

THE old firm of Kenitzer & Kollofrath, Architects, has dissolved partnership. Mr. C. W. Kenitzer remaining at the old stand, 601 California street, corner of Kearny, while Mr. Edmund Kollofrath has located his office in the Flood Building, room 58.

THE end of another year has come, and marks an important event. When one thinks of what it has been in comparison with what it might have been, the contrast suggests the question: To what extent are we, ourselves, accountable for the aqueous castles and misdirected ideals that have come to nought?

Have we, as individuals, performed our duties in a manner to advance and elevate the profession or trade we call our own? We are often reminded that the past, when reviewed, does not present the rosy tints that attracted our attention at an earlier period, yet tints of evening sometimes show a refined softness not to be found in the dazzling light of the morning.

The year 1892 has added many growths to the industries of this section of the country. The mines have turned out their wealth, the farming and fruit products have been more abundant than in any previous year, and the country districts are prosperous to an unusual extent.

Railroads have been extended into some of the richest valleys, electric roads have come to open up increased facilities for travel, the water courses of our hills have been utilized to run electric plants and the power conveyed to what have heretofore been inaccessible points for manufacturing purposes. The increased use of electricity in architecture and engineering during the year has been beyond computation.

The year has shown a marked expression of opinion regarding the technical education of those who are to take the field in years to come, and among them all, architecture as an art and a science has been passing gradually from the hap-hazard styles of a few years ago, to a more systematic development which is very gratifying to those who love the profession. As the days pass on we naturally turn toward the future and endeavor to unravel the mysteries Father Time has in store for us.

GAS for household use is only just beginning to be appreciated. The manufacturers will come forward with the requisite apparatus as soon as the consumers understand its advantages. At present, somewhere about seventy-five or eighty per cent is lost. It will not be a great while when the one gas flame will be used for lighting, ventilation and disinfection, and the heat turned to account for warming, cooking and many other household conveniences. At one time it was thought that the electric light would displace gas, but the partial development of the gas jet has demonstrated that it can hold its own with electricity. The old objection on account of the smoky flame that begrimmed with soot the walls, ceilings, hangings, etc., does not hold good at this time, because of the great improvement in the gas itself and in the appliances by means of which it is used. Gas is plunging ahead with an inertia almost irresistible, and electricity has started with lightning speed which will slacken when it becomes more loaded with practical problems, and then will come the great contest of light with reference to practical utility.—

THE importance of a recognized system for electrical wiring of buildings is worthy of the closest attention of the architectural profession. The Architect and the Electrician should meet and formulate some general plan which will permit the wires to be run in a manner that will not interfere with the style of furnishing, and yet have them accessible for repairs, etc., when desired.

The feasibility of electric lighting depends in a measure on the judicious treatment of the wiring, having due regard for the safety and economy in its application.

THE present indications regarding the future development of Mexico point towards an advance of such proportions as to disparage all previous examples of the growth of other countries.

Only a very small fraction of the resources of Mexico has been brought into notice. Some of the richest mines known are awaiting a time when power can be utilized to advantage in localities that have been considered inaccessible.

Fertile lands in abundance are ready for settlement: large tracts of valuable timber for building purposes, also rare and costly ornamental woods, suitable for furniture and decorative uses, and dyewoods of various kinds are plentiful.

The soil is well adapted to the growth of fibre plants, a product that is receiving the attention of manufacturers of paper, etc.

All countries heretofore have been gradually developed through several centuries: Mexico, on the contrary, has lain asleep during the three hundred and fifty years since its first settlement, but when it does take a start it will have no precedence to look to for guidance. Railroads by steam or electricity will take the place of the typical "mule trail," the forests will be cut and worked by the aid of modern appliances, the soil tilled and crops gathered and marketed by machinery, the mines that could only be worked by hand power, under great disadvantages, will be worked by steam or water power. Such power can be carried over peak and ravine by means of wires and then applied at the surface or deep into the mine itself for drilling, hoisting, crushing, separating and all other purposes for which power is required.

With all these advantages the future prospects of Mexico are exceedingly bright.

THE PROPOSED NEW FRENCH HOSPITAL.

"HOTEL DE SANTE."

THE French Mutual Benevolent Society is about to build the finest hospital in the city. The circular containing the description of the location, the needs of the Society and the terms of the competition was issued last May. The prizes were awarded in November.

The design "Hygiene" received the first prize and was prepared by William Mooser of this city and J. Morin Goustiaux of Paris, France, as associated architects. The committee, however, made several slight objections to the plan, the greater portion of which had been already anticipated by Mr. Mooser. The materials will consist of brick, concrete and artificial stone.

The administration building will front on Point Lobos avenue. There will be fourteen detached buildings, and they will have connections with each other only by means of galleries. Of the fourteen buildings five of them will be of two stories, the remainder one story.

The administration building will be set back somewhat from the line of the sidewalk, in order to allow the cultivation of a garden and room for avenues and walks. On the line of the sidewalk will be a fine bronze fence.

The first floor of the administration building will be devoted to the authorities in the hospital. In it will be the superintendent's office, the clerk's office, the reception-rooms and parlors, the drugstore, the laboratory and consulting-room, and in the rear portion the library.

On the second floor will be the quarters of the visiting and resident physicians and the apartments of the druggist and other officials of the institution.

On each corner of the Point Lobos side there will be two buildings constructed, abutting the side towers of the administration building. They will rise from the very line of the sidewalk, the bronze fence running to their corners. One of these will be the stable of the hospital, and the other will be occupied as quarters for the employes.

The hospital proper, which consists of a series of wards is constructed about twenty feet from the sidewalk and reaches around the entire block. These wards, or pavilions, will all be detached from each other as far as structure is concerned, but some of them will be connected by galleries. They are so arranged as to all obtain the greatest amount of sunshine.

The wards will be of similar design in the following order: First ward for paying patients; second ward, male medical cases; third ward, surgical patients; fourth ward, female complaints; fifth ward, female medical cases; sixth ward, chronic cases; seventh ward, tubercular cases; eighth ward, contagious cases; ninth ward, operating-room.

On the south side will be situated the bath department, which will be a very elaborate affair, and will have no superior in any hospital in the country. It will contain departments for medicated bathing, massage, Russian and Turkish baths, and also the plunge and steam rooms.

Beyond the bathhouse will be the disinfecting department, the morgue, the power house and laundry.

The design "Egalite Fraternite," prepared and submitted by E. Depierre of this city, received the second prize.

The distinctive features of each plan and which appears to have, in a great measure, governed the actions of the committee was the location of the gardens. In the first plan the garden will be placed within the quadrangle as enclosed by

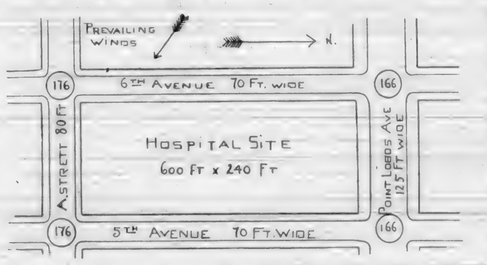
the buildings which encircle the grounds. This arrangement will temper the ocean winds and give fresh air and sunshine.

In the second design the different buildings have been arranged more in a cluster toward the ocean side leaving the gardens at the outer portions of the grounds.

The building committee of the society which had charge of the selection of plans for the new hospital, is as follows:—Henry S. Martin, President; E. Raas, Vice-President; Dr. G. Gross, Secretary; Dr. D. Tait, Secretary; Dr. F. Bazan, Dr. K. Pischl, E. Robinet, O. Bozio, J. St. Denis, M. Hainque, B. Sarthou, V. Marchebout, D. Levy, A. Lagallet, Raoul Chartrey.

THE circular issued to the competing architects was as follows:—

"The French Benevolent Society has decided at a general meeting to open a competition among architects for the designs of a New Hospital which is to be erected in the City and County of San Francisco, on a lot of ground bounded by Point Lobos, 5th and 6th avenues, and by A street.



The lot is a rectangle 600 feet long by 240 feet wide. The levels above base are indicated at each street intersection. The base line is 6 ft. 7 above high tide. The direction of the prevailing winds and the points of the compass are shown in figure. There is a large sewer running along Point Lobos avenue.

The pavilion system shall be adopted for the New Hospital. The pavilions to be mostly of two stories and basement. The different buildings to be connected by corridors. There shall also be the necessary covered galleries.

Walls to be of brick, foundations of concrete, the entire areas of the different buildings at basements to be covered with artificial stone or asphaltum.

The main entrance to be either on Point Lobos avenue or on 5th avenue.

The plumbing to be the best, and special attention must be given to the disposal of the sewerage.

The buildings to be heated with hot water and so disposed as to make the ventilation thorough.

All portions of the buildings to be arranged for gas and electric light.

The Hospital shall be built for 150 patients, distributed as follows:

25 beds for patients suffering from chronic diseases, called "Invalides";

25 beds for paying patients, occupying 20 separate rooms and 5 double rooms;

100 beds distributed in wards, 75 for male patients and 25 for female.

The 75 males to be divided in 4 categories:

1°. 40 cases for medical treatment;
2°. 20 cases for surgical treatment;
3°. 12 cases of tuberculosis;
4°. 6 cases of contagious diseases.

The cases of medicine and surgery to be divided in 2 wards of 20 beds each, and the cases of surgery in 2 wards of 10 beds each.

The female patients, 25 in number, will be divided as follows:

15 cases of medicine, 5 cases of surgery, 3 cases of tuberculosis, 2 cases of contagious diseases.

To resume, the New Hospital shall contain for the accommodation of the patients:

Six Common Wards.—Male: 2 medical wards and 2 surgical wards. Female: 1 medical ward and 1 surgical ward.

1 pavilion for contagious diseases.
1 " " tuberculosis.
1 " " the "Invalides."

Each pavilion shall contain as annexes, separate rooms to isolate patients or for nurses.

The water closets, wash basins, baths, sinks, whenever practicable, shall be placed outside of the pavilions.

Operating Rooms.—There shall be a main operating room of 350 sq. feet, with hat and coat room, store room and etherizing room.

A small operating room 180 sq. ft.

A general Dining Room to accommodate 40 patients.

The service of the administration, the general service accessories, shall comprise:—The pavilion of the administration, the kitchen and annexes, the baths, the engine room, laundry, wells, reservoirs, the morgue, the disinfecting department, a stable, a covered shed and a gate lodge.

The employes numbering 36, to be accommodated as follows:—14 in separate rooms, and the balance in dormitories containing each from 4 to 5 beds.

The following is a list of the employes:—1 superintendent, 2 internes, 2 druggists, 1 head nurse (male), 6 male nurses, 5 female nurses, 1 porter, 1 lingere, 2 cooks, 3 assistants, 2 engineers, 2 laundry men, 1 gardener, 1 messenger, 1 guide, 4 workmen, 1 bather.

The pavilion of the administration shall contain in the first story:

1°. The superintendent's office, bed room, sitting room.
2°. The pharmacy and laboratory 400 square feet, in the basement occupying the same surface shall be the store room for drugs.
3°. Two waiting rooms, 150 square feet each, two consulting rooms with laboratory in alcove with special ventilation.
4°. Dark room for eye examination.
5°. Parlor and library adjoining. 500 square feet.
6°. Dining room for officers, for 12 persons.

Above shall be the lodgings for physicians, druggists, etc.

Two bath rooms and water closets.

The kitchen building shall contain:

The kitchen, 600 square feet.—The pantry, 120 square feet.—A dining room for 30 employes.—The store room for vegetables, 100 square feet.—The store room for groceries, 200 square feet.—The wine cellar, 400 square feet.—Lodgings for the cooks and assistants.

The bath house shall contain 4 ordinary bath rooms, 4 sulphur baths, 1 medicated bath, 1 fumigating room, hot air and steam rooms, small rooms with couches, a massage room, 1 shower room.

The Engine House and Laundry.—The engine room to contain two boilers, 16 feet long, 40 horse power each, engines for pumps for laundry, dynamos, etc., a machine shop. The laundry to cover 800 sq. ft., the drying room 400 sq. ft., the ironing department to occupy 3 rooms. There shall be 2 wells and 2 reservoirs, each of 30,000 gallons.

The Morgue and its Laboratory shall cover 320 sq. ft. and shall contain 1 autopsy table, 4 slabs; adjoining or in close proximity shall be the service of disinfection which shall consist of 2 rooms.

The Porters Lodge, near the entrance, shall consist of two small rooms.

A stable for two horses and two vehicles.

A small shed near entrance for horses and carriages.

A water closet for each sex shall be placed in yards.

The total cost of buildings, grading and enclosures not to exceed $180,000.

The competing Architects shall furnish:

The plan of basement or foundation;

The plans of first and second stories at the scale of one-sixteenth of an inch per foot;

Two elevations and two sections at the scale of one-eighth of an inch per foot, the sections and elevations to be lined only, without shading;

A description of the construction, especially the manner in which the different parts of the works are to be executed;

The materials to be employed and the sizes thereof, the system of ventilation, of heating, the plumbing and all information necessary to give a thorough and clear idea of the designs.

In addition to the foregoing, the competing architects shall be at liberty to send any additional drawings which they deem necessary for the full explanation of their ideas.

All designs to be designated by a motto with the name of the authors, in sealed envelopes.

They shall be submitted on or before the first day of October, 1892, before 5 P. M., at the office of the Society, 610 Jackson street, San Francisco.

Two prizes will be awarded to the committee of fifteen, to whom the Society has conferred full powers.

The author of the design classed first shall receive $600. The second prize shall be of $400.

The plans receiving premiums shall become the property of the Society.

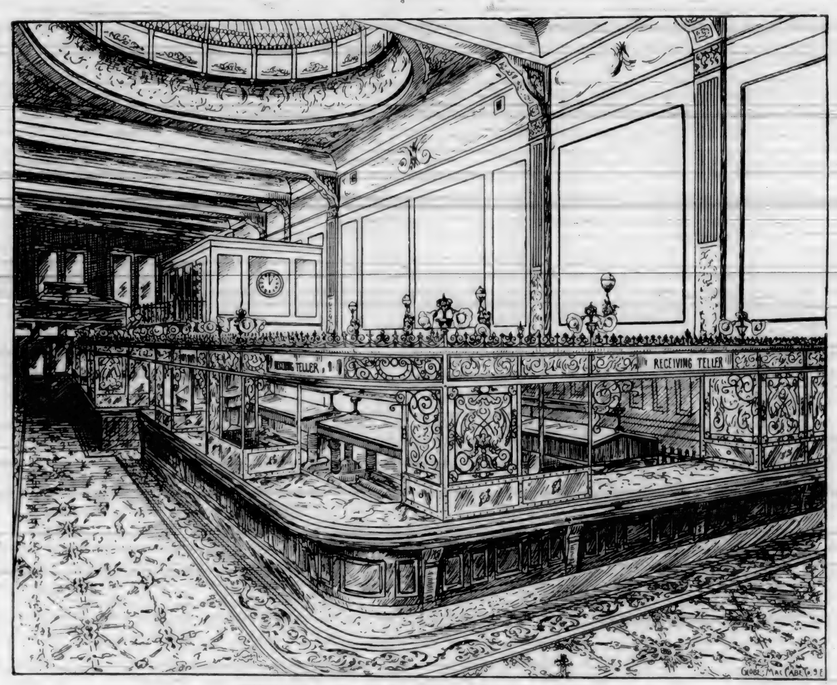
The Committee reserves the privilege of rejecting any or all designs or plans submitted.

H. S. MARTIN,
President of Committee.
DR. DUDLEY TAIT,
Secretary of Committee.

THE GERMAN BANK.

THE new Bank Building for the German Savings and Loan Society has been recently finished and opened for business. The building is constructed of brick, stone, iron and steel, with terra-cotta lining, the interior finishing only being of wood. The exterior is of gray granite with red granite introduced at doorways and arches. The vestibule is of variegated marble.

The main banking room is 36x120 feet and 32 feet in height. Outside the counters the floor is of Mosaic work, while behind the counters the floor is of white mahogany. The room is lighted by a central dome 32 feet in diameter.



INTERIOR OF THE NEW GERMAN BANK.

Great care has been taken to have the lighting, heating and ventilating as perfect as possible. The design was by Messrs. Kenitzer & Kollofrath, architects.

We are indebted to the *German Democrat* for the engraving showing the interior of the banking room.

An illustration of this building appeared in the CALIFORNIA ARCHITECT of June 1891.

THE local health boards of many of the cities and towns throughout England are making arrangements for the erection of permanent isolation hospitals for the isolation of patients suffering from infectious diseases.

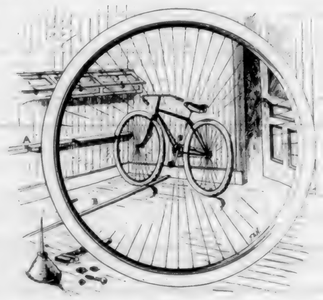
STABLING FOR THE "NICKEL PLATED STEED."

BY FRANK S. HOLLAND.

WHILE proper and safe storage of the bicycle during working hours is a very important feature that is being neglected in the planning of office building, stores, restaurants, etc. The neglect is sorely felt by those wheelmen, who employ the bicycle for business and other purposes. Aside from its intrinsic value, the remarkable and ingenious improvements, that have been made on the cycle within recent years, have been a means of pushing it into more general use among the business community. The lightness, yet rigidity of its construction, the introduction of hardened steel balls in the bearings, the spring frame, and the inflated or pneumatic tie elevate it to a level that is well nigh perfection, and combine to give it its wonderfully increasing popularity.

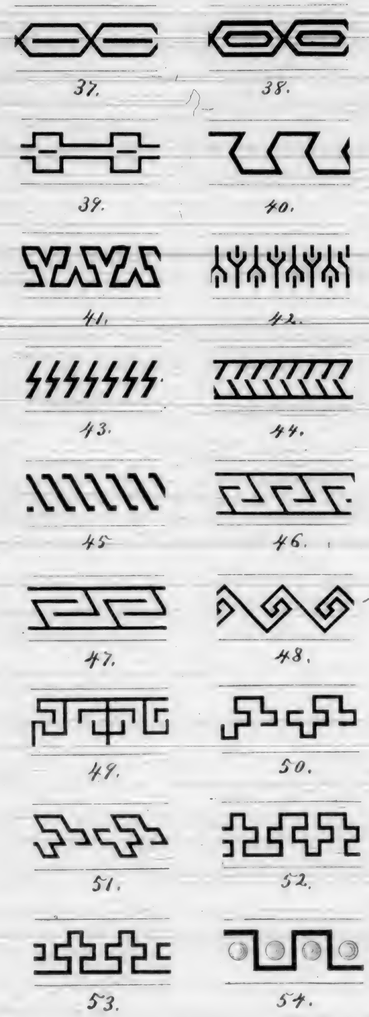
There is now scarcely a business building even of limited tenantry, in which there are not two or more occupants who use the bicycle. These wheelmen have to raise their machines from two to six stories in the elevator, and leave them in the corridors during the day. It is a source of much annoyance to elevator passengers to have a bicycle piloted among them, and to be obliged to climb over the machine when alighting. In many buildings of early construction their is either no elevator, or it is in such a delapidated condition that a breakage is a common occurance. In this case it remains either to carry the wheel up stairs or to leave it in the vestibule. Even though the wheels be locked together, the tool pouch or other attachments remain at the disposal of pilferers. Furthermore, if the weather change, and the rain prevent the cyclist from riding home, it would be necessary to leave the machine unguarded in the corridor or vestibule all night.

There is no need of the present neglect, when the accommodation needed is so easily provided. The room or closet could be off the vestibule, in the basement, or, in some cases, under the stairs. The average machine measures about six feet in length, and about two feet across the handle bar, so that the required space for a given number of bicycles can be readily calculated.



A rack *A* (as illustrated in the figure) could be secured to the wall so as to hold the machine in an upright position, provisions for a sliding bolt, chain or hasp for locking the machine could be made, and a wedge shaped strip, *B*, screwed to the floor to prevent the wheel from moving backward. A locker would also be an excellent provision, in which to keep oil, tools, and other implements or attachments. Although very simple, these interior fixtures would answer all practical purposes.

Is it not obvious, even to persons unfamiliar with the exercise, that cycling is a most beneficial and useful means of locomotion? It strengthens the organs of the abdomen, hardens the muscles, and by promoting respiration, strengthens the lungs, and suffuses the face with a healthful glow. In other words, it is one of the most healthful exercises. Is not, then, the use of the cycle of sufficient importance to be remembered; and is it not worthy of the greatest encouragement?



FRETS.

FRETS showing examples from 1 to 36 were printed in the October and November issues.

STAIR TABLE.

HEREWITH we give a table of rise and run for stairs set in a convenient form for the use of architects, draughtsmen and builders. The spacing of the lines of figures into groups aids the eye in following the direction to the final point.

DIRECTIONS.—In the column beginning with the rise of step desired, find the height of story from top of floor to top of floor, then follow this line to the column under "Risers," which gives the number of risers. In the column under "Treads" find the number of risers LESS ONE, and on this line under the column of width of tread will be the length of run.

ISOLATED ROOM AS A HOSPITAL.

EVERY community is visited at intervals by epidemics therefore an important question for every householder to consider is, "What shall I do with the members of my family who are stricken with disease, so that the surrounding conditions shall be as favorable as the present knowledge of the subject will permit?"

It has been suggested that, for private residences, boarding and lodging houses, hotels, etc., a room could be planned and arranged especially for the purpose and fitted up with the necessary conveniences.

Such room or apartment should be isolated as far as possible from the other portions of the house, and favorably situated for the admission of light and a free circulation of air. The room could be separated from the other rooms by means of a ventilated lobby or corridor between it and the main hall.

Particular attention should be paid to the heating and ventilation. The outlet air shaft should be supplied with gas burners to facilitate the draft and at the same time the flames utilized for burning and destroying the germs of infection before they reach the surrounding atmosphere. The desirability of such a room will be admitted by all persons who have thought upon the subject.

For houses for the wealthy or well to do class of persons, the extra cost would be a slight objection, but where expense must be economized so far that the rooms provided for in the general arrangement must be for daily use, a modification may be made that will, with a very small additional outlay, provide a better arrangement than the present state of the sick room. A chamber suitably situated for light and air could have the floor, doors, sashes and trimmings of hardwood, the walls made smooth, and all the wood or plaster work rendered impervious to moisture.

Under the present conditions the sick room is the usual bed chamber, and is furnished in the modern style, having the walls papered and hung with pictures, the floor carpeted, the furniture upholstered, and the shelves and brackets overcharged with bric-a-brac. When sickness comes to any member of the family, the sick-room should be cleared of all moveable objects and thoroughly cleaned, and then furnished with a cot and bedding, and rugs that can be taken up and shaken, placed on the floor. When the sickness has passed, the room should be disinfected and cleaned, after which it could be again used as one of the apartments of the house.

We believe it is generally accepted that the influence of the mind upon the body may be used as a powerful agent in curing or removing diseases. Therefore, the decoration of the apartment should be of a quieting nature to bring about unconsciously a favorable state of mind and thus indirectly hasten recovery.

Proposed Plan of FRENCH HOSPITAL for CONSUMPTION and HYGIENE. San Francisco, Cal.

BRITTON & REY, PHOTO LITH.

PUBLISHED BY THE CALIFORNIA ARCHITECTURAL PUBLISHING CO. SAN FRANCISCO, CAL.

ROYAL INSTITUTE OF BRITISH ARCHITECTS MDCCCXVIII

ILLUSTRATIONS

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

WE present this month the first and second prize designs for the "Hotel De Sante," the proposed new Hospital for the French Mutual Benevolent Society of this city.

THE selected design "Hygiene" was that submitted by Mr. William Mooser of this city and J. Morin Goustiaux of Paris, France, as associated architects.

THE second prize design "Egalite Fraternite" by E. Depierre, architect, of this city.

Notes & Comments.

IT appears that the World's Fair Commissioners have adopted a rule providing for the closing of the fair grounds during the evenings. If the fair is intended for the exhibition of mechanical devices only, then the daytime would answer for those having leisure time, but how will it serve the purpose of instruction to the thousands, who have only the evenings at their disposal?

The greater part of art workmanship of all kinds is designed and worked for both natural and artifical light. Electric and gas illumination would lose their best effects in daylight.

There is yet sufficient time to undo a part of the damage already done, provided the people will bestir themselves and enter a protest against the action of the Commissioners.

Colonel Lyman Bridges has made a complete topographical survey of the new Post Office site, corner of Seventh and Mission streets in this city. He has also made reports upon the water, gas and sewerage of the site, and upon the building materials. Samples of granite, marble, sandstone, brick, etc., that may be obtained on this Coast, have been forwarded to the officials in Washington.

NOTICE TO ARCHITECTS.

THE following notice to architects carries its own moral. Whether any architects, or as the judge says, "alleged architects" will consider it their "inestimable privilege" to submit plans or not, remains to be seen later. The small bud of a cornice just about sprouting from that white, bald faced Court House in the same city shows what such parsimony may produce under certain conditions. *If* in the future this entablature should grow to its proper proportions, *then* it may be possible for the committee to obtain a suitable design under the conditions set forth.

"1. Plans, with full specifications and estimates, will be received up to 2 o'clock P. M, of JANUARY 3, 1893, by the Executive Board of the Hazelton Library Bequest and the Board of Trustees of Stockton Free Public Library, for a Library building to be erected on portions of lots 2 and 4, in block 12, east of Center street, in the city of Stockton, State of California. The dimensions of said lots are 101 feet on Hunter street and 81 feet on Market street.

2. A fire-proof building is preferred. No plans and specifications will be considered that will cost in excess of $50,000. Perspective to be in natural tints.

3. Three premiums will be given, to-wit:—$500 for the best plan and specifications; $300 for the second best plan and specifications, and $200 for the third best plan and specifications, it being understood that the plan and specifications accepted shall be the property of the Executive Board of the Hazelton Library Bequest and the Board of Trustees of Stockton Free Public Library, to be used in any manner they may desire, and the acceptance of the premium by the architect shall be the purchase price for the same. Every competing architect must present with his plans, specifications and estimates a bond in the sum of $5,000, conditioned that the proposed building can be built for the estimate made, and that if his plan is accepted and the Board determine to build in accordance therewith, he will enter into a bond satisfactory in form and amount to the Board, conditioned that if required he will build said building for his estimated cost. Form of bond must be procured from the Secretary of the Board. The plan and specifications adopted are to be approved by a joint meeting of the Board and the City Council of the City of Stockton, State of California, before any premium is paid.

4. The drawings of floor plans and elevations are to be of four feet to the inch. In the perspective the architect to use his discretion.

The board reserves the right to reject any and all plans, specifications and estimates, or either.

By order of Executive Board of Hazelton Library Bequest and the Board of Trustees of Stockton Free Library.

W. F. CLOWDSLEY, Secretary."

As may be noted in our advertising columns a munificent offer is made to architects by the County Clerk of St. Clair County, Ill. It seems they want plans for an addition to their County Court House, and think these "architect fellows," who have little to do except to hang their heels on the table and smoke cigarettes, will be glad to do most anything to while away their time. So they send out the following competition, after reciting what they want and that the cost is not to exceed $30,000: "Upon adoption of a submitted plan or sketch, the designer of such plan or sketch shall make complete plans and specifications, for which the County of St. Clair, Ill., will pay the sum of $200."—*Architecture and Building News, New York and Chicago.*

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.

GEO. H. SANDERS, Pres. W. J. CUTHBERTSON, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Tres.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.

JOHN RICHARDS, Pres. L. WAGONER, Vice-Pres.
OTTO VON GELDERN, Sec. GEO. F. SCHILD, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.

GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
W. L. CROSETT, Sec. O. BROOKS, Treas.

THE regular meeting of the San Francisco Chapter of the American Institute of Architects, was held the 9th inst, at their rooms, 408 California street. The reports of the officers made a favorable showing.

The following officers were elected:—President, Geo. H. Sanders; Vice-President, W. J. Cuthbertson; Secretary, Oliver Everett; Treasurer, John M. Curtis; Trustees—Geo. W. Percy, Seth Babson, W. J. Cuthbertson, H. T. Bestor, Oliver Everett.

LIPPINCOTT'S for December has a number of interesting articles.

THE FORTNIGHTLY REVIEW for November, contains a chapter on "A Future School of English Art" by the Duke of Marlborough.

THE ELECTRICAL REVIEW is an illustrated, weekly Journal of Scientific and Electrical Progress, published at 13 Park Row, N. Y.

THE ELECTRICAL AGE is an illustrated weekly Electrical Journal, published by the Electrical Age Publishing Co., World Building, N. Y.

THE CINCINNATI LANCET CLINIC is a weekly Journal of Medicine and Surgery, published by Henry C. Culbertson, 199 W. 7th street, Cinn., Ohio.

THE CHURCHMAN is an illustrated weekly Magazine, devoted to news of a religious kind. It has lately been increased in size, and the Thanksgiving number is worthy of the highest praise. Published by M. H. Mallory & Co., 47 Lafayette Place, N. Y.

THE MEXICAN FINANCIER includes the trade and manufacturing interests of Mexico. It is a weekly Journal printed in the Mexican and English languages. Published by Seeger & Guernsey, 7 Bowling Green, N. Y., also in Mexico and London. The paper is of especial value to those having business with our neighbors on the South.

ART OF MITRING. How to Join Mouldings; or, The Arts of Mitring and Coping. A complete treatise on the proper modern methods to apply practically in joining mouldings. A book for working carpenters, joiners, cabinet-makers, picture frame makers and wood-workers. Clearly and simply explained by over 40 engravings, with full directive text. By Owen B. Maginnis, author of "Practical Centring," "The Carpenter's Handbook," (London,) etc. Published by William T. Comstock, 23 Warren street, New York.

This book is attractively bound in cloth, of pocket size 5x7 inches, 75 pages, price $100. It is a very useful work for carpenters, millmen, and all persons who work mouldings which intersect at various angles, or circles of different radii. There has been a pressing need for a work of this kind. The illustrations show the different cuts so clearly that they may be understood by anyone.

THE STANDARD ELECTRICAL DICTIONARY. A popular dictionary of words and terms used in the practice of electric engineering. By T. O'Conor Sloane, A. M., E. M., Ph. D., author of "Arithmetic of Electricity," "Electricity Simplified," "Electric Toy Making." Published by Norman W. Henley & Co., 150 Nassau street, New York.

This is one of the most generally useful works that has been published. It gives the definition of electrical terms which are in many cases illustrated. We do not see how anyone dealing in any manner with modern appliances can do without it.

The work is 5x7 inches, 625 pages. For sale by Osborn & Alexander, 401 Market street, San Francisco. Price $3.00.

Messrs. H. V. & H. W. Poor, publishers of the well-known work, "POOR'S MANUAL OF THE RAILROADS OF THE UNITED STATES," announce that the edition of their "POOR'S HANDBOOK OF INVESTMENT SECURITIES," for 1892–93, will be ready shortly before the close of the year. The department of State, Municipal and County Indebtedness covered, in the last number of the "HAND BOOK," 125 pages. This year it will cover about 325 pages. As may be inferred from this, the information presented in this department has been vastly elaborated; and, to further increase the value of that information to subscribers, maps of each State and Territory have been added.

In all other departments of the book there has been an increase in size and comprehensiveness proportionate to their importance.

ANNUAL BUILDING SUMMARY.

In the following table we present the number and value of buildings erected in San Francisco during the year about to close.

FOR FIRST SIX MONTHS.—1892.

	Brick Building			Frame Building			Alterations & Addit'ns			Total Value.
	No. of Buildings	No. of Contracts	Value.	No. of Buildings	No. of Contracts	Value.	No. of Buildings	No. of Contracts	Value.	
Jan'ry	1	14	$ 101,872	22	33	$ 210,665	4	4	$ 7,872	$ 320,409
Feb'ry	3	8	116,310	28	50	279,149	7	8	24,818	420,277
March	2	8	72,471	30	38	175,071	5	7	14,494	262,036
April	4	23	335,359	46	63	240,772	5	6	20,850	596,981
May	3	17	137,715	46	62	271,200	4	5	21,475	430,390
June	3	9	139,022	39	54	222,110	13	13	51,291	412,423
Total	16	78	$ 902,749	211	290	$1,398,967	38	43	$140,780	265 411 $2,442,496

FOR SECOND SIX MONTHS.—1892.

	Brick Building			Frame Building			Alterations & Additions			Total Value
	No. of Buildings	No. of Contracts	Value.	No. of Buildings	No. of Contracts	Value.	No. of Buildings	No. of Contracts	Value.	
July	8	19	$ 276,427	55	60	$ 267,578	14	14	$ 76,556	77 93 $ 620,561
Aug	3	15	83,263	45	54	280,138	11	11	43,292	59 80 406,693
Sept	4	12	42,303	75	90	476,418	14	14	141,082	93 116 659,803
Oct	1	2	7,350	45	65	270,949	14	14	38,802	62 81 317,601
Nov	1	4	16,790	40	58	232,476	15	16	68,194	56 78 317,460
Dec.	4	8	92,217	41	47	188,822	6	6	10,688	51 61 291,727
Total	21	60	$ 518,350	301	374	$1,716,381	73	75	$379,144	398 509 $2,613,845
G'dTotal	37	138	$1,421,099	515	664	$3,115,348	111	118	$519,894	663 920 $5,056,341

It will be noticed that while the total number of buildings has been decreased by 144, and the number of contracts decreased by 247, the total cost of the buildings erected has been decreased by $1,189,715, from last year.

This statement has been made up from the contracts filed with the Recorder and we should bear in mind that in addition to this, there must have been many improvements not noted through the records. We should estimate such improvements at not less than $800,000 in the whole city, making a grand total of say, $5,856,341 for the year, which is less than in any year since 1883.

We give the total values and numbers from 1880 so that our readers may make a comparison:

1880—	397	engagements,	value	$1,754,435
1881—	533	"	"	3,790,732
1882—	785	"	"	3,896,212
1883—	803	"	"	5,261,689
1884—	1,127	"	"	6,202,807
1885—	1,457	"	"	7,043,999
1886—	1,148	"	"	6,401,669
1887—	1,093	"	"	6,605,054
1888—	891	"	"	6,244,220
1889—	1,081	"	"	7,500,000
1890—	1,037	"	"	7,095,013
1891—	1,162	"	"	6,946,056
1892—	920	"	"	5,856,341

HEALTH REPORT OF OAKLAND, CALIFORNIA.

THE Oakland Board of Health at a recent session, discussed the necessity for the erection of a hospital for patients who may be afflicted with contagious diseases. Health Officer Dunn submitted his report for November as follows:

"The total number of deaths for November is 50 and the annual death rate per each 1000 of the population is 10. This is the lowest monthly death rate during the year and the lowest for November since 1881, (the lowering of the death rate for the month of November is undoubtedly due to the improved sanitary condition resulting from the recent sanitary inspection of the city). A careful examination of the meteorological conditions for the month of November for several years fails to show any explanation therein of the reduced mortality last month.

"The average rate of mortality for November during the past ten years—from 1882 to 1892 is 13.5 and this as against the rate for last month—10 per 1000—shows an actual life saving by improved sanitation during the past month of 1¾ persons per thousand; and if now the Board of Public Works will dredge Lake Merritt so that the main lake sewer may be kept clean by proper flushing, and also prevent the deposit of sewage into the lake from Peralta heights and Vernon heights and from the Fabiola hospital and other habitations near the northern city limits and will further provide a garbage crematory and additionally construct the proposed intercepting sewer, I have no doubt that we would be able to show from vital statistics a clear saving to this community from such improvements of several more human lives each month.

"It has been repeatedly shown in other places and also in Oakland (ten years ago as well as now) as plainly as any fact can be shown by figures that improved sewerage and other sanitary reforms will materially reduce the mortality, or in other words lead directly to the saving of human lives.

"From a study of the vital statistics of this city, I think it is safe to say that if the needed sanitary reforms I have alluded to were made that there would be an immediate fall in the annual death rate of at least three persons per 1000 of the population. This would represent an annual saving of thirty-six persons, and this would restore Oakland to its former high estate of being the healthiest city in the world—an enviable renown—and insure to our individual citizens not only prosperity, but an extraordinary span of life.—*Oakland Enquirer, Dec. 16, 1892.*

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

NOTICE OF LIEN IN MICHIGAN.—The mechanic's lien law held not to imperatively require the lien statement filed to set forth the name of the owner of the property "at the time of making said statement," it being sufficient that the ownership at the time of the making of the contract and the furnishing of the material is set forth. 60.

DAMAGES FOR DELAY ON FURNISHING PILES.—In an action by the owner of a pipe driver, for damages because of delay in furnishing piles, the measure of damages is the actual profits the owner of the pile driver was prevented, by the acts complained of, from earning elsewhere, and evidence of the per diem value of the machine is inadmissable.

Boston v. Henderson, Supreme Court of Mich. 52 N. W. Rep. 1020, 58.

THE RIGHT OF FOLLOWING MISAPPLIED MONEY OR PROPERTY.—Formerly, the equitable right of following misapplied money or other property into the hands of the parties receiving it depended upon the ability of identifying it, the equity attaching only to the very property misapplied. This right was then first extended to the proceeds of the property, namely, to that which was procured in place of it by exchange, purchase, or sale; but if it became confused with other property of the same kind, so as not to be distinguishable, without any fault on the part of the possessor, the equity was lost. Finally, however, it has come to be held as the better doctrine that confusion does not destroy the equity entirely, but converts it into a charge upon the entire mass, giving to the party injured by the unlawful diversion a priority of right over the other creditors of the possessor.

San Diego County v. California Nat. Bank, U. S. Circuit Court 53 Fed. Rep. 59, 151.

LIABILITY OF OWNER FOR CONTRACTORS BILLS.—A late owner contracted with a builder for the construction of a house, and the builder obtained the lumber from a dealer therein. The owner in conversation with the lumber dealer, said he was dissatisfied with the builder's work, and thought he would finish the house himself. On being asked what would become of the lumber account he replied that he would pay it. The dealer continued to furnish the builder materials, and charged them to him, and repeatedly urged him for payment. No bill was ever presented to the owner, and no intimation given him that the dealer relied on him for payment, there was no new consideration for the owner's promise, and, not being in writing, it was void.

Green v. Latcham, Court of Appeals of Colorado, 31 Pac. Rep. 233, 136.

RIGHT OF SUBCONTRACTOR TO LIEN.—The right of a subcontractor to file a lien on a building is not affected by a default on the part of the principal contractor in failing to keep his agreement with the owner, nor by an agreement between the owner and principal contractor subsequent to the one under which he (the subcontractor) began work, and of which he had no notice, wherein the principal contractor undertook to deliver the building to the owner free of all liens.

Cook v. Williams, Supreme Court of Penn., 24 At. Rep. 746, 85.

NOTICES NEED ONLY BE IN ENGLISH.—The laws of this country and the proceedings of the courts are required to be in the English language. So where a notice has to be given, as that a place is unsafe, it is sufficient that a proper notice in English be put up. No further duty in this respect is owed to persons who cannot read English, or cannot read at all.

Weirs v. Jones County, Supreme Court of Iowa, 53 N. W. Rep. 312, 70.

CANCELLATION OF WRITTEN CONTRACT FOR MISTAKE.—While a court of equity will not reform a written contract upon the ground of mistake, unless the mistake is shown to be common to both parties, yet it may exercise its powers to grant relief in a proper case, by rescinding and cancelling the writing upon the ground of a mistake of facts material to the contract by one party only.

Werner v. Rawson, Supreme Court of Georgia, 15 S. E. Rep. 813, 78.

AN EMPLOYE IS NOT RELEASED BY HIS EMPLOYER'S VIOLATION OF AN INDEPENDENT CONTRACT.—When one is employed by another to render personal services for a particular time, the violation by the employer of a subsequent contract having no connection with the contract for service will not justify the employe in refusing to abide by and perform his contract for the remainder of the time.

Stix v. Roulston, Supreme Court of Georgia, 15 S. E. Rep. 826, 68.

NOTICE OF LIEN IN INDIANA.—The statutes of Indiana require that the notice of a claim of lien shall specify the amount of the claim and the description of the property, and that when a material man furnishes material he shall so notify the owner before he furnishes the material. There are two separate notices, and neither used contain any reference to the other, but in a suit for foreclosure, both must be alleged and proved.

Adams v. Shaffer, Supreme Court of Indiana, 31 N. E. Rep. 1108, 76.

THE SALE OF DELETERIOUS IMITATIONS WILL BE RESTRAINED.—Independently of any right of persons to the exclusive use, as a trade mark, of the name applied by them to their products, the sale by others of a deleterious substance, represented by the latter to be in part or in whole the same substance in which the former are dealing, and of which they are the sole producers, and which is admittedly of a beneficial character, will be restrained.

City of Carlsbad v. Tibbetts, U. S. Circuit Court, D. Mass. 51 Fed. Rep. 852, 81.

BUSINESS MOSAICS.

If any person who is looking for office under the incoming Administration will send us his address and $3.00, we will send him the CALIFORNIA ARCHITECT AND BUILDING NEWS every month during 1893.

The best or none! This is what every person wants when looking for cooking or heating apparatus. Those who are wise in this respect will examine the stove department of the San Francisco Gas Light Company at No. 16 Post street.

The quality of paper for office use is of more importance than is generally given to it. We have tried many places before finding a quality that would fulfil the purposes of our use as that found at Bonestell & Co., 401 Sansome street. They have deafening and carpet felts; lining, sheathing and water-proof papers, and their roll detail and drawing papers are so far superior to others that we have heard many words of praise from those who have used them. Satisfaction will follow a trial. A word to the wise is sufficient.

Dearest reader, when using Dixon's pencils or crayons your eyes will fairly twinkle with delight to see how easily you can get the softest or strongest effects of light and shade. By their use the lights are left clear and sparkling, while the deepest shadows have a transparency which leads the eye still further back into the far distance. On account of their many good qualities they have displaced all other pencils in this office. To use them is to prefer them to any other in the market.

The wet spell, lately, has demonstrated the necessity of using sheathing paper under the outer boarding. The "Neponset" Waterproof Paper has been successfully used for this purpose for many years. Messrs. Dimmick & Low, agents, 221 Front street.

Architects in the City or Country who want "blue prints" of their drawings should send to W. H. Smyth, 258 Market street, this city.

George Goodman, 307 Montgomery street, is well known by all the old Architects and Builders on account of the superior quality of the artificial stone for sidewalks, walls, bulkheads and other work done by him. He has been a long time in the business and we have yet to see a failure in any respect of any of his work.

The Western Iron Works, 123-125 Beale street, have earned a reputation for first-class wrought iron or steel constructional work for buildings. They make anything in their line from a strap or anchor to the largest girder. Their Steel wheelbarrows have been in use for many years, and are considered the best in the market.

The Fitzgerald prepared wall plaster has recently had a "tilt" with the old line plastering, and in the language of the historian "gave em fitz." The Fitzgerald plaster won the prize on account of its superior merit. The largest and most costly buildings in this city are being plastered with it.

Art glass work, bending, cutting, staining, embossing, beveling, name and monogram work as done by Wm. Schroeder, 39½ Fremont street, is of such superior quality as to call forth words of praise wherever seen. Some of the finest business blocks and residences have had Mr. Schroeder's ornamental glass used in their decoration.

M. M. Heineman & Co., 32½ Fremont street, deals in "Linerusta Walton" and ornamental papers of all kinds. The late styles of Linerusta Walton have a beauty distinctly their own, and when touched up by the decorator, form a delightful relief effect for walls, etc.

Rubber goods and fire protective supplies of all kinds can be had of Frank McAllister, 24 Beale street.

F. H. Rosenbaum & Co., of 567 Market street, is one of the oldest houses dealing in mirrors, plate, window and ornamental glass in this city. This house can always be relied upon even when others fail.

For Pumps, Rams, etc., call on W. T. Garratt & Co. and for bronze work they stand above all other manufacturers on this Coast.

Fire-proof iron lath is taking the place of wooden lath in many situations where, heretofore, it was not considered practical. When it is thought of sufficient importance to investigate, then the difference in cost as compared with the difference in the fire risk becomes apparent, and the Pacific Company's Sheet Iron Lath are put on, thereby giving satisfaction to all parties.

The California World's Fair Commission has ordered fourteen of the Schenck Swinging Hose Reels, to be placed in the California building at Chicago for inside fire protection. This will materially reduce the rate of insurance on the building and contents, as by their use one man can put a stream of water on a fire in less that thirty seconds.

The J. L. Mott Co's. Specialties have been prepared with such care and knowledge of the subject in hand, that we are constantly reminded of the advantages to be obtained by their use. The rolled rim of the r bath tubs being enameled and thoroughly finished does away with any capping of wood or metal. The exterior may be ornamented with relief work or worked in plain tints with gold bands. Wherever these baths have been used they have given great satisfaction.

The San Francisco Mineral Paint Co. suffered severe loss by fire on the 12th inst. Their works in Alameda County were so far destroyed as to require new works. The company has been in operation only about two years, but the product was so exceptionally good that it came into favor at once. The demand for the paint has been so great that the mill was run to its full capacity, therefore, only a limited stock remains on hand. The insurance covered only a small part of the loss, but we learn they intend to rebuild immediately.

The Chapman Fire Hose Reel has again come to the front. See advertisement on page xii.

TENDERS TO BE RECEIVED.

Office of the Custodian, U. S. Appraisers' Stores Building, San Francisco, Cal., December 10, 1892. Sealed Proposals will be received at this office until 12 M. on the 28th day of December, 1892, and opened immediately thereafter for all the labor and materials required for miscellaneous alterations to the new U. S. Appraisers' Stores Building at San Francisco, California, in accordance with drawings and specification, copies of which may be had at this office.

Each bid must be accompanied by a certified check for a sum not less than 2 per cent of the amount of the proposal. The right is reserved to reject any or all bids and to waive any defect or informality in any bid should it be deemed in the interest of the Government to do so. All bids received after the time stated will be returned to the bidder. Proposals must be enclosed in envelopes sealed and marked, "Proposal for Miscellaneous Alterations to the New U. S. Appraisers' Stores Building at San Francisco, Cal.," and addresses to,

MR. T. G. PHELPS,
Custodian.

CITY BUILDING NEWS.

Allen near Cortland.—To build; owner, Ludwig Schaufel; contractor, F. M. Schweitzer; cost, $700; signed, Nov. 21; filed, Nov. 22; payments, $250, frame, $250, accepted; $200, 35 days.

Alvarado near Castro. Dwelling; owner, Catherine R. Parker; architects, Smith & Freeman; contractor, R. M. Murray; cost, $4,250; signed, Nov. 7; filed, Nov. 16; payments, $800, enclosed and chimneys built; $800, brown mortar on; $750, ready for hardware; $80, completed; $814, 35 days.

Broadway near Kearny. Carpenter work; owner, Wm. Bocarde; cost, $1,425; signed, Nov. 19; filed, Nov. 19; payments, $450, brown mortar on; $450, completed; $825, 35 days.

Bush near Central Ave. One-story cottage; owner, Elizabeth E. Parsons; contractors, Soule & Hoadley; cost, $2,550; signed, Nov. 12; filed, Nov. 14; payments, $178, frame up; $478, enclosed; $478, plastered; $478.50, completed; 637.50, 35 days.

Bush near Powell. Brick and concrete work; owner, Joseph Kennedy; architect, W. H. Lillie; contractor, Henry Larsen; cost, $2,271; signed, Nov. 4; filed, Nov. 9; payments, $1,000, walls ready for sills; $719, completed; $555, 35 days.

Bush near Powell. Plumbing, gas-fitting, etc.; owner, Mary F. Ryer; architect, W. H. Lillie; contractor, R. A. Vance; cost, $1,140; signed, Nov. 23; filed, Nov. 28; payments, $427.50 rough work accepted; $427.50, completed; $285, 35 days.

California near Drumm. Brick work; owner, Lanning Co.; architects, Coxhead & Coxhead; contractors, Richardson & Gale; cost, $7,300; signed, Nov. 4; filed, Nov. 16; payments, brick to be furnished by owner; 1st day of each month 75 per cent as work progresses; balance 35 days.

California near Dupont. Brick, stone work, etc.; owner, Geo. Reichley; architect, Chas. M. Rousseau; contractor, Wm. Bayford; cost, $1,400; signed, Nov. 26; filed, Nov. 26; payments, 75 per cent as work progresses; balance, 35 days.

Building News 12

WITH this issue we commence our fourteenth year. Having safely weathered the troubles that are popularly supposed to be associated with number thirteen, we now see no reason why we should not live to a hearty old age, and with the best wishes and encouragement of our numerous friends and patrons, shall endeavor to strive for the advancement of the interests of the Architectural profession and the different branches of the building interest that are so intimately associated with it.

ARCHITECTS Wood & Lovell, have entered into copartnership with Mr. Fuller Claflin of this city.

Messrs. Wood and Lovell will confine their attention principally to New York and Chicago, while Mr. Claflin will look after the Pacific Coast interests.

THE terms of the invitation by the Board of Trustees of the Stockton Free Public Library, to architects to submit competitive designs for a new library building, have been severely criticised by prominent architects.

The board, in issuing this invitation, does not seem to have had a very clear idea of an architects duties; but until the general public is better educated as to what an architect is called on to do, and becomes better acquainted with the real duties, responsibilities, rights and privileges of the profession, no great hope can be had that future competitions will be carried out on more just and liberal terms.

If building committees, before framing their invitations, would consult some member or members of the architectural profession, they could, with the advice and assistance that would be placed at their disposal, frame conditions that would secure them the good will of competitors, and attract instead of repel the collaboration of the architects.

To offer small premiums generally means that they will get cheap work in return. Let them try once in a while being liberal and we will predict that the result will be infinitely more satisfactory, and the designs submitted will average a higher degree of merit, than is the case at present.

To require of the architect bonds for the erection of a building within certain limits of cost, is to make him assume obligations that are not a part of his duties.

THE QUESTION OF AMENDING THE PRESENT LIEN LAW.

WE have received the following on the subject of the Lien Law from a firm of local architects. The ideas advanced seem to offer a practical solution of the vexed question, and appear to be worthy the consideration of law makers. Should any of the parties interested desire to criticise the position taken in this communication, space in our columns will be at their disposal:

The question of amending the present Lien Law of this State will undoubtedly be brought before the Legislature now in session, though whether the divergent interests of the numerous classes affected by the law can be united in support of any one proposition, appears problematical.

As far as concerns the building interests, and our remarks are made with particular reference thereto, the law as it stands, is not satisfactory to the very ones it was designed to benefit, and the different building associations and protective societies have different amendments to propose; if they can agree on a course of action, they can probably control legislation on the subject.

They fully realize the difficulties to be overcome, and hope to find a solution of the question, satisfactory to those who desire the protection of the law, and at the same time just to others who have equally as important interests.

The main object of this and all similar laws, is to protect the laborers, material men and subcontractors who co-operate in the erection of a building.

This should be done without injuring the interests, or jeopardizing the property of the property owner, and in our own opinion can be satisfactorily accomplished in a much simpler and more effectual manner than is done by the present statutes. Let it be made obligatory on the owner when he contracts with a builder or other mechanic, to exact a bond for the *full amount of the contract price;* let this bond be drawn, not only to guarantee the completion of the building, but also the *payments of all debts* contracted in its erection, and have it signed by two sureties; and lastly, *require these sureties to duly qualify* before a notary in double the amount for which they bind themselves.

This should afford protection to laborers, material men and subcontractors alike, while it should not meet with any opposition from reputable and reliable contractors, as it would protect them against dishonest competition and would not work any hardship on honest property owners.

The law as it now stands is but of little practical assistance to the creditors in any case, and is open to the very serious objection that it is so complicated that its practical working enables both dishonest contractors and scheming owners to defraud the creditors in nine cases out of ten where such intention exists.

Advantage is taken every day in the week of the ignorance and inexperience of an owner who builds for perhaps the first and only time, and where a dishonest contractor is not able to do up the owner, he always has the equally profitable alternative of doing his creditors, for in many, in fact most cases, the bonds as at present written on building contracts, are for but a small proportion of the amount of the contract, price, are signed by men who have no intention even when they have the means, of fulfilling the obligations they assume and are binding merely for the completion of the building whether the owners of the property or the creditors of the builder are protected is immaterial to them.

The Builder's Association, however, has been opposed to allowing its members to give bonds for more than one quarter the amount of the contract price, though it seems to us that their action is really against their own best interests; if it was made obligatory for a contractor to furnish *good and sufficient security*, the irresponsible and rascally contractors would soon be driven from the field, and the honest man, who desires to give a dollar's worth for the dollar he receives, would have a chance to make an honest living, which is hardly possible when the *pro-rata* man can so easily step in and under bid him, and secure work at prices that are actually insufficient to pay for the labor and material. But for all that the pro-rata man does not go without his profit! Oh, no! That is secured and pocketed at the time the first installment is received, and after that he does not worry; he lets the *other man* do that.

There is one other point in the existing law that should be changed, this is, the clause requiring the contract or the memorandum thereof, to be filed before the work is begun, failure so to do rendering the owner liable for the contractors debts; this sometimes gives a dishonest, designing contractor a chance to start the work before the actual filing takes place, and we have known instances where no secret was made of the sharp practice that thus enabled the contractor to cinch the owner. We think a reasonable time, say three days from the date of the instrument, should be allowed for this filing. Of course the object of the filing is to give the material man and subcontractor a chance to learn how much value is to be given for a certain amount of money, such information being necessary for their guidance in bargaining with the contractor; as a matter of fact, however, this information is very seldom obtained from the recorder's office, but generally from the architect's specifications, or the contractor himself. If the intention of the law was fully carried out the recorder's office would be practically turned into an architect's office or contractors' exchange, and the space and number of assistants at the disposal of the Recorder would be found to be ridiculously insufficient.

GOOD AND BAD ROADS.

COLONEL A. A. Pope, in an interview published in the *Examiner*, reads us a lecture on the subject of good and bad roads; the remarks he made are to the point, and we wish our legislators could be impressed with the immense importance of good, smooth, hard, level highways connecting every town, city and State in the Union; their benefits to every class of citizens cannot be disputed, though we are sorry to say, but few persons realize the far reaching effects of these benefits.

Macaulay has said that of all inventions, the alphabet and the printing press excepted, those inventions which bridge distance have done most for the civilization of our species: intercourse between communities and the development of commerce have shown communities the necessity of systematically prepared roadways.

"The Persians and the Greeks understood this, but the Romans knew it best of all. They built roads that would last for thousands of years, and they did it with the object of civilization, which question involved of course their domain. The old military roads of the Roman Empire constituted a system, the superior of which the world has never seen in its scope and the thoroughness with which it was perfected in all directions. They knew nothing about 'crushers' and 'asphalt' and fire brick, but they dug down into the ground and laid the solid foundation of rock and built the rest upward as scientifically and as honestly as an Egyptian pyramid. It seems to me when I look at your roads in California that it is a shame that some of your road-masters who plow for mud from the ditches and plaster it over, the middle of your highways had not had some good experience in the road gangs under the centurions of Julius Cæsar's army. The road is the sign by which you will best understand a people. If they have bad roads they are savages, for the road is the creation of man and the type of civilized society.

THE ROADS OF ROME.

"When Rome had 100,000,000 people under its sovereignty it was the capital city of such a network of highways that the common saying was, 'All roads leads to Rome.' You have very few respectable roads around San Francisco—in fact, I would name for my part only one, and that is the road at the Presidio, which, I believe, was built by the army. As for your Park, its roads are fair, but nothing to boast of. Go and judge them for yourself after a rain and compare them with one of the Roman roads in France or in England; otherwise you have not a decent highway throughout this State. Mind you, I have been here a number of times, and in fact I paid quite a visit to California in 1872, and I will confess that I have seen no progress in this direction.

"Why don't you do as we have done in Massachusetts—put your convicts to work building you honest roads—and be sure it would do much to make honest men of them? Certainly you cannot expect them to repent in an unhealthy cell or with morbid surroundings. Exercise and fresh air will build up their bodies and give them stouter hearts to resent temptation.

"I am endeavoring at the present moment to have Congress appoint a road department in the city of Washington similar to the Agricultural Department for the purpose of teaching students to become skilled road engineers and to establish a permanent exhibit, in which shall be shown sections of road illustrating the various methods of construction and also the best road materials and machinery. The petition which we have made to Congress will have 1,000,000 names and perhaps more, and we propose to have an exhibit in the Columbian Exposition next year which will explain to the people the secrets of road engineering.

SHOULD ISSUE STATE BONDS.

"Under your present system in California the farmers object to the extra tax for building a road in a decent and substantial fashion, and in many cases they are just; but I don't see why the State should not issue bonds with an extension of say fifty years to build a series of decent roads in the south and in the north. Let posterity pay for it, for certainly posterity gets the entire benefit. Why should we saddle ourselves entirely with the debt, and why should we not allow it to be shared by those who will appreciate the plan we have given them?

"With all our scores of localities in California our farmers are practically shut out from connection with the world for six months of the year. With the first rain the roads become heavy, and grow worse and worse until it is impossible for vehicles to obtain access to a valley or mountain district. Really this is almost the universal case in California. Your people are always talking about your railroads, and howling for a branch line to go there or come here, when you have it in your power to construct good market roads on radiated lines that will serve your purpose just as well as railways."

GLANDERS has been looked upon by the general public as a disease affecting the horse alone, and its prevalence gave no reason to apprehend any great danger to the human being, notwithstanding the health authorities have cautioned the public against the infectious nature of the disease. In one of the hospitals of London, Dr. Collie reports two cases of glanders that occurred recently. Both cases proved fatal.

In the first case, the patient, who was twenty-five years of age, was stricken with this disease while working among sick horses; he died after an illness of nineteen days.

In the second case the patient was twenty-six years of age and had charge of a sick horse, he was sick thirty-five days when he died.

This opens up a new important feature to provide for in hospital construction and in the treatment for a disease always fatal.

WHO will be first to try Sir Edwin Arnolds' recommendation and introduce the imitation of a Japanese House for a country residence?

This is what he writes in their favor, in an article entitled "Japan Revisited," from the January number of the *Cosmopolitan Magazine* under the head of "Homes of the People."

"The longer I myself live in these exquisitely neat and clean dwellings, the more I find to admire and praise in them; and then, moreover, they are decidedly healthy, so extremely inexpensive to erect, so absurdly easy to furnish, and so entirely refined, becoming and artistic as abodes for people of taste and of nice habits. The Japanese abode in which I passed my days of repose at Atami could have been purchased, I believe, for eight or nine hundred yen, or say $600. It certainly had not cost as much to build, and yet it was good enough for anybody of simple habits to live in.

"The rooms are measured by the number of mats they contain, for the mats (tatahi) of Japan is of an absolutely fixed standard, and does not vary a hairs breadth in length and breadth, all over the Empire. Each apartment is called by the number of jo, or mats, it will contain, each mat measuring six feet in length by three in breath."

WHE eminent Swiss savant Hassler, he who organized the U. S. Coast Survey, once made a move to secure an increase of salary. Failing through the ordinary channels, he obtained an interview and preferred his request to the President in person.

It is on record that Old Hickery treated the Professor with all that suave courtesy of which he was a perfect master, if he did not always use it. While admitting the value of the service and justice of the demand he remarked that the compensation asked for was more than the pay of the Secretary of the Treasury, under whose orders the work was being done. "And" said he, "Professor, would it not be a curious thing for you as a subordinate to Mr. Woodbury, to receive more pay than he does?"

Quick, sharp, pungent came the reply; emphasized, no doubt, by the broken English vehicle which conveyed it.

"Meester Voodbury! Meester Voodbury!! Plentee—plentee Meester Woodbury.—Von—von Meester Hassler."

WALLS A CENTURY OLD.

THE corner-stone of the white house was laid on Oct. 13, 1792; a little less than 300 years after the discovery of America by Columbus. The commissioners had, on the previous March 14th, advertised for plans for a presidents' house and on July 16th, they held a meeting in Georgetown and examined the plans that had been submitted. As is history now, they accepted the plan of James Hoban, a Dublin architect, who had made designs for the president's house, framed, it is said, on the model of the mansion of the Duke of Leinster at Dublin, the palace of royalty in Ireland. The stone was in part quarried at Aquia Creek, Md., and brought to a new wharf, built for the purpose, near the foot of Seventeenth street. No memorial of the ceremonial of laying the corner-stone has been discovered. It is certain that the Virgin Free Masons, who had in 1791 laid one corner-stone in the District of Columbia, and who in 1793, assisted in laying the corner-stone of the capitol, did not participate in laying the corner-stone of the white house. It was probably laid by Maryland Masons. The building began to rise, however, and in eight years was ready for occupancy. The donations of Maryland, $72,000, and of Virginia, $120,000, assisted to pay for it; and in April, 1800, four months after Washington's death, congress appropriated $15,000 to pay for its furniture. Thenceforward it became the chief mansion in the nation. From the time when Mrs. John Adams hung the family wash in the east room to dry to now it has been a home set upon a hill to be seen by all. It has had the fortune of the humblest homes in the land—marriage, births and deaths. Its joys and sorrows have a wide echo, and now sympathy flows toward it from every portion of the land.—*Real Estate Record and Building News.*

Study No 5 by Albert Pissis.

which is to cost $12,000, was raised by a direct special tax—this is the first high school building to be erected under the law passed by the last legislature. Several others will however most likely be built in other parts of the State.

THE perspective drawing of a design for the proposed new French Hospital, illustrates the plans submitted by J. Marquis, architect.

In addition to this lithograph, and to the illustrations of the designs awarded the first and second prizes which were published in the December number, we give a number of block plans showing the disposition of the different buildings and the general arrangement of a number of other designs submitted by the different competitors whose names are attached to the respective cuts. The studies prepared by the consulting architect of the building committee, Mr. Albert Pissis, were made previous to the issuing of the invitation to architects to submit designs, and were for the purpose of enabling the committee to obtain a clear idea of the requirements of the new hospital, preliminary to preparing the programe of the competition.

The following table of reference will explain the lettering on the plans:

A—Administration Building.	*M*—Morgue.
B—Male Medical Ward.	*N*—Engine House.
C—Female Medical Ward.	*O*—Laundry.
E—Invalides Pavilion.	*P*—Stable.
F—Contagious Pavilion.	*Q*—Bath House.
G—Corridors	*R*—Male Surgical Ward.
H—Kitchen.	*S*—Female Surgical Ward.
I—Water Closets.	*T*—Paying Patients.
J—Operating Room.	*V*—Disinfection.
K—Nurses' Rooms.	*W*—Employees' Quarters.
L—Pavilion for Tuberculosis.	*X*—General Dining-Room.
	Z—Single Rooms for Patients.

ILLUSTRATIONS

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

THE Elevation of Germania Hall, which is to be erected on the north side of Bush street near Powell, in this city, is from the designs of the architect, W. H. Lillie.

THE study for a house at Vacaville, for Mrs. Thayer was furnished us by the Messrs. Polk, architects, of this city. The building has been treated in the Brittany style of a gate lodge, all the outer walls are covered with split cedar shingles, left in their natural state.

THE Union High School, No. 1, is to be erected in Livermore, Cal., under the superintendance of the architects Messrs. Percy & Hamilton, the money for this building

NOTES & COMMENTS.

During the year 1892 over 12,500 buildings were erected in Chicago at a cost exceeding $63,500,000.

The German Imperial Commission on Cholera has announced that wine—claret or hock—will kill the bacilli of Cholera in a few minutes. Tea will kill them in an hour.

There has been discovered in the northern part of this state a very soft red sandstone that can be whittled on first taking out of the ground like a piece of pine wood and hardens in the sun in a few days so that it will stand pressure. The parties owning it say that when they put it on the market it will supersede terra-cotta.

W. J. Edbrooke, the Supervising Architect of the United States, who will draw the plans for the new Post Office, corner of Seventh and Mission streets, states that one thing that he will have to provide for is the pneumatic tube, which will be used for the speedy delivery of mail from the main office to the sub-stations throughout the city. As this is one of the latest modern improvements in that line, residents in the outside of the city will have a quicker delivery of their mail.

THE OWNERSHIP OF PLANS.

THE question as to the ownership of plans drawn by an architect, for use in superintending and guiding the construction of a building, is by no means settled as a matter of law. It sometimes becomes a question of grave importance to the architect, and to the owner as well, by reason of the large interests involved.

Of course those cases are to be excluded from this discussion where contracts are made with architects to prepare and furnish plans and specifications, for the established law of contracts will cover them. The difference between these cases, where the making and furnishing of plans is the object of the contract, and cases where architects are formally employed only to prepare plans for and superintend the construction of a particular building, the plans being regarded only as means to another end, will readily be seen. These last suggest the question now considered.

Perhaps it will be intimated that in England, that older country from which we have derived so much of our law by inheritance, a precedent will certainly be found. But up to a recent date, there were no decisions in the regular reports there upon this question. Returning to our own country, and taking up the latest, best and practically only treatise that we have on the law of building and buildings, especially referring to building contracts, etc., namely, that of A. Parlett Lloyd, issued in 1888, there will not be found the least assistance in the solution of this question.

Many architects would present the suggestion that the schedule sanctioned by the Royal Institute of British Architects, and confirmed at a General Conference of Architects of the United Kingdom, in 1872, and the Schedule of Charges and Professional Practice of Architects indorsed by the American Institute of Architects disposed of the whole matter, especially as the former states, in section sixteen, that in "respect of the ownership of drawings and specifications," it has hitherto been the general custom for the architect to be paid for their use only, those documents remaining his property, and the latter declares "that drawings and specifications, as instruments of service, are the property of the architect." But in 1870, the English Court of the Exchequer declared that the provisions of the Code of the professional institution of architects issued in 1862, were not binding, as their charges were unreasonable, and it was held, "contrary to good sense and justice," and not a legal standard. "Supposing the custom to exist," said the court, "that an architect in the event of his employment being put an end to, is entitled to be paid for the plans and retain them, such a usage is not a reasonable one." (Ebdy v. McGowan, reported in the *Times*.) The Supreme Court of the state of Illinois. (Wilson v. Bauman, 80 Ill. 493.) has also decided that where it was attempted to prove a certain custom in the case of the employment of an architect, the other side might show if it could, "that there was no such custom, except by architects" and that in order to be available to the architect, "such custom must be as well known to builders and contractors as to architects, and it does not require special skill or science to know of its existence." Moreover what will be of special significance after the declaration of the English Court of the Exchequer above, "a custom or usage to affect a given contract, must not be in opposition to any principle of general policy * * * or against the established principles of the law. Besides this, it must be generally acted upon as known and established, and so well settled and so uniformly acted upon as to raise a fair presumption that it was known to both contracting parties, and that they contracted in reference to it and in comformity with it."

In the old case of Nourry v. Lord, decided by the New York Court of Appeals in 1866, (3 Abbott, 392) where the general question litigated at the trial was, whether an architect was employed to draw a plan of a building or not, the fact that the architect sent for and took away plans he had submitted, it was claimed, indicated that he had not been employed and should not be paid, but the court held that while the circumstance was entitled to consideration, it was not conclusive that the services were wholly voluntarily, or should not be paid for, the architect being allowed compensation in that case for his labor.

The well settled doctrine, as stated by the United States Supreme Court, (Chicago v. Tilley, 103 U. S. Rep., 146,) should also be considered in this connection, that "A party to a contract, who has performed part of it according to its terms, and is prevented from completing it by the failure of the other party, is entitled to compensation for the work performed." This however does not settle, as a little reflection will show, the question of the ownership of the plans.

So far in this article, architects have been treated as all being of one mind, and following the old English and present American rules intended to govern their profession. This however is not true, for enough, if not a large percentage, of architects, and good ones too, can be found, who, in case work is abandoned, after preparation of plans and specifications, will give up these on payment of their charges for preparing them. This will make it extremely difficult to do anything toward proving such a custom as would have the effect of law.

The only wise and safe thing for architects to do is to make a contract in writing in all cases before entering upon an employment, and provide in the contract who shall own the plans if work is abandoned, as well as when the building is completed.

SPIRAL SAFETY ROPE.

THE administration of the Eiffel Tower in Paris invited the municipal council of that city, the heads of the fire department and members of the press to witness a descent by the daughter of the inventor, Mr. Holthausen, with her two small children, from the first platform of the tower by means of the spiral safety rope. The decent was accomplished to the entire satisfaction of everybody—so much so, in fact, that the vice-president of the life-saving department attached to the fire department made another descent himself, because he considered it to be so easily accomplished. Mr. Holthausen and others dissuaded him from undertaking so perilous a performance, as he had not previously examined or been sufficiently instructed in manipulating the rope, but he insisted, and accomplished the descent to the full relief of those present. As far as could be seen by your correspondent, a hollow steel cylinder, with a large spiral screw-thread inside, worked upon a sufficiently thick rope. The upper end of the rope was by a large hook securely fastened to a bar of the platform. The lady enveloped herself in a heavy canvas belt reaching from under the armpits down to the lower part of the body, which secured her upright position, then fastened a hook on the cylinder and swung herself into space.—*Fire and Water.*

ADVANCED BUILDING CONSTRUCTION, an illustrated manual for students, by the author of "Notes on Building Construction," is a volume containing all the information required for the examination in the second stage or advanced course of building construction held annually under the direction of the Science and Art department, South Kensington. For sale by Payot & Upham.

The Drainage of Habitable Buildings, by Lee Beardmore, is a reprint and revision of a series of articles which appeared in THE PLUMBER AND DECORATOR, AND JOURNAL OF GAS AND SANITARY ENGINEERING, in which is described in detail the requirements of different classes of buildings, and the different methods that may be employed for the disposal of sewage. For sale by Osborne & Alexander, price $1.50.

The January number of the ENGINEERING MAGAZINE, has a very readable article on the proper way to select an architect for public works, and explaining also the many causes that exert an undue influence in swaying the judgment of building committees.

The article cuts both ways, showing the lack of judgment often displayed by members of a committee, and the way that a certain class of architects take advantage of this ignorance to their own profit.

PRACTICAL PAPER HANGING, a hand book on decoration in paper and other materials, with practical instructions on hanging them, by Arthur Seymour Jennings.

This book aims to represent from a practical point of view, the paper hanging business as it exists to-day, with all the changed conditions produced by the more or less recent introduction of different materials for wall decoration, such as burlap, buckram, silk, tapestry, lincrusta, etc.

Published by William T. Comstock, 23 Warren street, New York, price $2.00 postpaid.

THE AMERICAN GLOSSARY OF ARCHITECTURAL TERMS, by Geo. O. Garnsey, Architect.

This is the third edition of a very complete and concise illustrated compilation of terms used in architecture. Over three thousand words are defined, and five hundred engravings make the meaning clear.

Published by the National Builder Publishing Co., Adams Express Bldg., Chicago. Price $2.00 postpaid.

In the October number of THE BRICKBUILDER appears a communication commenting on the very favorable results that have followed the appointment of a city architect to take charge of the public buildings in Boston. It gives Mr. Wheelwright the credit of having designed a number of artistic buildings, by employing cheap but durable materials, thus solving one of the most difficult problems an architect has to study. Illustrations of a number of these buildings including an engine house, a police station and a public school are given in the text.

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute of Architects, meets second Friday of each month at 408 California street.

Geo. H. Sanders, Pres. W. J. Cuthbertson, Vice-Pres.
Oliver Everett, Sec. John M. Curtis, Tres.

Technical Society of the Pacific Coast, meets first Friday of each month at Academy of Sciences Building.

John Richards, Pres. L. Wagoner, Vice-Pres.
Otto Von Geldern, Sec. Geo. F. Schild, Treas.

California Electrical Society, meets the first and third Monday evenings of each month at the Academy of Sciences Building.

Geo. P. Low, Pres. C. O. Poole, Vice-Pres.
W. I. Crosett, Sec. O. Brooks, Treas.

Master Painters' Association of the Pacific Coast.

E. M. Gallagher, Pres. G. Jarman, Sec. H

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

Liability on Bond of Contractor.—A surety on the bond of a contractor for the erection of a building is bound only in the manner and to the extent provided in the obligation, and, if payments are made to the contractor in excess of the amounts due on the estimates, he will not be liable for such excess.

Gray v. School District of Norfolk. Supreme Court of Nebraska, 53 N. W. Rep. 377, 58.

Responsibility for Mistakes.—No man is infallible; the wisest make mistakes; and for that reason the law holds no man responsible for the consequences of his mistakes which are the result of the imperfection of human judgment; and do not proceed from fraud, gross carelessness, or indifference to duties.

Corle v. Monkhouse, Court of Chancery of New Jersey, 25 At. Rep. 157.

A Dwelling House is a Castle of Defence.—A person's dwelling house is a castle of defence for himself and his family; and assault upon it with intent to injure him, or any of them, may be met in the same way as an assault upon himself, or any of them, and he may meet the assailant at the threshold, and use the force necessary for his or their protection against the threatened invasion and harm.

Wilson v. State, Supreme Court of Florida, 11 South Rep. 556, 77.

Immaterial Error in Lien Statement.—Under the California statute, prescribing what a notice of claim of mechanic's lien shall contain, a statement of the date of completion of the work not being required, a mistake in stating such date will not affect the lien where the complaint in an action to enforce such a lien alleges that the notice was, in fact, filed within thirty days after the completion of the work. Where a notice of claim of mechanic's lien by a subcontractor is made a part of the complaint, it is not open to a general demurrer on the ground that such notice fails to set out the plans and specifications of the original contract.

Slight v. Patton, Supreme Court of California, 31 Pac. Rep. 248, 115.

When Contracts can be Abandoned and Future Profits Recovered.—Breaches of contracts may exist in a great variety of cases which will justify the party not in default in rescinding and putting an end to the contract, thus freeing himself from its obligations, which will not give him the right to abandon further performance, and sue for future profits. In order to the exercise of the latter right, it is not sufficient that the other party has violated and committed breaches of the substantial provisions of the contract, and manifests an intention to continue such breaches. The

breach must be of such character as to have legal effect of preventing the party not in default from proceeding further with the execution of the contract, or to render its objects unattainable by proper performance.

Lake Shore & M. S. Ry. Co. v. Richards, Supreme Court of Illinois, 32 N. E. Rep. 402, 134.

WRITTEN CONTRACTS WHICH MUST BE THEIR OWN INTERPRETERS.—Every contract lawfully made between parties competent to contract and dealing on equal terms, or, as the phrase is, "at arm's length," in good faith, and without fraud or mistake, which is embodied in unambiguous terms in a duly-executed writing, and signed by the parties to it, is its own interpreter; and the courts have no lawful power to construe it, nor to admit any testimony outside of itself to modify or affect its operation. The terms of a valid written contract cannot be contradicted or varied, much less squarely contravened, by verbal evidence of what occurred between the parties previously thereto or contemporaneously there with.

Poyton v. Stuart, Supreme Court of Appeals of Virginia, 16 S. E. Rep. 160, 114.

CONSTRUCTION OF ORDINANCES RELATING TO ELEVATORS IN BUILDINGS.—City ordinances requiring elevators to be built and protected in a certain way, and to be periodically inspected, do not create a civil liability against a person who violates them towards one who is injured by an accident that was in no way caused by such violation. And a city ordinance which requires machinery that is so located as to endanger the lives and limbs of those employed in the building to be so covered or guarded to insure against injury to such employes, gives no right of action to an injured person who is not an employee, as where such a person is injured by the counterweight of an elevator. Gibson v. Leonard, Supreme Court of Illinois, 33 N. E. Rep. 182, 119.

NOTICE OF LIEN IN OREGON.—A notice of mechanic's lien, which states merely the lease of the ground to a certain person, on which is the building sought to be charged, and after description of building and ground, and mention of owner of the ground, declares the person first named lessee of "said property," does not show, either directly or by necessary inference, who is the owner of the building, and is not, therefore, within the requirement of the Oregon Statute.

Gordon v. Deal, Supreme Court of Oregon, 31 Pac. Rep. 286, 82.

A COLLEGE HOSPITAL.

YALE is about to establish a hospital for students taken sick at college. It will be completed this month. This novel idea originated, it is said, with Mrs. Cornelius Vanderbilt, whose son recently came to his home from Yale to die. He had contracted typhoid fever while in New Haven, and it is said was not at first tended as carefully in that city as the seriousness of his ailment warranted. Mrs. Vanderbilt and a number of other prominent ladies of New York have given $40,000 for the hospital.

Now this is well; it is an excellent movement, and does credit to a generous heart touched by grief. But if to this hospital addition there is attached a system for training the students in the art of nursing, something practical will be done, the benefits of which will be immeasurable.

The one thing a man cannot do as a rule, who has not been specially trained to it, is to properly nurse the sick. If Yale is able to add to its hospital two or three skilled trainers and lecturers to instruct students how to care for their sick fellow students, the former will go out in life at the end of four years with an accomplishment of a high order, and that will contribute immensely to their usefulness and general value as men.

Thus every year, after the first three, Yale might easily turn out fifty men who would know how to care for ordinary sufferers in ordinary cases at least; how to treat those who faint, those with broken limbs, patients in fever, delirium, and so on; how to check bleeding, to reduce inflammation, to ventilate and heat the sick room; how food for the sick should be prepared and similar useful knowledge. The idea suggests a new and most desirable accomplishment for collegians.—*Sacramento Union*.

THE last meeting of the Academy of Medicine at Paris seems to have sadly demoralized the microbist. Among other things, Prof. Peter remarked: "*Apropos* of cholera, I desire to call attention to the evolution that bacteriology is undergoing, and the role that morbid spontaneity tends more and more to play in this evolution. Dr. Brouardel has asked me how I can believe that choleriform accidents are identical when the germs are different. I reply that I admit nothing. I only state the facts observed. *I have seen different germs produce identical accidents.* I can go further, and say *identical germs can produce different diseases.* Besides, what I have said I have seen other observers have seen. I have seen the *bacterium coli*, the virgule bacillus of Finkler, produce cholera. I have likewise seen the bacillus coli produce *cholera*, *dysentery* and *typhoid fever*. From these facts I conclude that the bacillus is not unhealthy by itself, but that it may become so, and acquire new properties in the midst where it vegetates. I have come to the conclusion that we ourselves, owing to some internal modifications, develop cholera and dysentery, and it is this change that modifies an innocent bacillus and endows it with toxic properties, that it may transmit to others. The inoffensive bacillus is cholerized by the cholera, dysentery by dysentery, etc."

Here are a few examples quoted by Peter: Gilbert and Girode found in an epidemic of cholera nostra that the bacilli coli taken from the stools of patients dying from cholera experimentally provoked a cholera type. The same bacilli were observed in 1891 in Peter's *service* in dysentery cases. In all these cases the bacilli coli became choleraic after being in the organism of a patient suffering from cholera. Peter then cited, in the same order of ideas, the work of Roux and Rodet, of Lyons.

So, after all, it appears that microscopy reveals rather the changes wrought by disease that poisons the innocent bacilli and makes them in turn poisonous when inoculated, than being the primal cause of maladies. The supposition would be that the more attenuated the amount of virus in the infected bacillus, the less violent tpye of disease it would transmit. Ten years from now all will be forced to admit that poisoned bacilli are the effect and not the primary cause of disease.—*Cincinnati Lancet-Clinic*.

A hysterical state of mind exists in certain localities in some of the older countries. It appears that the Royal Family of one of the most powerful nations has been exposed to the risk of infection from the fact that the "tailor made clothing" for the Royal Family might possibly have been made by the tenement house workers in the same shop and by the same workers, who made the raiments for the workhouse emigrants. For some years the local health boards have been learning the necessities and prescribing rules and sanitary conditions under which such work was to be done, while Royalty contented itself mainly in light Christmas presents and speeches overflowing with advice in reference to industry and contentment under their allotted circumstances.

Like all contagious diseases which begin their course in obscure places and are liable to be conveyed to the Crown center, so this great public evil which has been permitted to fester under insanitary conditions is spreading to such an extent that individuals, who have heretofore taken no part in the work, are now moving to secure their own protection. Whenever the English people recognize the importance of the subject as a national problem that needs immediate correction, then such provisions will be made and enforced as to eventually lead to such an improvement as will, probably in this case, cause the tenement house system of England to become the model for the world.

BUSINESS MOSAICS.

On page V is a cut showing the Patent Flushing Rim Washout Water Closet Range of the J. L. Mott Iron Works. It is especially adapted for Hospitals, Schools, Factories, etc., and can be made in any number of seats by putting two or more ranges together.

The well-known firm of Henry Cowell & Co. wish to inform the architects that they have a plentiful supply of J. B. White & Bros'. Improved Marble Cement on hand and shall continue to keep stocks of the same to fully supply the market at reasonable prices. Therefore, architects need not hesitate to stipulate for Keene's Cement in their specifications.

Owing to the patterns having been burned in the late fire in Milwaukee, the completion of the Kieckheffer Elevators now contracted for St. Joseph's Home and Examiner building, will be delayed about four weeks, the machinery, however, is on the road, and upon its arrival, no time will be lost ir putting the machines in working order.

The Westminster Slate Co. wish to call the attention of our readers to their advertisement on page xviii. Their slate being of superior quality should readily find a market here. Architects would do well to look into the merits of this article and satisfy themselves. It is made in sizes ranging from 24x14 to 12x6. The finished product being shipped to its destination in crates, a saving of 10 per cent in breakage is made. W. A. Jones, Agent, 330 Pine street.

The "Neponset" Waterproof Paper is coming more and more in prominence on this coast as its excellent qualities are becoming better known. In the east where it has been extensively used for years it give the utmost satisfaction and architects who are looking for a good paper for sheathing, lining or roofing purposes cannot do better than look into the merits of the "Neponset." Dimmick & Low are the agents and will be pleased to give any information required. See advertisement on page iii.

The preservation of wood at the present time is but little thought of, lumber being cheap, but it is not the additional expense of preserving it that should be considered, it is the cost of replacing the wood that is liable to decay or rot. Carbolineum used for the purpose for which it is intended, that is solely for the preservation of wood, and at a very small additional expense preserves the wood one hundred per cent. Having been used successfully for twenty years in foreign countries and for about half that number in this; Old Father Time sanctions the above assertion. Muecke & Co are the agents, 319 California street.

We have received from Messrs. N. & G. Taylor Co. of Philadelphia, a photograph of the interior of one of their buildings in which is carried on the manufacture of the special brand of genuine Taylor "Old Style" extra heavily coated roofing plates, for which the firm has a national reputation.

This firm has gone to great expense in constructing the best possible machinery and providing the most perfect equipments required for the production of the finest grades of roofing plates.

Those who want to know how a tin plate factory looks, are invited to call and inspect.

Yellow Pine does not splinter or color, but wears very smooth. It has no equal for halls, stores and stage floors. See advertisement on page xii.

The Acme Company of Oakland has during the past year become one of the principal dealers in Fire Hose and Reels specialties both here and in Oakland.

Their several special makes of Reels—The Peerless—Perfection and Acme—are all well-known to the general public and the Peerless as a Fire Hose Reel is among the best and most compact reels made, having fewer connections and bends and therefore the simplest.

Their Garden Reels have been well conceived are very largely used by Oaklanders especially.

In addition to the Reel business, they represent the Chicago Fire Hose Co. of Chicago and carry a full line of Garden Fire and Fire Department Hose of every description.

Though their office and principal plan of business is in Oakland this does not interfere with their city trade as numerous business places on this side are daily being equipped by them.

The new and handsome Macdonough Theatre and Building and the Metropole, both of Oakland, are among their most recent equipments.

Hurrah for the Sash Balance. *From* G. J. H., *Youngstown, O.*- I have just been through an experience that I am sure the readers of your valuable journal will be glad to know, and my getting out of a tight place will be interesting. I built a house with a veneered brick first story, and as the brick would be weather tight, we decided to dispense with the sheathing boards on the first story. It was thought that plate glass would be the proper thing for the first story front windows and accordingly we made the frames allowing for 1¾-in. sash. Now you will observe that by leaving off the sheathing it only left me pocket room of 4¾ inches, the width of a 2x4 studding when sized, and to make the matter worse, I found when the frames were brought to the building that as there was no sheathing to go outside of the studding, the blind stop must be flush with the stud. Hence, I was obliged to nail a strip on to receive the blind stop for nailing, and that took off ⅞-in. in thickness of pocket. Our windows—two of them were very wide, 60 in. glass—and when we come to weigh the lower sash we found them 72 lbs. each. Nothing in the shape of a weight, not even in lead, could I get that would slide in the cramped pocket space, and the house being plastered and the finish on, I thought my name was "mud." Having had a little experience with sash balances in light weight sash, I determined to investigate and see if a pair could be obtained that would lift a heavy sash, and looking over a catalogue of the Pullman Sash Balance Co., which I had sent for by seeing an advertisement in this paper, I found I could get them and for even heavier sash. I got two pair for the weight required and put them in place and the sash work as easily and smoothly as the best pulley and weight ever hung. All the damage done was a little breaking of the plaster at the place where it projected past the casing, and this was very easily patched. The expense of the balance was very trifling, not as much as special weights and allumiunum cord would have been. If I have any more sash to hang the balances will be my preferences.—*The American Builder*.

CITY BUILDING NEWS.

Broadway near Buchanan.—Two-story frame; owner, Mrs. S. E. Bourn; architects, Percy & Hamilton; contractor, F. W. Kern; signed, Sept. 19; filed, Dec. 8; cost, $13,888.

Bryant near Fifth. Two-story frame building; owners, Weston Basket Mfg. Co.; architect, W. F. Veitch; contractor, A. J. Duke; signed, Dec. 6; filed, Dec. 6; cost, $1,800.

California Ave. near Powell Ave. Addition and general renovation; owner, F. Brandenhof; contractor, F. M. Schweitzer; signed, Dec. 5; filed, Dec. 6; cost, $465.

Clay near Taylor. Alterations and additions; owner, Mrs. J. F. Brown; architect, G. A. Broadwell; contractors, H. Hodgkins, J. E. Kinsley; signed, Dec. 5; filed, Dec. 6; cost, $2,465.

Clementina near Fourth. Two-story frame; owner, Wm. Bacome; architect, Oliver Everett; contractor, Jno. F. Millerick; signed, Jan. 9; filed, Jan. 9; cost, $2,620.

Dupont and Filbert. Furnishing interior of church; owner, Rev. R. de Corolis; architect, Chas. J. I. Devlin; contractor, Daniel Powers; signed, Dec. 3; filed, Dec. 5; cost, $3,300.

Dupont near Sacramento. Excavating brick work and stone cutters cast and wrought iron; owner, Paul Flury; architects, Pissis & Moore; contractors, Leibert & Hoffman; signed, Dec. 20; filed, Dec. 21; cost, $8,300.

Eddy near Laguna. Works to build; owner, A. Marks; architect, W. O. Banks; contractor, O. E. White; Jan. 7; filed, Jan. 7; cost, $1,700.

Ellis near Steiner. Two-story frame; owner, Annie Schilling; architect, Ed. Burns; contractors, Petterson & Person; signed, Nov. 28; filed, Dec. 2; cost, $1,200.

Eight near Minna. Alteration and additions; owner, M. J. Brady; architect, T. J. Welsh; contractor, H. Jacks; signed, Jan. 7; filed, Jan. 9; cost, $2,740.

Filbert near Jones. Two-story frame; owner, Mrs. L. Gehrels; architects, John & Balczynski; contractor, F. L. Hansen; signed, Dec. 27; filed, Jan. 3; cost, $6,440.

Folsom near 26th. Two-story frame; owner, H. B. Angell; architects, Percy & Hamilton; contractor, W. H. Wickersham; signed, Dec. 21; filed, Dec. 21; cost, $9,369.

Fourteenth and Sanchez. Bakery and stable; owner, Sarah E. Slocum; architect, G. A. Kirk; contractors, Gardner & Boyd; signed, Dec. 10; filed, Dec. 12; cost, $10,859.

Fourteen near Sanchez. New bake ovens; owner, W. H. Ward; contractors, P. Glaser, C. Plaetrich; signed, Nov. 17; filed, Dec. 12; cost, $3,800.

Golden Gate Ave. near Devisadero. Two-story frame; owner, Catherine Sullivan; architect, T. J. Welsh; contractor, Edward Mooney; signed, Dec. 20; filed, Dec. 27; cost, $6,140.

Golden Gate Park. Work for pumping station; owners, Commissioners Golden Gate Park; architect, A. Page Brown; contractors, Gray Bros. Art Stone Pav. Co.; signed, Dec. 20; filed, Dec. 29; cost, $10,900.

Greenwich near Taylor. To build; owner, Claus Wreden; architect, W. Winterhalter; contractor, A. Guilbert; signed, Dec. 9; filed, Dec. 10; cost, $2,457.

Hermann Street. Alterations and additions; owner, A. T. Winn; contractor, Ivory Wells; signed, Dec. 9; filed, Dec. 10; cost, $325.

Howard near Sixth. Alterations and additions; owner, B. Coposn; contractor, John Miron; signed, Dec. 30; filed, Dec. 31; cost, $1,351.

Leavenworth near California. One-story cottage; owner, Jas. L. Shearer; architect, C. H. Skidmore; contractor, Adolph Petry; signed, Dec. 12; filed, Dec. 13; cost, $1,545.

Market near Powell. Mantels complete; owner, Annie Donahue; architect, Chas. I. Havens; contractors, W. W. Montague & Co.; signed, Dec. 7; filed, Dec. 8; cost, $81.00 per mantel.

Missouri near Napa. Cottage, one-story and basement; owner, Mrs. E. D. Roberts; architect, R. O. Davis; contractor, R. O. Davis; signed, Dec. 19; filed, Dec. 20; cost, $1,200.

Montgomery. Alterations to office; owners, Selby Smelting & Lead Co.; architect, Jno. Marquis; contractor, Chas. Condy; signed, Jan. 5; filed, Jan. 7; cost, $1,810.

Noe between 16th and 17th. Frame building; owner, Annie Gimpel; contractor, Alfred Hawkins; signed, Jan. 4; filed, Jan. 11; cost, $1,263.

Park near Castro. Outside mill and carpenter work; owner, Geo. Whittell; architects, Coxhead & Coxhead; contractor, M. C. Lynch; signed, Nov. 26; filed, Dec. 3; cost, $6,400.

Pierce near Turk. To build; owner, Jno. Doherty; architects, J. J. and T. D. Newsom; contractor, A. B. Larmer; signed, Jan. 9; filed, Jan. 11; cost, $2,700.

Pine near Franklin. Painting and roof finishing; owner, Gustav Sutro; architect, Julius E. Krafft; contractor, P. N. Kuss; signed, Dec. 16; filed, Dec. 17. cost, $1,380.

Post near Grant Ave. Passenger and freight elevators; owner, B. & J. Schweitzer; architect, C. R. Wilson; contractors, A. J. McNicoll & Co.; signed; Dec. 13; filed, Dec. 14; cost, $1,850.

Post near Grant Ave. Alterations and additions; owners, B. & J. Schweitzer; architect, C. R. Wilson; contractor, S. H. Kent; signed, Dec. 13; filed, Dec. 14; cost, $18,044.

Prescott near Vallejo. Three-story tenement house; owner, Katarina Schele; contractor, Caspar Zwierlein; signed, Jan. 4; filed, Jan. 5; cost, $3,500.

Scott near Page. Two-flats; owner, Rane Levy; architect, J. B. Wuersching; contractors, Home Building Co.; signed, Dec. 7; filed, Dec. 20; cost, $3,760.

Sharon near Sixteenth. Two frame buildings; owner, Theo. Blodes; architects, B. McDougell & Son; contractors, P. J. & M. Brennan; signed, Dec. 31; filed, Dec. 31; cost, $4,341.

Shotwell near 18th. Brick work, etc.; owner, Rev. P. J. Cummins; architect, C. J. I. Devlin; contractor, Jas. J. O'Brien; signed, Dec. 2; filed, Dec. 5; cost, $4,874.

Stockton near California. Carpenter and mill work; owner, A. E. Davis; architect, John Gash; contractors, McKay & McCann; signed, Jan. 4; filed, Jan. 6; cost, $5,175.

Sullivan and Cum Cook Alleys. Repair three-story brick building; owner, Estate of John Sullivan; architect, F. V. Acker; contractor, A. V. Acker; signed, Dec. 1; filed, Dec. 19; cost, $1,780.

Sunnyside, lot 23, block 47. Factory; owners, Jory Bros.; contractor, Jos. Gabriel; signed, Dec. 31; filed, Dec. 31; cost, $3,635.

Sutter near Jones. Plumbing, gas-fitting, etc.; owner, Emeline Wallace; architect, R. H. White; contractor, Duffy Bros.; signed, Jan. 5; filed, Jan. 11; cost, $7,270.

Sutter and Mason. Brick terra-cotta work; owner, Simeon Wenban; architects, Pissis & Moore; contractor, Union Pressed Brick Terra-Cotta Co.; signed, Dec. 5; filed, Dec. 13; cost, $22,400.

Twelfth Ave. near Clement. One-story cottage and basement; owner, Mary Jane Olwell; architect, C. H. Skidmore; contractor, Adolph Petry; signed, Dec. 12; filed, Dec. 13; cost, $1,530.

Twenty-fourth near Treat Ave. Alterations; owner, Catherine Lynch; architect, Pat'k. F. Lynch; contractor, P. F. Lynch; signed, Dec. 1; filed, Dec. 6; cost, $2,780.

ALAMEDA COUNTY.

Addison near 6th, Oakland. Cottage; owner, Clara Ballard; contractor, Oscar Carpenter; signed, Dec. 16; filed, Dec. 21; cost, $1,000.

Alameda Ave. near Walnut street. Carpenter, plumbing, etc.; owners, J. J. Norman and wife; architect, J. C. Newsom; contractors, Wrampe & Suilflohn; signed, Dec. 16; filed, Dec. 16; cost, $2,225.

Broadway and Fourteenth, Oakland. Erect and furnish elevator; owners, Central Bank of Oakland; architect, W. J. Mathews; contractors, Otis Bros. & Co.; signed, Aug. 20; filed, Dec. 10; cost, $4,250.

Channing Way near Dana, Berkeley. Carpenter and brick work; owner, David W. Loring; architects, Coxhead & Coxhead; contractor, F. W. Kern, signed, Dec. 1; filed, Dec. 2; cost, $6,800.

Encinal, Block 460, Alameda. Cottage and basement; owner, Wm. James; contractors, Marcuse & Remmel; signed, Dec. 19; filed, Dec. 19; cost, $2,000.

Eighth near Madison, Oakland. Brick and carpenter work; owner, Robt. M. Turner; architect, Elmer Childs; contractor, Jas. V. Embury; signed, Dec. 19; filed, Dec. 24; cost, $3,445.

Ellis near Fairview. Bulkheads, carpentering, etc.; owner, Geo. H. Wright; architect, Fred. J. Mauvier; contractor, H. F. H. Brown; filed, Dec. 7; cost, $1,189.

Fifteenth near Broadway, Oakland. Building; owners, Pac. Theological Seminary; architect, Walter J. Mathews; contractor, Herbst & McLeod; signed, Dec. 19; filed, Dec. 22; cost, $7,008.

Fourteenth near Broadway, Oakland. Marble work in Central Bank; owner, Central Bank; architect, W. J. Matthews; contractors, Ruffino & Bianchi; signed, Dec. 16; filed, Dec. 21; cost, $2,000.

Fourteenth near Broadway, Oakland. Lathing, plastering, cement work; owner, Central Bank; architect, W. J. Matthews; contractors, A. C. McTavish, signed, Dec. 12; filed, Dec. 21; cost, $3,240.

Julia near Sherman. Two-story cottage; owner, P. S. Wilson; architects, J. C. & E. A. Mathews; contractors, Pierce & Ruch; signed, Dec. 30; filed, Dec. 31; cost, $1,625.

Milvia Ave. and College Way. Two-story frame; owner, F. B. Gibson; contractor, I. A. Boynton; signed, Dec. 27; filed, Dec. 31; cost, $3,036.

Pacific Ave and Benton. To build; owner, David Clark, Esq.; contractors, Marcuse & Remmel; signed, Dec. 20; filed, Dec. 22; cost, $1,800.

Railroad Ave. near Sherman street. To build; owner, Chas. Moeller; contractors, Marcuse & Remmel; signed, Nov. 29; filed, Dec. 8; cost, $3,000.

Santa Clara Ave. near Seventh. One-story frame dwelling; owner, F. L. Volberg; contractor, A. R. Denke; signed, Dec. 2; filed, Dec. 6; cost, $2,800.

Santa Clara Ave. near Sherman. Cottage; owner, August Bruder, Esq.; contractors, Marcuse & Remmel; signed, Dec. 12; filed, Dec. 22; cost, $1,050.

Searles Track, Berkeley. Two-story building; owner, Mary A. Barracks; architect, John Laughland; contractors, Smith & Keating; signed, Dec 22; filed, Dec. 22; cost, $1,645.

Thirteenth and Broadway, Oakland. Brick work; owner, Pacific Theological Seminary; architect, W. J. Matthews; contractors, Remillard Brick Co., signed, Dec. 24; filed, Dec. 27; cost, $4,755.

Thirty-fifth near Grove, Oakland. Grading, brick work and plumbing; owner, Max Franz; architect, Frederick H. Bomes; contractor, Chas. J. Antivile; signed, Dec. 2; filed, Dec. 3; cost, $1,615.

Washington near 8th, Oakland. Two-story brick; owner, T. H. Corder; architect, C. E. Larsen; contractor, Wm. Winnie; signed, Dec. 14; filed, Dec. 16; cost, $12,085.

Washington and Clay, Oakland. Building and rebuilding wharf; owner, John A. Stanly; contractors, B. McMahon & Son; signed, Dec. 12; filed, Dec. 20; cost, $6,510.

DR. Ellinwood in a lecture delivered on Friday evening, February 10th, in the Cooper Medical College, said the time would come when architects would provide in all large family residences, one or more apartments for the sick, specially provided with hospital conveniences and capable of perfect isolation.

In the December number of the CALIFORNIA ARCHITECT AND BUILDING NEWS, we called attention to the importance of this matter and advocated its introduction.

IN the form of builders' contract now in general use in this city and which was formulated by a Conference Committee of the San Francisco Chapter of the American Institute of Architects, and the Builders' Association, the clause in regard to insurance reads as follows:

"The owner shall not be liable or responsible for any accident, loss or damage happening or occurring to the work specified in the within contract prior to the completion of the same (loss or damage by fire or earthquake excepted)."

Of course the natural inference would be that the owner by this clause would be held responsible for loss in either of the eventualities mentioned. Nevertheless we think the extent of this liability should be fixed in definite terms that will admit of no argument as to their true meaning.

In the form of contract adopted by the American Institute of Architects and the National Association of Builders, published *in extenso* in this number, the insurance clause reads as follows:

"The owner shall during the progress of the work maintain full insurance on said work, in his own name and in the name of the contractor, against loss or damage by fire. The policies shall cover all work incorporated in the building and all materials for the same in or about the premises, and shall be made payable to the parties hereto, as their interest may appear."

We think this latter clause an improvement over the first one, as being more explicit, but might it not cause trouble when the amount of the respective damage sustained came to be determined?

C. Mason Kinne, the insurance claim adjustor, in rendering a decision in a case where he was arbitrator between two companies that had issued policies in favor of the Owner and Contractor respectively, took occasion to recommend the following clause as definitely determining their respective liabilities:

"The owner shall not be liable or responsible for any ac-

cident, loss or damage happening or occurring to the works specified in the within contract prior to the completion and final acceptance of the same, with the exception of loss or damage by fire or earthquake, in which event he shall be liable with the contractor in such proportion as his payments shall bear to the excess value of materials and labor yet unpaid for."

How far one party should be required to protect another's interest, is of course open to discussion, but the justice of requiring both the Owner and the Contractor to protect their respective interests, each one for himself, is evident; this would relieve both parties from liability to the other and avoid all chance of possible disagreement in case of loss by fire.

ANNUAL ADDRESS OF PRESIDENT SANDERS TO THE SAN FRANCISCO CHAPTER OF THE A. I. A.

Gentlemen of the S. F. Chapter of the A. I. A.:

Since you have again bestowed upon me the honor of representing you as president of the chapter, I will recognize your kindness and confidence by a very brief address.

Nevertheless, there are some things to be said at the present time which merit our attention, and I will endeavor to speak of them *seriatim*.

In the first place it will be seen that matters of art are looking up and it behooves the architects to see that their interests are not lost sight of, as they surely will be should we be so shortsighted as to place our light under a bushel. If we would have our interests attended to, it is necessary that we should bestir ourselves and make it evident that we know our place and are prepared to assume it when the opportunity occurs, and moreover, to be ready and instant in making opportunity if it does not otherwise offer. To create an opportunity indeed, consists mainly in creating a necessity and to create an necessity is to make it evident. This wholly depends upon ourselves. We must make it evident to the general public as well as to the directors and officers of the two universities and other educational centers of the Pacific Coast, that architecture is the prime factor and chief conservator, and constitutes the essential element in all the arts of design. Without architecture there would be neither sculpture nor painting properly, so called. There would be no habitations, no civilization, the arts of design would languish and mankind would recede to the condition of the savage or the nomad. Even the engineer would lose his occupation and all the refinements and advanced inventions of the present time would become as objectless and as impossible with us as they would be in the midst of China or the Dark Continent. But to evince this fact with sufficient force, it is necessary for the architect, worthy of the name, to assume and to vindicate by his ability, by his ubiquity, by his genius and by his zeal in the cause of art, and in every department thereof, his fitness to lead, and the necessity for his services, throughout the magnificent domain which lies open to him, to conquer and to win. But to do all this, the architect must, by his indomitable perseverance and unremitting toil and effort, place himself foremost in the conduct and direction of the minutest detail of the innumerable departments into which his work divides itself, and to accomplish this, it is necessary that he should be educated to the requirements of the most exacting of all the occupations of man. He must be a perfect and accomplished engineer, he must know how to handle and direct great materials and great operations. He must know minutely the conditions and qualities of soils and materials, he must be thoroughly familiar with the resolution of forests and the chemical affinities of almost every known substance. He must be prepared to confine the unconfinable and render practically immovable the even shifting and disintegrating substances of the material universe so far as his work renders it necessary. *More*, he must be thoroughly familiar with nature in all her moods and tenses, and to be prepared to modify her aspects and command her resources, and so adapt means to ends, as out of the commonest materials to mould each form so that it shall thenceforth become "a thing of beauty and a joy forever!" For be this remembered, no impression of the sublime, the beautiful, or the true, when once impressed on the imperishable tablets of the mind of an individual or a multitude, can never be obliterated in its influences to the latest æons of eternity! Let each student of our sublime art well consider this fact, take it home to himself and prepare himself accordingly if he hopes ever to produce works of permanence or beauty. Also, that ugliness or unsightliness is only less prejudicial and only less permanent than the beautiful and true, and that if he would avoid the one and attain the other, it will only be by storing his mind with proper materials and cultivating the faculties by which he has been endowed, by a careful use of them throughout his life, that he can ever expect to accomplish his mighty task.

But more still, after the architectural student has laid in a large store of technical knowledge, after he has familiarized himself with the beautiful in every form, by means of the abundant elements evolved in previous ages so ready to his hand; and after he has trained his eye to see and his heart to feel the eloquent sentences his mind has learned to formulate and his genius to realize; he must then begin to acquaint himself with the peculiarities and the exigencies of every other art. He must know art in every protean form in which it has been developed in our protean age. He must be in effect a painter, a sculptor, a musician and an orator. He must be acquainted with history in all its ramifications and a theologian, as knowing the tenets and therefore the religious practice of the religionists of every age. He must be familiar with the politics of his time, and past times, as well as a poet, a philosopher, and a mathematician, so that in all the innumerable connections, interrelations of this world of life, he may aid in the regulation and conduce to the perfection of the design of the tapel, which shall fix in glorious color and in lovely forms the wondrous tapestry of our present, as well as the future, of our civilization.

But for ourselves, my brothers in the glorious art of design, is there nothing we can do by act as well as words, to give force to our advice to our young friends the students? At least, while we are in the thick of battle and of fray; down in the actual drudgery, as well as up on the higher levels of our art on which we may have occasion to stray, may we not bear in mind, that by persisting in keeping foremost the ideas of architectural supremacy in our minds, we will be more and more incited to excellence and permanence in all we do, and more exacting and critical in the perfection, beauty and completeness of our designs? And by tentative jealousy of supreme control in the works in which we find ourselves engaged, may we not aid in the accomplishment of what seems to be the chief object of attainment at the present time is the placing of the genius of architecture in the central, if not necessarily the highest place, amongst the arts of design?

In view of the architectural display embodied in the structures of the Columbian Exposition—disappointing as they are in some respects, as an exemplification of the development of architectural taste on new lines in America, still it cannot be doubted, that in the realization of these buildings, good taste and a certain degree of appropriateness has been attained, even if they do not fall short of the ideal, in almost every instance, of what it would seem should constitute, in the closing years of the Nineteenth Century, a perfect Exhibition Building.

DESIGN FOR A CHURCH TOWER.

In regard to what we believe should constitute an architectural exhibition (unless the whole scope and object of the above mentioned exhibition may be considered to fulfil in the best possible way, that idea) it is probable that there will be also cause for disappointment, in view of what might have been accomplished had the proper intention and meaning of such an Exhibition been sooner developed. But we must be content with what the Gods send us in that regard, and there will be ample time to develop the idea to its broadest extent, before the universal Exhibition of the World's industries and arts is held in San Francisco, shall we not say in the semi-Centenial or Jubilee year of its foundation?

In regard to the conduct and administration of the affairs of the San Francisco Chapter of the A. I. A., there is much still to be desired, much to regret, and much to be hoped for. In the first place, the President feels it obligatory on himself to lay upon each of the executive officers, the burden of producing an essay at each of the quarterly Saturday afternoon lunches and exhibitions of student's drawings, which the work of the year will make it necessary to convene.

If some one or other of our older members, such as William Patton, Esq., Henry Kenitzer, Sr., or Mr. David Farquharson, a former member, or some other architect, who has ceased the active practice of his profession, could be induced to prepare and deliver at such a meeting as is above indicated, a paper on some subject agreeable to themselves, viewing professional subjects from their present standpoints, we believe that much would be done to keep alive the "Armor Propre" of the Cult, and bring us up with a round turn in some of the vagaries we are apt to fall into, without the restraint which such conservative influence is apt to exercise. It would not be inappropriate to make our student members, guests on such occasions, that they may be edified by the super-abundance of what superfluous wisdom which is apt to flow around.

Claiming and confidently expecting the zealous assistance during the year, of the officers and members of the Chapter, and trusting and hoping for a large increase of new blood, without which we cannot grow, I beg to subscribe myself,

Your Humble Servant,

The President.

The Californian suggest that the Mount Vernon estate, or what is left of it, be converted into a site for the American Valhalla.

It is true we have no national resting place for our distinguished men; no Westminister Abbey to commemorate the glory, and perpetuate the fame of our heroes; yet whether the institution of such posthusmous distinctions would be quite in keeping with the ideas of the framers of the American Constitution is open to question; on the other hand the associations that would cling to so hallowed a spot, would engender an honest pride in the achievements of our fellow countrymen, and foster those feelings of patriotism, so necessary to our preservation as a nation.—*Ed.*

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.

GEO. H. SANDERS, Pres. W. J. CUTHBERTSON, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Tres.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.

JOHN RICHARDS, Pres. L. WAGONER, Vice-Pres.
OTTO VON GELDERN, Sec. *GEO. F. SCHILD, Treas.

THE regular meeting of the Chapter was held on the 20th ult., too late for us to report its proceedings in the January number of the CALIFORNIA ARCHITECT.

The Chapter awarded first mention in the competition for a Country Chapel (drawings for which were submitted by the students in the Architectural Class at a previous meeting) to Mr. Meussdorffer.

The work of the modeling class received high praise from the members present, and Mr. de Prosse, its instructor, was given a vote of thanks for his services

In connection with this subject of the Chapter Classes it was resolved to apply to the Board of Regents of the University of California, for space in the Mark Hopkins' Institute of Art.

It was the general opinion that much good would result both to the profession and to the public appreciation of its practical work, if a more general interest in and sympathy with its aims, could be aroused in the people, no class, from the highest to the lowest, but what is continually, both in business hours and home leisure, enjoying the benefits of the architects' foresight, or experiencing the inconvenience caused by the employment of ignorant and incompetent pretenders.

This latter evil was discussed at some length, and it was decided to attempt to give the public the means of judging in a small measure at least, whether the architects they employed had had reasonable experience in the practice of their profession before soliciting or obtaining employment from the general public by the introduction of a bill before the Legislature of which the following is the principal point:

Resolved to present to the Legislature the draft of a bill making it compulsory for every practicing architect to register his name with the Controller of the State before advertising or practicing the profession of Architecture; that the requirements entitling the architect to register shall be five years' previous practice of the profession, or five years' service as student in the office of a registered architect.

Violation of the provision of the law to be considered a misdemeanor, punishable the same as other misdemeanors.

Upon invitation of President Sanders, Mr. Alfred Colin read the following paper on the course of study that should be pursued by the Architectural Students after leaving the public schools:

Mr. Chairman, Gentlemen:

Animated with the same liberal spirit of progress as several Chapters of the Institute of American Architects, you study the advisability of establishing Art classes for the younger members of the profession. These classes must gradually raise the standard of required knowledge of the practitioners.

Many colleges and universities have courses in Architecture, requiring the presence of their students during four years. It is an open question to know if more may be achieved during this period. But a university lacks that atmosphere of art which is required for an architect's training and only to be found in great centres of population. There are also institutes, night schools, drawing schools, etc., all are equally insufficient. This brings us to study what may be accomplished in the city of San Francisco.

We shall assume that quarters are provided in the Mark Hopkins' Institute of Art, and that instruction is given day and evening.

THE DAY CLASSES

would be the more thorough as more time would be spent by the student, who, later, might finish his course in the evening classes.

Let us then sketch a course of instruction which might cover two years.

For admission it does not seem expedient to take youths

HALL OF RECORDS, QUINCY, PLUMAS COUNTY, CAL.

before fifteen years of age; candidates ought to pass a satisfactory examination in Arithmetic, Algebra, English and Free-hand drawing. Candidates who would previously have worked in a carpenter shop would have a manifest advantage.

The course of instruction would be

FIRST YEAR:

Geometry, Algebra, Trigonometry,	5 hours weekly.
English Language, General History,	5 "
Free-hand Drawing, Clay modeling, Instrumental drawing	18 hours weekly.

SECOND YEAR:

Mechanics, Descriptive Geometry, Perspective, Surveying, Construction	5 hours weekly.
English Language, History of Art	5 "
Free-hand drawing, Instrumental drawing and Water Color	18 hours weekly.

English language does not mean grammar and rhetoric, but an aptitude to write reports and to read well in public.

By Free-hand drawing must be understood: geometrical solids, ornament, heads, landscape, flowers, animals, sketching, pen and ink, etc.

Instrumental drawing would be introduced late in the first year, because the whole secret of drawing rests with free-hand.

Descriptive Geometry and Perspective, afford excellent practice in construction, which gives confidence to the student who is too inexperienced to undertake problems of Architectural design.

THE EVENING CLASSES

ought to cover in the beginning the same subject matter as the day classes, but with the understanding that this teaching be eliminated as soon as possible, for the course consists of.

Properties and strength of materials, Construction.

Heating, ventilating, hygiene, sanitary engineering.

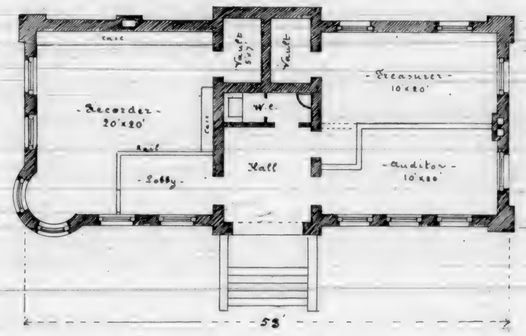
History and composition of ornament.

Theory of Architecture.

Drawing except for competitive examination and composition ought not to be a part of evening classes, as the students are supposed to practice it during day-time in offices.

The evening course would necessitate three years.

It is easily seen that this course leaves out many important branches of knowledge—Physics, Chemistry, Geology, Legislation, etc., but improvements will come with time.



The aim must be to teach as much as possible *drawing* in all its applications and *decorative arts.*

Architecture is the supreme art, but sculpture ought not to be omitted and if *ateliers* were provided, all the crafts of the artist-artizans who contribute to make the house beautiful ought to be represented, such as cabinet makers, wood carvers, decorators, metal workers, etc.

The above scheme is of necessity somewhat vague, no shop work is introduced as the building where the school is to be located is not appropriate to this end; technical or manual schools already exist, or will soon come into existence so that receiving students from them, a more elaborate preparation would be expected of such. Presently the only question is to know *what students* and what *kind* of students may be obtained? However it will take but a very short time to see such a school prosperous as the Art Schools of the Metropolitan Museum of Art in New York, in the organization of which I had the honor of being called to co-operate. ALFRED COLIN.

San Francisco, January 20, 1893.

Mr. Gash had also been reflecting on the subject of Education, and read to the meeting the first chapters of a Catechism of Architecture which he proposed to write

THE February meeting of the Chapter was held on the 10th. A communication was received from the Secretary of the Institute, requesting the Chapter to render such assistance as might be possible to forward the passage of House Bill No. 9592, authorizing the Secretary of the Treasury to obtain plans and specifications for public buildings by competition.

A letter from the Architectural Association of Southern California was received, with a set of resolutions passed by that body in favor of the same bill. Action to that same end was taken by the Chapter, and it is hoped the bill may be passed before the adjournment of Congress.

AN ACT REGULATING THE PRACTICE OF ARCHITECTURE IN THE STATE OF CALIFORNIA.

RECOMMENDED BY THE SAN FRANCISCO CHAPTER A. I. A. AND INTRODUCED BY THE HON. JOHN M. CURTIS, JANUARY 30, 1893.

WHEREAS, The profession of architecture is one that under our present civilization has grown to be a necessity, and there are a great number following the profession who are incompetent by reason of their having no knowledge thereof, which knowledge can be gained only by proper training; and whereas, there is danger to life and property in our State by reason of earthquakes, by fire, and, in some cases, of the actual destruction by settling of buildings, etc., the cause being credited to the ignorance and incompetency, and possibly, in some cases, to the want of practical experience, and dishonesty of persons following the profession; therefore,

THE PEOPLE OF THE STATE OF CALIFORNIA, REPRESENTED IN SENATE AND ASSEMBLY,

DO ENACT AS FOLLOWS:

SECTION 1. It shall be unlawful for any person, after the passage of this Act, to engage in the practice and profession of architecture who has not served an apprenticeship of five years to a registered architect of the State of California, and who holds a properly authenticated indenture from the same, and said indenture shall entitle him to register with the Controller of State as hereinafter provided.

SEC. 2. It shall be unlawful for any person at present engaged in the practice of the profession of architecture in this State, to follow or practice the said profession unless that, within ninety days from and after the passage of this Act, he shall register as hereinafter provided; and no public buildings shall be erected without the services of a registered architect.

SEC. 3. Architects coming to this State from other States, countries, or places shall, before practicing their profession in this State, file satisfactory evidence with the State Controller for this State, that they have served a regular apprenticeship to their profession of at least five years, or shall have practiced their profession five years in the place from whence they came, or in this State.

SEC. 4. Upon the registering of any person authorized under this Act to register, the State Controller shall issue to him a certificate, certifying that he is a registered architect and entitled to follow the profession of architecture in this State, for which certificate he shall be entitled to charge a fee not exceeding ten dollars.

SEC. 5. Any person following or practicing the business or profession of architecture, or in any way advertising himself as an architect in this State, in violation of this Act, is guilty of a misdemeanor, and punishable as provided for other misdemeanors. This Act to take effect and be in force immediately upon (after) its passage

PROPOSED AMENDMENT TO THE EXISTING LIEN LAW.

HON. J. M. Curtis has introduced a bill modifying, the present lien law in several important particulars which are briefly described below:

The time for filing liens (except those of original contractors) has been reduced from thirty days to ten days.

The occupation or use of any building improvement, or structure, in whole or in part, by the owner, his representative or tenant shall (save in cases of alterations, additions or repairs) be deemed conclusive evidence of completion.

Cessation of labor for thirty days shall be deemed equivalent to completion.

Except in the cases above mentioned, a certificate of completion shall be filed for record within five days from and after completion.

The term "original contractor" is more definitely defined, and a new section to be numbered 1203, provides for a bond amounting to twenty-five per cent of the contract price, which bond shall insure to the benefit of any and all persons who perform labor for, or furnish materials to the Contractor; failure to comply rendering the owner and contractor jointly liable for the debts incurred.

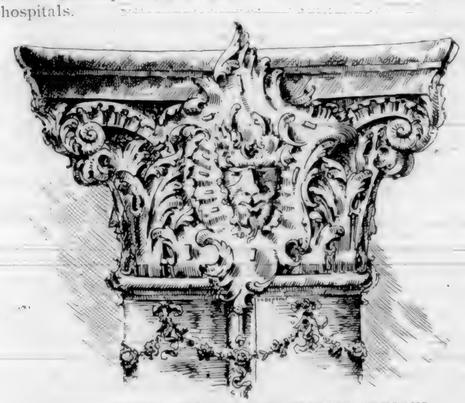
YELLOW PINE AND CALIFORNIA BUILDING LUMBER.

IN early times in California, when the saw-mill business was not reduced to such a science as it is now, many mill-owners placed their plants in the foot-hills. They cut everything that came along, without regard to quality or usefulness. In these foot-hill districts the timber is of an inferior grade, spongy and liable to twist and split if exposed to the elements, and because of the many disadvantages of this lumber it has been given the name, Bull-Pine, a name which suggests the true nature of the wood.

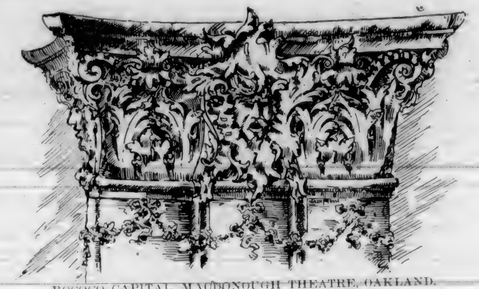
All lumber from the foot-hills is of a similar character to Bull-Pine and is consequently condemned by our architects and builders. Of all pines, Sugar Pine is the most favored and even that, when taken from the lower districts, is of an inferior grade.

During the past fifteen or twenty years the mills have had to go back or higher into the mountains and the temperature, winds and snow, exercise such an influence upon the timber that the mills of a higher altitude are able to produce a pine superior to any of the eastern woods. Yellow Pine, grown in the northern California mountains, is as firm and durable as any of the pines grown in the eastern part of the United States.

For standing finish, flooring, stepping, etc., and places where durability and strength are required it has no superior among the soft woods. Another point in favor of it is its tendency to become light in color with age, while Oregon Pine becomes darker under the same circumstances. The germs of disease cannot get such a hold on Yellow Pine as they can in Redwood, White Cedar, etc., and the delicate pitchy odor peculiar to Yellow Pine, makes it its own disinfectant and especially adapted to use in living rooms and hospitals.



ROCOCO CAPITAL, MACDONOUGH THEATRE, OAKLAND.



ROCOCO CAPITAL, MACDONOUGH THEATRE, OAKLAND.

I will venture to say from my own personal observations, during the past twenty-five years, that slash grain, No 2., Yellow Pine flooring, will outlast the vertical grain in Oregon Pine or Fir, for the reason that it wears smooth and does not sliver, while in vertical grain Oregon Pine, the soft fiber between the hard grain shrinks away and causes the piece to become rough and full of splinters. Scrubbing has no rotting effect but will make it whiter, while an Oregon Pine floor *will rot* under an ordinary amount of scrubbing. While it is true that Yellow Pine costs a trifle more than Oregon Pine, the benefits are increased four fold.

If you will but notice the percentage of Yellow Sugar Pine used in steamboat work, it will furnish convincing proof of the value of it for rough work and its ability to hold paint in spite of the many immersions in salt water.

A few words more in regard to our California woods, we have what is called Oregon Pine or Red Fir and White Fir or Spruce. Our mountain Red Fir is better than Oregon or Fir Pine for railroad bridges and seems an excellent lumber for holding its shape, strength, etc. I mention these facts for the benefit of those who think we produce nothing but Redwood and Sugar Pine.

Much more could be said in regard to our woods in general but my humble pen is not equal to the task of what is known by our Californian lumbermen in regard to a product that will some day form a great factor in our commerce and bring California among the first ranks of lumber producing states.

I feel confident that I have not done full justice to my subject but will reserve for a future article.

Tam Sirrah.

ILLUSTRATIONS

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

THE Roman Catholic Theological Seminary designed by Architect Chas. J. I. Devlin, is to be erected at Menlo Park.

J. Cather Newsom contributes the perspective view of a residence at San Jose, and Percy & Hamilton, one erected in this city.

THE design for a Country Chapel is one submitted in competition by Mr. C. Meussdorffer, and shows the proficiency attained by Architectural students in the class taught by President Sanders.

THE STANDARD CONTRACT FORM.

THE following is the text of the form of Builders' Contract adopted and recommended for general use by the American Institute of Architects and the National Association of Builders, as revised by the joint committee, January 10, 1893, and published by the Inland Publishing Company, the licensee for exclusive publication:

This Agreement, made the.....day of..... in the year one thousand eight hundred and ninety..... by and between..... .....party of the first part (hereinafter designated the Contractor), and..... .....party of the second part (hereinafter designated the Owner),

Witnesseth that the Contractor, in consideration of the fulfillment of the agreements herein made by the Owner, agrees with the said Owner, as follows:

ARTICLE I. The Contractor, under the direction and to the satisfaction of..... Architects, acting for the purposes of this contract as agents of the said Owner, shall and will provide all the materials and perform all the work mentioned in the specifications and shown on the drawings prepared by the said Architects for the..... ..... which drawings and specifications are identified by the signatures of the parties hereto.

ART. II. The Architects shall furnish to the Contractor, such further drawings or explanations as may be necessary to detail and illustrate the work to be done, and the Contractor shall conform to the same as part of this contract so far as they may be consistent with the original drawings and specifications referred to and identified, as provided in Art. I.

It is mutually understood and agreed that all drawings and specifications are and remain the property of the Architects.

ART. III. No alterations shall be made in the work shown or described by the drawings and specifications, except upon a written order of the Architects, and when so made, the value of the work added or omitted shall be computed by the Architects, and the amount so ascertained shall be added to or deducted from the contract price. In the case of dissent from such award by either party hereto, the valuation of the work added or omitted shall be referred to three (3) disinterested Arbitrators, one to be appointed by each of the parties to this contract, and the third by the two thus chosen; the decision of any two of whom shall be final and binding, and each of the parties hereto shall pay one-half of the expenses of such reference.

ART. IV. The Contractor shall provide sufficient, safe and proper facilities at all times for the inspection of the work by the Architects or their authorized representatives. He shall, within twenty-four hours after receiving written notice from the Architects to that effect, proceed to remove from the grounds or buildings all materials condemned by them, whether worked or unworked, and to take down all portions of the work which the Architects shall by like written notice condemn as unsound or improper, or as in any way failing to conform to the drawings and specifications.

ART. V. Should the Contractor at any time refuse or neglect to supply a sufficiency of properly skilled workmen, or of materials of the proper quality, or fail in any respect to prosecute the work with promptness and diligence, or fail in the performance of any of the agreements herein contained, such refusal, neglect or failure being certified by the Architects, the Owner shall be at liberty, after.....day's written notice to the Contractor, to provide any such labor or materials, and to deduct the cost thereof from any money then due or thereafter to become due to the Contractor under this contract; and if the Architects shall certify that such refusal, neglect or failure is sufficient ground for such action, the Owner shall also be at liberty to terminate the employment of the Contractor for the said work and to enter upon the premises and take possession, for the purpose of completing the work comprehended under this contract, of all materials, tools and appliances thereon, and to employ any other person or persons to finish the work, and to provide the materials therefor; and in case of such discontinuance of the employment of the Contractor he shall not be entitled to receive any further payment under this contract until the said work shall be wholly finished, at which time, if the unpaid balance of the amount to be paid under this contract shall exceed the expense incurred by the Owner in finishing the work, such excess shall be paid by the Owner to the Contractor, but if such expense shall exceed such unpaid balance, the Contractor shall pay the difference to the Owner. The expense incurred by the Owner as herein provided, either for furnishing materials or for finishing the work, and any damage incurred through such default, shall be audited and certified by the Architects, whose certificate thereof shall be conclusive upon the parties.

ART. VI. The Contractor shall complete the several portions, and the whole of the work comprehended in this Agreement by and at the time or times hereinafter stated ....provided that..... .....

ART. VII. Should the Contractor be obstructed or delayed in the prosecution or completion of his work by the act, neglect, delay or default of the Owner, or the Architects, or of any other Contractor employed by the Owner upon the work, or by any damage which may happen by fire, lightning, earthquake or cyclone, or by the abandonment of the work by the employees through no default of the Contractor, then the time herein fixed for the completion of the work shall be extended for a period equivalent to the time lost by reason of any or all of the causes aforesaid; but no such allowance shall be made unless a claim therefor is presented in writing to the Architects within twenty-four hours of the occurrence of such delay. The duration of such extension shall be certified to by the Architects, but appeal from their decision may be made to arbitration, as provided in Art. III of this contract.

ART. VIII. The owner agrees to provide all labor and materials not included in this contract in such manner as not to delay the material progress of the work, and in the event of failure so to do, thereby causing loss to the Contractor, agrees that he will reimburse the Contractor for such loss; and the Contractor agrees that if he shall delay the material progress of the work so as to cause any damage for which the Owner shall become liable (as above stated), then he shall make good to the Owner any such damage. The amount of such loss or damage to either party hereto shall, in every case, be fixed and determined by the Architects or by arbitration, as provided in Art. III of this contract.

ART. IX. It is hereby mutually agreed between the parties hereto that the sum to be paid by the Owner to the Contractor for said work and materials shall be $..... ..... subject to additions and deductions as hereinbefore provided, and that such sum shall be paid in current funds by the Owner to the Contractor in installments, as follows: ....

The final payment shall be made within.....days after this contract is fulfilled.

All payments shall be made upon written certificates of the Architects to the effect that such payments have become due.

If at any time there shall be evidence of any lien or claim for which, if established, the Owner or the said premises might become liable, and which is chargeable to the Contractor, the Owner shall have the right to retain out of any payment then due or thereafter to become due an amount sufficient to completely indemnify him against such lien or claim. Should there prove to be any such claim after all payments are made, the Contractor shall refund to the Owner all moneys that the latter may be compelled to pay in discharging any lien on said premises made obligatory in consequence of the Contractor's default.

ART. X. It is further mutually agreed between the parties hereto that no certificate given or payment made under this contract, except the final certificate or final payment, shall be conclusive evidence of the performance of

this contract, either wholly or in part, and that no payment shall be construed to be an acceptance of defective work or improper materials.

Art. XI. The Owner shall during the progress of the work maintain full insurance on said work, in his own name and in the name of the Contractor, against loss or damage by fire. The policies shall cover all work incorporated in the building, and all materials for the same in or about the premises, and shall be made payable to the parties hereto, as their interest may appear.

.....

Art. XII. The said parties for themselves, their heirs, executors, administrators and assigns, do hereby agree to the full performance of the covenants herein contained.

In Witness Whereof, the parties to these presents have hereunto set their hands and seals, the day and year first above written.

In presence of .....[SEAL]

ELEVATION OF $1,500 COTTAGE.

EFFECT OF TURPENTINE GATHERING ON PINE TIMBER.

THE Forestry Division of the United States Department of Agriculture in a circular published about a year ago, stated that tests made on timbers of Longleaf Pine, bled or unbled, lent countenance to the belief that bled or tapped timber did not suffer in strength by virtue of the tapping. Further tests and examinations now permit the announcement without reserve, *that the timber of Longleaf Pine is in no way* affected by the tapping for turpentine. This refers to its mechanical as well as chemical properties, and hence even the reservation that it might suffer in durability is now eliminated and any prejudice against the use of bled timber in construction, wherever the unbled timber has been considered desirable, must fall as having no foundation, in fact, being based only on vague belief, proved to be erroneous.

It is to be hoped that this fact will be made widely known among builders, architects and engineers who have hitherto made discrimination against bled timber and thereby depreciated or discouraged the manufacture and impeded the sale of an article which answers all the purposes of construction and the unrestricted use of which is dictated by true economy.

The basis for the statement regarding the mechanical properties is furnished by a series of tests comprising not less than 300 tests on 32 trees of this Pine, bled and unbled, from various localities.

The somewhat puzzling fact that bled timber exhibited, if any thing, greater strength in the tests has been accounted for by the fact that the turpentine orchards are located mostly on sites which produce better quality timber as well as larger yield of turpentine.

To determine whether any changes in the chemical composition take place, a series of chemical analyses of bled and unbled timber has been made, which indicates that the resinous contents of the heartwood are in no wise affected by the bleeding, the oleoresins of the heartwood being non-fluid, the whole turpentine flow is confined to the sapwood.

Among other interesting facts regarding the distribution of resinous contents through the tree which will be published in a separate bulletin, it appears that trees standing side by side and to all appearances in similar conditions show very varying quantities of resinous contents.

To make sure that experience did not, if sifted down, contradict the results of these investigations, a competent agent, Mr. F. Roth, visited turpentine orchards and sawmills in the Longleaf Pine region. He reports that nobody was found—although it was claimed by some—able to discern any difference in the appearance of the bled and unbled timber; that in spite of consumers' specifications for unbled timber, they are almost invariably served with a mixture without finding it out; that experience in the districts where bled timber is cut and used has not sustained the claim of inferiority.

NOTES & COMMENTS.

Mr. Frank T. Shay of the well-known firm of Shay & Shay, Architects, has been appointed City Hall Architect.

The caves of Burmah are rich in wooden carvings, glazed tiles and images as well as tablets in terra-cotta, marble, alabaster and other materials. These relics illustrate the ancient and modern phases of Buddhist worship.

It is proposed to lay a pipe over the East River bridge, to connect the post-office of New York and Brooklyn. In this tube is to be an electric railway, with cylindrical cars, large enough to enclose a mail pouch, and run by a small motor taking the current by means of a trolley. An estimated speed of one hundred miles an hour is to be obtained.

The *Revue de Chimie Industrielle* says that in order to convert blue prints into black prints the prints should be first passed through water acidulated with nitric acid, and thence into—

Carbonate of Soda	50 grammes.
Water	1 liter.

In this the picture is changed to an orange tone, when it is removed and placed in—

Gallic acid	50 grammes.
Water	1 liter.

Being subsequently washed in water acidulated with HCl.

I first had my attention, said W. D. Howells in *The Californian*, called to socialism as an active force in modern life by President Hayes, who referred to our national post-office as an example of practical socialism, adopted into the old Jeffersonian system of government; and then I began studying its out croppings here and elsewhere. The more I have studied it the more I am convinced of the inherent soundness of its doctrines; and the more I study our people as a whole, I am satisfied that it is the political necessity of the near future.

BOOKS & PERIODICALS

THE CHICAGO ARCHITECTURAL SKETCH CLUB courteously sent us an artistically bound volume illustrating in line and half tone, drawings and sketches by members of the club. The book is well worthy of a place on the table of any architect or draftsman in the land; the drawings are the result of work done at odd moments after working hours by members of the club, which was organized by a few draftsmen in 1885, and has been very successful.

STONE for February contains the first of a series of profusely illustrated articles on the Chateaus of France, by Louis H. Gibson, architect. Also an illustrated article on the Penrhyn slate quarries and the sandstone interests of Northern Ohio. Two pages are given to illustrations of elaborate stone entrances, and an excellent frontispiece of a stone arch bridge adorns this number.

A MANUAL OF INDUSTRIAL DRAWING for carpenters and other wood workers, by W. F. Decker, is a book of practical directions and instructions to enable mechanics to make clear and intelligable drawings that may be understood without difficulty by any workman. For sale by Wm. T. Comstock, 23 Warren street, New York, price $1.50 by mail postpaid.

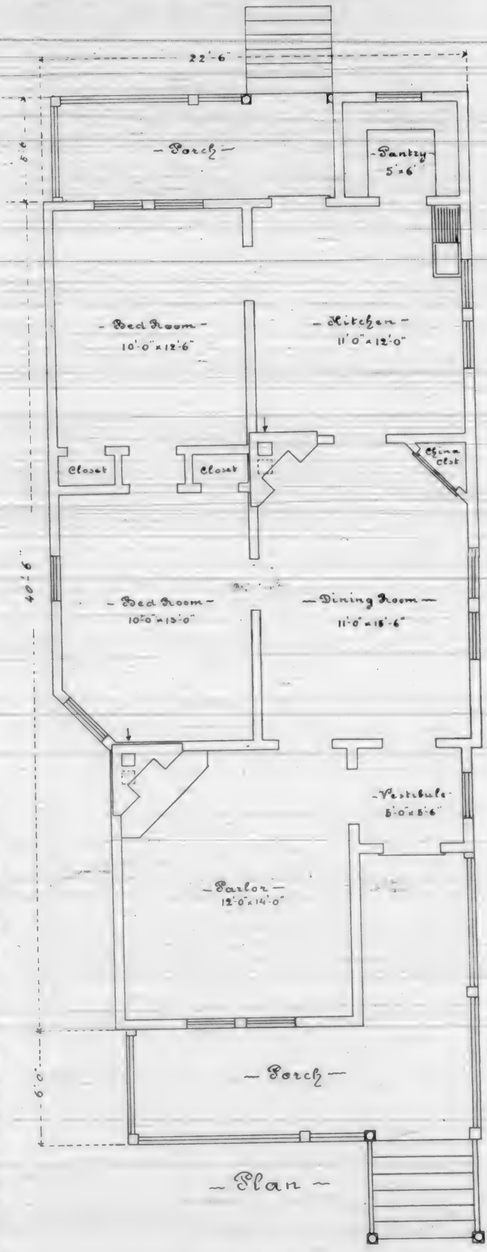
ELECTRIC LIGHTING SPECIFICATIONS for the use of Engineers and Architects, by E. A. Merrill, are intended as outlines to aid in the construction of specifications for individual installations, the details of which would have to be elaborated to meet the requirements of the conditions under which the installation is to be employed.

In the book are the rules and regulations of the National Electric Light Association, the National Board of Fire Underwriters and the New England Insurance Exchange, given in full. For sale by Osborne & Alexander, price $1.00.

The Engineering Magazine, for February, contains among other articles of interest to Architects and Engineers, one entitled "Fire Losses in Fire Proof Buildings," by Charles Bebb.

The writer takes for his text the burning of the Athletic Club building in Chicago—want of space prevents making extended extracts; but the following will prove of interest to both Architects, Insurance Companies as well as those who have in contemplation the building of this class of "Sky Scrapers:"

The result of this great fire demonstrates two great facts. The first is that laws governing the fire-proofing of high buildings do not begin to be efficient, and will not be until the possibility—to owner and architect alike—of using unnecessary combustible material is absolutely precluded, the term "unnecessary" being practically and specifically defined. The other fact is the superiority of the material used for fireproofing in this particular building. This matter deserves very careful consideration, for we have two elements diametrically opposed which cannot be considered apart in any fire, great or small. What we require is the material that will best resist the combined action of *fire* and *water*. The first actual data upon this subject fortunately was given in a widely-read architectural periodical, the *American Architect and Building News* of March 28, 1891. The paper referred to, gave a detailed account of comparative tests of different fire-proof materials made at Denver, Colorado, at the time the award was made for fireproofing the Equitable building in that city. The result demonstrated the unqualified superiority of porous terra-cotta. While the results obtained then may have been regarded as still problematical, this recent fire has been a practical test of their accuracy beyond question.



PLAN OF $1,500 COTTAGE.

A "TALL" STORY.

A section of one of the "big trees" of California, the "General Logan," is now on its way to the World's Fair at Chicago, having been successfully brought down the mountain from its home in the forest, near Fresno, to the railway station at Monson. In order to get it down the mountain it was found necessary to cut it into forty-five pieces, each piece being 14 ft. long, the whole forty-five pieces tipping the scale at 270,000 lbs., and requiring ten flat cars to carry it on the railway. Other sections of trees will be on exhibition at Chicago, but the "General Logan" beats them all. For many years this great tree has been the cause of numerous quarrels between the inhabitants of Fresno and Tulare counties; each claimed it, and each backed up the claim with "Winchesters." At last, to put an end to the senseless waste of good powder and good citizens, a special survey was ordered by the State, and the tree found to be within Fresno county. The foregoing paragraph is not from an American paper; it comes from the London *Daily Chronicle*.

THE PIPING OF DWELLINGS.

THE leakage of water pipes behind decorated walls and in fine ceilings is a sufficient argument against casing or covering service pipes. The repairs are generally costly in themselves, and they entail the additional services of the carpenter and decorator, as well as those of the plumber. Pipes in casings, or set in walls or partitions as they pass from floor to floor, provide especially inviting runways for mice, rats and vermin of all kinds. Nests are built in these places; scraps of paper, rags and food are carried into them, and they become filthy. It is only necessary to remove a covering board from almost any casing to prove this point in a most convincing manner. Even those in comparatively new buildings will be found surprisingly foul.

These casings, or wall pockets, as the case may be, serve another and usually unexpected purpose. They act as ventilators and distribute odors from the kitchen and cellar to all parts of the building. In the performance of this duty they are faithful and impartial.

Pipes carried openly through a building are not dangerous, because their condition can be constantly observed. If accidents occur the point at which the break takes place can be reached at once and repairs easily made. The quality of the work gains materially, because the plumber takes pride in putting up work which is to be exposed. He has natural and very justifiable pride in having the workmanship creditable to himself. This pride is increased by certain traditions of the trade, and there is a double gain to owner and occupant.

Exposed pipes may be made to pass through floors without leaving an opening. The floor around the pipe can be made perfectly tight and the passage of odors cut off completely—at least, as perfectly as the nature of the plaster will permit. This is an enormous gain, while the runways for rats and mice, roaches and water-bugs, are entirely done away with. These vermin can then be exterminated. This is practically an impossibility in houses where casings protect them and afford perfect breeding places. Cut off from free passages to all parts of the house, they prefer more congenial quarters, where rapid transit and fields for colonization are provided.

As decorative features of the rooms cast pipes, at least, are often treated in a beautiful way. The body of the pipe is colored a very dark bluish gray, scarcely removed from black. The bands are silver or nickel bronzed, or have silver or nickel leaf applied to them. Occasionally the whole pipe is finished with two or three shades of bronze. Lead and wrought-iron pipe receive somewhat similar treatment. The lead is often polished and varnished. There is, however, no difficulty in making the decoration of the pipes strikingly effective.

It is satisfactory to know that architects and builders are beginning to break away from the old custom and expose their pipes wherever the prejudices of the owners can be overcome. Some of the best men in the profession are treating the plumbing work in a manner to show constructively its importance and value. The result is a great gain to both owner and occupant.—*Mechanical News.*

STREET NAMES AND HOUSE NUMBERS.

ONE great source of annoyance in American cities is the neglect by those in authority to put up the various street names in a manner and in places clearly visible at all times, and the neglect by private individuals to number their houses properly. In most of our large cities street names are supposedly to be found on the lanterns at street crossings. These lanterns are not always all that could be desired, and it will almost invariably be discovered upon examination that the street name is spelled out in letters several sizes too small and miserably executed with a stencil, while the lantern the sign is affixed or clings to, is looking forward with a hope well-nigh heroic to a coming washday in the dim future. To some extent the same criticisms apply to the manner of putting up house numbers. Often the house has no number on it at all, then again the figures are so small that they cannot be readily discerned, or they are placed in a position where no one can see them at night. The sight of a person walking along the sidewalk gazing searchingly at one house front after another, while going through a mental calculation whether or not this might not be the right house after all, is familiar to everyone

There is ample opportunity for the display of taste and art in the proper numbering of houses, and in affixing street names. There is no reason whatever why street names should not be sandblasted upon street lanterns in large letters, and why an unmistakable sign with the street name should not be made an ornamental feature of houses situated on the corner of a block. Wrought iron grilles, over well illuminated transoms, with figures large enough to be clearly distinguishable across the street, look a great deal better and are more serviceable also than the little numbers so frequently used that can only be read by climbing up the front door steps. To say that larger numbers are in bad taste is to say that it is also bad taste to offer to friends, callers, strangers and everyone a very much needed convenience.

The idea of proper street names and house numbers as indicated, is neither ideal nor new, the most out of the way village of the German Tyrol, inaccessible by rail or by stage, is better provided with facilities in this respect than our most enterprising and prosperous American cities, and to say the least, it is queer and strangely illogical that a people that takes letters and numbers to stand in the stead of other street names because it considers it a matter of convenience, should so hopelessly fail to placard this same invention properly.—*The Trefoil.*

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

THE LAW OF LIEN.—To enforce an asserted lien under the mechanics' lien law, the Supreme Court of California laid down the following new principle of importance to builders and contractors:

The question presented was not whether a lien for work or materials can be assigned or would pass under an assignment of the debt secured, but whether a laborer or a material man can assign his mere right to assert and create a lien by complying with statutory provisions and clothe the assignee with the power to create the lien for himself, and we are satisfied that he cannot.

J. S. Mills v. La Verne Land Company, Supreme Court of California.

THE RIGHTS AND RISKS OF ENTERING ON ANOTHER'S PREMISES TO SAVE THEM.—A license to enter upon the land and premises of another is not always based on the permission of the owner; it is sometimes given by the law. An instance is where a fire breaks out in a city. Here the public authorities, and even private individuals, may enter upon adjacent premises, as they may find it necessary or convenient in their efforts to extinguish or to arrest the spread of the flames. In such case, though they have no express permission from the owner or any other person, they have an implied license by law to enter on the premises to save the property. It is a very ancient rule of the common law that an entry upon land to save goods which are in jeopardy of being lost or destroyed by water, fire, or any like danger is not a trespass. The owner of land and of buildings assumes no duty to one who is on his premises by permissiononly as a mere licensee, except that he will refrain from willful or affirmative acts which are injurious. And, therefor, a licensee, who enters on premises by permission only without any enticement, allurement, or inducement being held out to him by the owner or occupant, cannot recover damages for injuries caused by obstructions or pitfalls. He goes there at his own risk, and enjoys the license subject to its concomitant perils.

Gibson v. Leonard, Supreme Court of Illinois, 32 N. E. Rep. 183, 247.

LOSS OF MATERIAL LIEN.—The New York statute as amended relating to mechanics' liens, provides that if the owner shall, for the purpose of avoiding the provisions of the act, pay by collusion the contractor in advance of the terms of the contract, for the purpose of defeating persons who have furnished materials or done work on the building, he shall, notwithstanding such payment, be liable, etc. Where the owner had in good faith paid the contractor, and the contractor had paid the subcontractor in full for his work and materials, a person who furnished material and did work for the subcontractor was not entitled to a mechanic's lien, though one installment was yet unpaid by the owner to the contractor.

French v. Bauer, Court of Appeals of New York, 32 N. E. Rep. 77, 120.

LIMITATION OF RIGHT OF DRAINAGE.—The owner of higher land is not authorized by the law to dig through or remove natural barriers, and thereby let onto adjoining lower lands, water that would not otherwise naturally flow in that direction. And in case he attempts to dig it, where it is reasonably certain that the proposed act of the proprietor of the higher lands will cause a substantial and irreparable injury to the private rights of the owner of the lower land by creating a private nuisance on his premises, a court of equity will afford relief by decreeing an injunction.

Graham v. Keene, Supreme Court of Illinois, 32 N. E. Rep. 130, 101.

RIGHTS OF BARE POSSESSOR OF PROPERTY AS AGAINST STRANGERS.—Bare possession of property, though wrongfully obtained, is sufficient title to enable the party enjoying it to maintain an action for its recovery against a mere stranger to the property, who takes it from him. One who takes property from the possession of another can only rebut the presumption of title in the latter by showing a superior title in himself, or in some way connecting himself with one who has it. One who has acquired the possession of property, whether by finding, in trust, or even by wrongful act, has a right to retain that possession as against a mere wrongdoer who is a stranger to the property.

Anderson v. Gouldberg, Supreme Court of Minnesota, 53 N. W. Rep. 636, 118.

BUSINESS MOSAICS.

Architects having School Houses in contemplation of erection are advised to refer to the advertisement of the J. L. Mott Iron Works on page V. The Wash-out Water Closet Range, here shown, is one of the best adapted devices for the purposes intended now in the market. Some of the Public Schools of this City are fitted up with them and are giving general satisfaction.

To make windows look like ground glass, brush the glass with a hot solution of salammoniac. It will evaporate instantly, leaving a beautiful radiated deposit.

Do you want a fireplace, and do you want it in an upper story where you cannot put a brick chimney? If so, call on Mr. J. Browell, 727 Montgomery street. He will do the work in a manner acceptable to the fire wardens, which means that the work will be done so as to avoid all possible danger from fire; and the assurance that the work is well done will be a source of permanent satisfaction.

It is asserted that 800 men who work in the Paris sewers are as healthy as any other 800 Parisians, and that they are especially free from infectious diseases.

Closet seats, backs and tanks, made in this city, from Oak, Walnut, Cherry, Maple, Prima Vera, etc., offer a great advantage to buyers and consumers in that they will get their ordered goods in *first-class style*, and not receive them bruised and mutilated, as they are in most cases, when imported from the east. Mr. J. G. H. Meyer of 417-419 Mission street has been manufacturings these seats, tanks and rims for the last four years and is now able to fill orders for the same in quality superior and in price equal to any imported from the East.

The money of the world is estimated to be about $10,000,000,000, of which about $4,500,000,000 is paper, $1,500,000,000 silver and $4,000,000,000 gold.

Chas. A. Hare, Pier 5, Steuart street, San Francisco, is general Agent for California, for the Gardner Sash Ribbon (aluminum bronze), Attachments and Pulleys, and can furnish this material in any quantity from one window up. He also takes contracts for fitting and hanging windows with this well-known device and makes a specialty of heavy ware house and elevator doors and the refitting of old windows. A five years written guarantee is given for all work done by him.

The Joseph Dixon Crucible Co., of Jersey City, manufacturers of Dixon's "America Graphite" Pencils, are taking time by the forelock by putting a fifth story, 175 by 75 feet, on their pencil factory. During the past Summer and Fall they have been unable to promptly fill their orders for Dixon's pencils, even though working their already superior facilities to their full capacity. It was therefore decided to push forward the work at once, instead of waiting until Spring, as intended. The new addition will be equipped with new and improved pencil machinery of their own invention.

In order to tell wrought iron from steel, let a drop of diluted nitric acid fall on the metal, washing it off after a few minutes. If steel, a black spot; if iron, a whitish gray one will be left.

Merchant & Co. have sent us one of their handsome Calendars for the year 1893; a most artistic production and quite in keeping with the meritorious qualities of their manufactures. Every house owner, and house builder, who believes in protecting home industries, should specify one of the brands of roofing plates manufactured by the Messrs. Merchant & Co., and so show his appreciation of the efforts made to introduce this most important industry into the United States.

Whenever ventilation is required, no better method can be used than the celebrated star ventilator of which this firm are the sole manufacturers.

The Pacific Pine Lumber Co., issued new price lists last month. Rustic No. 1, 1x6, 8 and 10 were reduced about three dollars per thousand, and on Rustic No. 2, 1x6, 8 and 10, two dollars per thousand.

During the course of the Mechanics' Fair just ended, William Schroeder, the manufacturer of art glass, had a number of skillful artisans at work making the intricate designs so much admired by the public. Whenever we passed his stand, we saw a crowd of appreciative people, watching with the greatest interest, the deft manner in which the practiced workmen cut the different colored glass to meet the requirements of the pattern, fitting and combining them till the elaborate effects aimed at were fully realized, and another work of art completed for the beautification of a residence and the enjoyment of its inmates. Mr. Schroeder's place of business is 39½ Fremont street near Mission.

Bennett & Schutte, of 148-150 Valencia street, have just received a fine line of mantels of the latest designs. Parties building will do well to call and see them when requiring anything in their line. See advertisement on page xiii.

The watch worn by John Milton is said to be exposed in a Chicago shop. The watch was made with raised figures on the dial to enable the poet to read the time of day with his fingers.

The necessity for perfect insulation of buildings has produced a large variety of building and sheathing papers in this market, as well as throughout the United States generally. The most favorably known of the various manufactures of this article is the P. & B. Building Paper, which is the only paper of the kind manufactured on this Coast The superior qualities of this paper for the purposes mentioned has been thoroughly demonstrated by the use of this article in the extensive buildings of the South San Francisco Land and Improvement Co. at Baden, San Francisco, San Jose and Oakland, also the Union Stock Yards at Rodeo and this city. The Paraffine Paint Co., 116 Battery street, San Francisco, besides manufacturing this and their well known P. & B. Paints, have also on the market for the past eight years the P. & B. Roofing. The latter product is daily growing in favor, and several long tests which the Company can with pride point to are developing a reputation for this article that is indeed an enviable one. All the products of this Company being entirely Californian makes the fact of their rapid progress a matter of satisfaction to all lovers of home industries.

CITY BUILDING NEWS.

Ashbury near Frederick. Cement walk; owners, N. C. and N. J. Dyer; contractor, C. L. Leffler; signed, Nov. 18; filed, Feb. 8; cost $100.

Block 13, Lots 3, 4, 13 and 14. Out-building and tank; owner, D. Lapouble; architect, Emil Depierre; contractor, L. Ceveghino; signed, Jan. 31; filed, Feb. 1; cost $1,700.

Bush and Powell. Plastering of a building; owner, Mrs. Ryer; architect, W. H. Lillie; contractor, J. J. Morehouse; signed, Jan. 18; filed, Jan. 20; cost, $1,700.

California and Sansome. Inside wood finish; owner, Mutual Life Insurance Co.; architect, Clinton Day; contractor, John T. Grant; signed, Jan. 26; filed, Jan. 26; cost, $25,332.

California near Drumm. Mill work and carpenter work; owners, Luning Co.; architects, Coxhead & Coxhead; contractor, M. C. Lynch; signed, Jan. 24; filed, Feb. 4; cost $8,600.

Clay and Leavenworth. Two-story frame; owner, Jos. Wolf; architects, Johns & Baleszynski; contractor, Adam Miller; signed, Jan. 18; filed, Jan. 21; cost, $5,200.

Clay and Webster. College; owner, Dr. L. C. Lane; architects, Wright & Sanders; contractor, Thos. McLauchlin; signed, Jan. 19; filed, Jan. 20; cost, $28,200.

Crescent Ave. near Bosco. Carpenter work; owner, Edward Norton; architect, M. G. Bugbee; contractor, W. A. Griffith; signed, Jan. 31; filed, Feb. 3; cost $1,295.

Dupont near Sacramento. Brick building; owner, Paul Fleury; architects, Pissis & Moore; contractor, Thos. H. Day; signed, Jan. 11; filed, Jan. 16; cost, $6,890.

Dupont near Sacramento. Plumbing, etc.; owner, P. F. Fleury; architects, Pissis & Moore; contractor, R. A. Vance; signed, Jan. 11; filed, Jan. 25; cost, $1,150.

Dupont near Sacramento. Plastering; owner, Paul Fleury; architects, Pisses & Moore; contractor, Chas. Dunlop; signed, Jan 19; filed, Jan. 25; cost, $1,390.

Ellis near Fulton. Plumbing and gas fitting; architects, Stone & Munson; contractors, G. and E. Snook; signed, Jan. 8; filed, Feb. 8; cost $1,017.

Ellis near Fulton. Plastering; contractor, Thos. E. Winter; signed, Feb. 8; filed, Feb. 8; cost $1,454.

Ellis near Fulton. Galvanized iron work and tin roofing; contractor, J. C. Robert; signed, Feb. 8; filed, Feb. 8; cost $1,660.

Fair Oaks near 22d. Alterations and addition; owner, John Christensen; architect, M. J. Welsh; contractor, Ivory Wells; signed, Feb. 4; filed, Feb. 4; cost $1,100.

Fifth Ave. near Point Lobos. Two story frame; owners, N. L. Lelean and A. O. Donogh; contractor, Chas. Murrell; signed, Feb. 6; filed, Feb. 7; cost $3,300.

Haight near Broderick. Alterations; owner, Thos. J. Walsh; architect, Wm. H. Armitage; contractor, Jno. J. O'Brien; signed, Jan. 27; filed, Jan. 27; cost, $3,300.

Hayes and Devisadero. Two-story frame, three flats; contractor and owner, Robt. Porter; signed, Jan. 21; filed, Jan. 21; cost, $6,000.

Hayes and Octavia. Mantels and gas-fixtures, etc.; architect, J. C. Newsom; contractor, Jno. Furness; sub-contractor, Bush & Mallett; signed, Jan. 19; filed, Jan. 20; cost, $1,270.

Howard and Fourth. Four-story brick and frame building; owner, Annie N. Farrell; architects, Shea & Shea; contractor, Jas. Cochrane; signed, Jan. 9; filed, Jan. 16; cost, $32,980.

Jackson near Central Ave. To build; owner, J. C. Johnson; architect, M. J. Lyon; contractor, Thos. Kinread; signed, Jan. 17; filed, Jan. 23; cost, $4,000.

Laurel near California. Cottage; owners, J. & Peter Schaeffer; contractor, Peter Rednall; signed, Jan. 2; filed, Jan. 23; cost $1,600.

Lombard and Taylor. Royal Wash Machine; owner, Claus Wreden & Co.; architect, W. Winterhalter; contractor, Rapp, Bepler & O'Neill; signed, Jan. 12; filed, Jan. 14; cost $1,400.

Lott near McAllister. Six flats; owner, E. E. Cook; architect, Wm. H. Armitage; contractor, Jos. Bucker; signed, Jan. 10; filed, Jan. 14; cost, $7,100.

Mission between 1st and 2d. Two-story brick; owners, Luning Co.; architects, Townsend & Wyneken; contractor, M. C. Lynch; signed, Feb. 7; filed, Feb. 9; cost $6,950.

Pacific and Dupont. Two-story brick; owner, Ng Chong; contractors, M. Fennell & Son; signed, Jan. 21; filed, Jan. 21; cost, $3,200.

Park near Holly. Cottage; owner, Frank Shoen; contractors, Miller & Miller; signed, Jan. 26; filed, Jan. 27; cost $1,350.

Pine near Hyde. To complete building; owner, Peter Jorgensen; architect, W. H. Lillie; contractor, C. P. Moore; signed, Jan. 17; filed, Jan. 18; cost $2,300.

Post near Taylor. Plumbing work; owner, Mrs. J. Pinet; architects, Pisses & Moore; contractor, H. Williamson; signed, Jan. 24; filed, Jan. 25; cost $1,344

Randolph and Arch. Cottage; owner, Wm. Sheppard; contractors, Morrison Cook; signed, Jan. 19; filed, Jan. 20; cost $1,400.

Rhode Island near Yolo. Five-roomed cottage; owner, Mary E. Eastwood; contractor, John Sandeen; signed, Jan. 28; filed, Jan. 31; cost, $1,292.

Roach bet. Filbert and Greenwich. To build; owner, W. A. Stringer; contractor, J. P. Sheppard; signed, Jan. 20; filed, Jan. 20; cost $1,960.

Sacramento near Franklin. Alterations to residence; owner, H. W. Newbauer; architect, J. E. Wolfe; contractor, John Furness; signed, Jan. 31; filed, Feb. 2; cost $2,040.

Spruce and Washington. Millwork; owner, O. D. Baldwin; architect, Samuel Newsom; contractors, Pacific Coast Door Co.; signed, Jan. 30; filed, Feb. 1; cost $1,666.

Spruce and Washington. Stone work; owner, O. D. Baldwin; architect, Samuel Newsom; contractors, Sutton & Johnstone; signed, Oct. 26; filed, Feb. 1; cost $8,300.

Spruce and Washington. Brickwork; owner, O. D. Baldwin; architect, Samuel Newsom; contractors, Richardson & Gale; signed, Jan. 26; filed, Jan. 27; cost $5,050.

Steuart near Mission. Carpenter work; owner, P. M. Patridge; architect, D. E. Mellis; contractor, Thos. H. Day; signed, Jan. 17; filed, Jan 18; cost $4,579.

Union near Mason. Three-story frame; owner, Samuel Wehrli; architect, H. Geilfuss; contractor, F. Klatt; signed, Jan. 27; filed, Jan. 27; cost $6,940.

ALAMEDA COUNTY.

Benton near Central Ave. To build; owner, A. T. Fletcher; architect, C. S. Shaner; contractors, J. E. Henderlong & Bros.; signed, Jan. 27; filed, Jan 28; cost $3,219.

Berkeley. Glass work; owner, State University; architect, Wm. Curlett; contractor, A. L. Campbell; signed, Dec. 30; filed, Jan. 27; cost $2,000.

Broadway, Oakland. Cast iron work; owner, P. and B. of T. of Pac. T. S.; architect, W. J. Mathews; contractors, Judson Mfg. Co.; signed, Jan. 16; filed, Jan. 21; cost $2,000.

Central Ave. near Park. Five-room cottage; owner, Eugene Young; architect, Alfred J. Wood; contractor, A. L. Campbell; signed, Jan. 25; filed, Jan. 25; cost $1,625.

Estudillo tract, San Leandro. Five-room house; owner and architect, Fred. Straub; contractor, M. G. Comancho; signed, Jan. 17; filed, Jan. 19; cost $1,100.

G. and H. and 7th and 8th streets, Livermore. Two-story frame school building; owners, Union High School; architects, Piercy & Hamilton; contractor, F. Meyers; signed, Jan. 3; filed, Jan. 13; cost $9,220.

Hudson and 2d. Two-story house; owner, C. G. Simonds; architect, L. Nichols; contractors, G. S. and G. H. Johnson; signed, Jan. 23; filed, Jan. 23; cost $3,418.

Inez tract, lot 2, Brooklyn. To build; owner, Edward Clark; contractor, Hugh McCracken; signed, Jan. 14; filed, Jan. 14; cost $2,660.

Newbury tract, Block E, Berkeley. Cottage; owner, Wm. C. Bissell; architect, John Conant; contractor, Jos. T. Francis; signed, Jan. 17; filed, Jan. 18; cost $1,050.

Santa Clara Ave. near 3rd Ave. Frame cottage; owner, Eliza White; architect, David Brehant; contractors, J. J. Boyle; signed, Jan. 23; filed, Jan. 24; cost $1,515.

Stuart near Fremont. Six-room cottage; owners, G. and A. MacMillan; architect, E. N. Hyde; contractor, J. J. Rose; signed, Jan. 13; filed, Jan. 19; cost $1,600.

Summit near Orchard, Oakland. Two-story frame; owner, E. C. Morrison; architects, A. N. Pattiani & Co.; contractor, J. J. Boyle; signed, Jan. 20; filed, Jan. 23; cost $4,700.

Tehama near Dover, Oakland. Two-story stable; owner, J. E. McElrath; architects, Wharton & Weigands; contractors, A. L. Kendalls & Co.; signed, Jan. 24; filed, Jan. 25; cost $2,580.

West street. One-story cottage; owner, Jas. McDonnell; architect, B. McManus; contractor, C. S. Barnard; signed, Jan. 26; filed, Jan. 27; cost $1,340.

Building News	36

WE notice that another attempt is to be made to cover over one of the few open spaces of San Francisco—we refer to the building of a Fire Headquarters at the corner of Bush and Market streets.

Down town in the wholesale districts the only open spaces we have are those made at the intersection of the cross streets with Market, and while other cities are demolishing their buildings to make open spaces for themselves, having seen the necessity of them, it ill becomes a city of San Francisco's reputation to retrograde instead. Let every other consideration go before we reduce our lung space. We don't feel the want of it now because fortunately tall buildings have not run rampant over the lower part of our city and there are yet a number of vacant lots to be filled, but when the whole will be put up solidly with high buildings we will vainly regret every foot of space given up.

There is no doubt a Fire Headquarters is a desideratum, but there are plenty of convenient vacant lots which can be condemned without having recourse to the one which is most objectionable, if built upon, to the health and the traffic of the busy part of the wholesale mercantile region.

THE recent delivery of a paper by Mr. Geo. P. Low, Electrician for the Fire Underwriters of the Pacific Coast, on "Electric Imposters," brought out very forcibly the fact that under existing practices the general public, in so far as electric light wiring in particular is concerned, is at the mercy of electrical pirates who unblushingly pursue their swindlings and generally escape prosecution because of their shrewdness or their irresponsibility.

The fact is that the only city on the Pacific Coast which receives systematic inspection of its electrical work is San Francisco, and even here the underwriters' inspector is frequently absent from one to four months each year. In almost every other city of the west, electrical charlatans have full swing, and the recent enormous increase in the losses sustained by fire underwriters from fires attributed to "Unknown Causes" circumstantially attest the hazard of their existing methods under which "veneered," "half-baked" and irresponsible electricians are permitted to foist most wretched electric work upon the public. A great many instances have been cited where all the wire concealed behind

plastering has been of various brands, long since condemned as hazardous, while at outlets, where wires are visible, short lengths of high grade wire havs been spliced on. A case has recently been found in which an electric wireman offered to pay a bribe to a building foreman to have the electric work closed in before an inspection could be made. It always creates no little trouble for an inspector to demand the raising of floors or the tearing off of lath and plaster, yet in several instances where this has been done, most hazardous electric work has been found by the local inspector, despite the assurances he had received *in writing* that the work was per requirements. Other cases have been found where the owner, wishing to light his house, that he paid handsomely to have wired, has learned to his dismay that his electric wiring consisted only of short bits of wire sticking out at center pieces and that the man who did his wiring and who "appeared to be a really clever electrician" was totally irresponsible or in parts unknown. It is a fact, admitted by all legitimate electricians that no instrument has yet been devised, nor is there any method extant of ascertaining the permanent electrical condition of electric wiring that has been placed in out of sight and inaccessible places.

The paper referred to lays particular stress upon and thoroughly proves the statement that electricians and fire underwriters have jointly committed a "national error" in permitting the placing of electric light wires in a concealed and inaccessible manner in buildings.

In order to test the condition of electric light wiring, a visual examination is absolutely necessary and the fact that the eye detects hazards and poor construction, which cannot be determined by any known means in concealed work, appears to be proof positive of the correctness of the position taken.

The paper shows the lecturer to be a very careful student of the situation and his independent position, and his freedom from any affiliation with all electric companies renders the solution he proposes for the problem, of special interest to architects. The contention is made that all electric circuits of whatever nature should be so run as to be accessible at all times. They should not be exposed to sight, nor is this necessary and he maintains that wires may be placed so as to be accessible with the same facility that ordinary wiring may be installed, whether the building be under construction or finished. With such accessible construction, no technical electrical knowledge is necessary to apply the requisite tests and every achitect may make his own inspection and assure himself that the installation is without a fire hazard.

To do this but two tests are necessary: first, the ability to withdraw and re-insert wires in their proper channel-ways, and second, the ascertaining by visual examination as to whether all wires are covered by a solid rubber insulation. Nothing could appear more simple.

The importance of this matter to architects cannot be underestimated and fortunately the editor, as a member of the California Electrical Society, is in possession of information establishing in part the correctness of the lecturer's ideas. To illustrate:—A large new modern fire-poof building on Market street, San Francisco, was wired by one of the most responsible electric companies in the country, with ordinary concealed wiring. Some months after, the same electric company wired a similar large office building on Montgomery street, but in the Montgomery street building the wiring was of the accessible construction recommended. In each of these buildings a new brand of insulation was used which was endorsed in the east but which, it transpired, has failed to give entire satisfaction in San Francisco. To rewire the Market street building has necessitated the chiselling up of tiling, mosaic floors, etc., with an expense of over $3,000 to the contractor and infinite annoyance to the owner and tenants, while should it become necessary to rewire the Montgomery street building, it can be done in less than a week without entailing broken plaster, great expense or other inconvenience. Again in refutation of the charge of impracticability of the plan of accessible concealed wiring is cited, the installation now about finished in the Mutual Life Insurance Company's building, corner of California and Sansome streets, San Francisco, which contains electric light, telephone, district telegraph and call bell wiring, all of which is concealed, all of which is accessible, and all so arranged so that subsequent wiring of any nature may be placed from any room in the building to any other room without breaking an inch of plaster or exposing an inch of wire. Moreover the architectural features of the building are not impaired in any sense. With such a system at hand it would appear that little else is to be desired in the way of facilitating electrical work or of insuring owners against the wiring troubles that have so long proved most annoying and exasperating.

ON the day of the inauguration of Grover Cleveland as president of the United States, Edward F. Searles, by a deed of gift, transferred the Hopkins' mansion in this city, to the Board of Regents of the University of California, to be held by them in trust for the use and benefit of the San Francisco Art Association.

The name by which the residence of the late millionaire will in future be known, is the Mark Hopkins Institute of Art. Mr. Searles object in making this generous gift, is to create a memorial that will exist as a commemoration of the achievement of one of California's noted men, and to found an art gallery that will serve for the use and enjoyment of the general public as well as for the benefit of the association that has been chosen to carry out the wishes of the donor.

The School of Design will be removed to and installed in its new home in the near future, and the nucleus of an art collection will have been formed.

The public is to be congratulated on this successful termination of Mr. Searles' endeavors, for many unforseen difficulties, that stood in the way of the realization of his wishes, were encountered, and had to be overcome by him, to reach the present consummation.

The field of usefullness of the Art Association is thus immeasurably broadened, and many beneficial effects should result to the community by a wise and judicious use of the means that have been placed at its disposal.

BY invitation of Mr. Jos. B. Crockett, President of the San Francisco Gas Light Co., the members of the Technical Society of the Pacific Coast visited the new works recently constructed at Laguna and Bay streets. These works, although in addition to those already in use, are of the most extensive and complete of modern plants. The gas is manufactured by the latest improved process.

The primary or heavy gas is first prepared from the coal which heats the chambers of the retort to a white heat when the crude petroleum and steam is introduced, which becoming superheated in the retort combines with the heavy gas to form the best combination of the chemical equivalents for this purpose. The heating and introduction of the separate ingredients into the retort has been ingeniously arranged so that the whole process is under the care and control of one man. From the retort the gas is carried over and through the scrubbing tank where several impurities and the greater part of the amonia is removed (and saved as separate products) and then through a washing process for taking out the last trace of amonia. The sulphureted hydrogen, (or bad smelling product) which was formerly removed by the use of lime, is here taken out by the use of iron oxide, which is regenerated by a current of air through an apparatus arranged by Mr. Jones the superintendent. By this improvement the ill-smelling gas is oxidized and carried off as a new compound having no objectionable properties, and the iron oxide may be used over again. Through the process, as here carried out, the gas is of the purest and best quality for illumination, heating and mechanical purposes.

The gas holder is one of the three largest in the world, the diameter is 165 feet and has a rise of 108 feet, formed in three sections. By the use of steel plates and superior workmanship the weight of the holder has been arranged to balance the difference between the gas and air pressure, therefore, no balance weights are required. The iron frame work surrounding and guiding the holder is a model of lightness and strength. Straining plates, beams or rods have been ingeniously introduced to counteract all weak points.

The buildings have been constructed with red stock bricks for the walls, and chocolate colored terra-cotta trimmings for openings and accentuated points. Some of the buildings will have the rooms or apartments subjected to great variations of temperature, consequently the walls were made of considerable thickness and strength to withstand the expansion and contraction of the iron floor beams. One of the difficulties encountered was to construct a fire-proof floor, and yet have it sufficiently elastic to allow for the changes in the iron construction under the variations of temperature. Through the theoretical and practical knowledge of the president and superintendent this difficulty appears to have been overcome.

H. T. B.

WHERE SHOULD THE KITCHEN BE?

WHE learned Dr. Price, who, in the last century, compiled the famous Northampton tables of mortality, would have been surprised as well as gratified, if he could have known the improvement which the statistics of the present day show in the expectation of the duration of human life. However, in that as in every other branch of research though "much has been done, more remains to do." Increased knowledge of the laws of hygiene and improved conditions have done much towards the preservation of health and the prolongation of human life, yet sanitary precautions have by no means been devised and applied to the extent they should be. Dwellings, even for the well-to-do, continue to be constructed on unscientific principles, with a barbaric, in a double sense, disregard of health and convenience. In many respects we have progressed little beyond the hut of the savage with a hole in the roof for the egress of the smoke. True, we have chimneys, and the smoke from our fires no longer torments our eyes, irritates our respiratory organs, nor begrimes our bodies, but the vapors and odors from cooking our food and allied operations still permeate our dwellings and offend our senses.

Kitchens and other household offices are still so placed that as "sparks do upward fly" so do the ill smelling fumes from saucepan, pot and kettle diffuse their volumes in parlor, hall and chambers. The advent of the boiled dinner with its accompaniments of the savory onion and succulent turnip is disclosed to the members of the household and their visitors long before the appearance of the meal on the family table. The preparation of salted cod-fish and mackerel is long known to the nose before those eatables greet the sight of the assembled household.

Just why these never ceasing, still beginning nuisances are allowed to maintain their place in the domestic economy of any intelligent family, is difficult to determine, but the fact remains the same that they do in ninety-nine cases out of a hundred. Seeing that the fumes arising from the household menage, immediately ascend so soon as liberated, common sense teaches us that if we desire to avoid the annoyance caused by their presence that the only effectual plan is to place the scene of the preparation of food on the top instead of the bottom of the dwelling as is usually the case.

Fatty, sooty and sulphurous vapors contaminate and speedily destroy curtains, carpets and upholstered furniture, besides causing no end of annoyance to all who encounter them. In spite of these acknowledged evils we seem to take infinite pains to secure their unfailing presence. And we shall always do so so long as our dwellings are built on the plans now usually adopted. Of course, the questions of convenience and expense, always controlling factors in house building, are to be considered. They would be immediately urged by those who are governed by, and are part of the *vis inertia* of all communities.

Such people are always opposed to change. No matter whether that change brings with it greater comfort and less

expense, they oppose it because it is a change. With such people it is useless to theorize or argue, nothing but the stern, undeniable logic of events has any weight with them. They have, like Ephraim and Manasseh, to be let along, till they wake up some fine morning with the usual ejaculation "Bless me who'd a' thought it?"

But leaving them to their lethargic repulsion, it would not seem difficult to show that kitchens and culinary offices might be placed immediately beneath the roof of dwellings and yet comply with the reasonable requisitions of economy, both as regard construction and service. Little examination will show that the cost of building in the first instance cannot be but very slightly, if at all, greater.

As regards service, there is something to be said. Fuel and household supplies are usually bulky matters and the transportation of such material and the disposition of waste and refuse call for the exercise of intelligence and practical ingenuity. The problem is not, however, so difficult of solution as it may seem. The every day experience of tenants of flats show that such conditions can be successfully met,

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute of Architects, meets second Friday of each month at 408 California street.

Geo. H. Sanders, Pres. W. J. Cuthbertson, Vice-Pres.
Oliver Everett, Sec. John M. Curtis, Treas.

Technical Society of the Pacific Coast, meets first Friday of each month at Academy of Sciences Building.

C. E. Grunsky, Pres. Charles D. Marx, Vice-Pres.
Otto Von Geldern, Sec. Geo. F. Schild, Treas.

California Electrical Society, meets the first and third Monday evenings of each month at the Academy of Sciences Building.

Geo. P. Low, Pres. C. O. Poole, Vice-Pres.
Max Caspari, Sec. H. T. Bestor, Treas.

Master Painters' Association of the Pacific Coast.

E. M. Gallagher, Pres. H. G. Jarman, Sec.

with no great outlay of expense or labor. A properly planned and constructed dumb-waiter would, in most cases, fully answer the needs of transportation, and the skilled architects and mechanics of the present day could easily devise methods of construction and use which would leave little to be desired in the way of convenience and labor, with the never failing complement of the latter, expense.

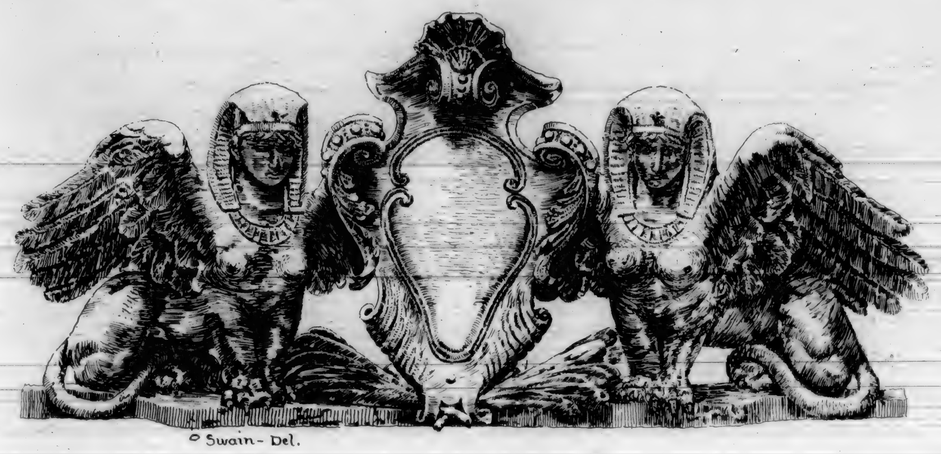
Of course the dining-room would have to be placed in the upper regions as well as its relative the kitchen. To that there could be little or no objection. As arranged on the plan now generally adopted, the dining, or room devoted to the purpose of partaking of meals is usually a sort of den or cellar which is a good place to get out of so soon as, to use a Homeric phrase "the rage of thirst and hunger is appeased." A change that could cause meals to be eaten in a light, airy and cheerful room is not one to be deprecated or avoided.

All things considered a system which would free the dwelling from the vapors and odors caused by cooking and its refuse, would thus seem not only to be desirable but practicable.

COUNTRY CHAPEL COMPETITION.

THE following is the report of the San Francisco Chapter A. I. A. on the competition for a Country Chapel, by the Students of the Chapter Class in Architecture, the premiated design appearing in our last number:

This design for a country chapel evinces the need of a systematic programme for the students to work to and the resultless waste of effort, when this point is disregarded. In this case there seems to have been no limit as to capacity, no limit as to denominational requirements, and no limit as to cost, all prime factors in the production of a practical design and without which it would be quite impossible for the most experienced architect to produce a design of any practical value. The committee would therefore recommend, that in future competitions a definite programme be drawn up for the proposed four competitions of the year, and that the Chapter students, or those who have qualified themselves to enter the competitions by becoming student members of the Chapter, shall be invited to compete for the



Chapter medals, in accordance with the schedule now in the hands of committee on classes. They also recommend that students who desire to compete for said medals in accordance with said schedule shall be enabled to do so on payment of a nominal sum to be hereafter determined on.

In the designs in question it is very difficult even to criticise them intelligently, as in no case have the definite needs of a house of worship been intelligently understood by the respective competitors.

However, taking a broad view of the various features and points of merit or demerit exhibited by the four designs, the Committee have unanimously placed "Z. Y. X." first in design and execution. As to design, while it displays no particular feature which can ally it with any known style it yet preserves the spirit and feeling of a country chapel and would not be mistaken for a library, a wayside inn or country store. The eaves of the tower are somewhat heavy and the tower is perhaps rather low, but on the whole both circumstances are in favor of the style adapted, and the nature of materials of construction, which appears to be the country rock of the neighborhood. There is also some artistic feeling in the quiet and easy lines of roof and spire and in the general trend of the lines of composition.

As regards plan, however, there is less to be said that is favorable though even there may be seen a good deal of architectural forethought in the arrangement of the cloister, *Porte Cochère* and driving shed in the rear, the shady arches of which look cool and refreshing on a hot day in the country. The entrance for the carriage porch is well managed; but when it comes to the entrances there is much to be desired. While it is well for the chief entrance to be in the front of the building, and in view of the use of the *Porte Cochere*, it would be difficult to arrange the entrance on the side. There should be a direct and straight line of entrance and exit between the auditorium and the outside steps. This is especially needed in the case of funerals, and a stampede in case of a panic on account of earthquakes or fire. In the rear or chancel end of the church, there seems to have been no clear idea in the mind of the designer as to the uses of the various parts. For instance, a deep chancel is provided with provisions for the choir to the left hand side, outside the chancel with a recess for a very small organ behind it. On the opposite side there is a font shown on a platform corresponding in size to the choir. This is wholly unauthorized by precedent, except in cases in which, as in the present case, precedent is entirely lost sight of.

The choir in the ancient Basilica occupied the center of the nave before the high altar, in the rear of which was placed the Bishop's chair in an apsis or bema. Afterwards the altar was placed in the bema, the Bishop's chair or throne to the left side, and the seats of the choristers on each side of the elongation of the apse. This is the arrangement in an Episcopal cathedral at the present time, the only true correspondent to the ancient medieval practice at the present time. In the Roman Catholic churches of Europe and America, the choir is almost universally placed in the western gallery, at the opposite end to the high altar in the east. The elongated chancel in the example under consideration is thus; it will be seen quite useless. If the choir seats were placed in it, as in the design marked, "lead pencil", and the extensions on each side for choir and font done away with, the arrangement would be restored to correct precedent and in accordance with modern practice in ritualistic churches.

The design marked "Wood Tick," has been placed second on account of the direct arrangement of the entrance and the simplicity and general harmony observable in the general elevation. The tower, however, (placed on the sloping line of the roof) is objected to, and the style appears to be an indefinite and confused sort of Gothic. The entrance would be greatly improved by leaving out the divisional column and the arrangement of the vestry and organ chamber is somewhat crowded.

The general form of the chancel and communion rail and the shape of the choir and chancel and position of altar are however, quite correct, and in this respect, better than the preceding design, and the baptistry, if placed at the northwest instead of the southwest angle (according to Orientation) would be in the authorized position, though some position at the chancel end is not uncommon at the present time. The execution of this design is very coarse and sketchy and at the same time, over done, and the placing of the building in the the picture is badly managed.

No. 3, "Lead Pencil." The arrangement of chancel in this

example is correct, but the arrangement of vestry robing room, etc., is without meaning or utility, and the entrance is unspeakably bad. The tower is too conspicuous for a small church and the general effect somewhat poor. The use of buttresses, however, in the body or nave of the building, and the arrangement of openings on each side are well managed and correct.

No. 4, "Fire." Seems to be simply a denominational chapel having a very large octagon recess, presumably for organ, choir, and pulpit platform, etc., at the end opposite entrance; and a confused encumbrance of entrance, vestibules, etc., on each side, blocking up light which is admitted only from the front and the first side bays of the nave. The elevation is very poor and ineffective, but still the whole design conveys the idea of a country chapel. The execution is poor and not improved by color.

The report on these designs is much longer and more elaborate than the merit of either one of them would render necessary, but is purposely developed to indicate the necessity for the adoption of a more systematic method for competitions in the future.

ILLUSTRATIONS

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

THE 6th Ward School, Oakland, is to be built of brick, stone and terra-cotta, and slate roof. It is one of several which are about to be put up in Oakland. W. J. Cuthbertson is the Architect and it will cost $35,000.

A residence on Nuuanu avenue, Honolulu, H. I., showing front and side elevations and ground plan, by Messrs. Ripley & Reynolds, Architects.

THE Abrahamson Building on the corner of Washington and 13th streets, Oakland, is by Architect C. Mau.

A residence for Mr. Thiele of San Jose is from the designs of W. D. Van Siclen, architect of that place.

BOOKS & PERIODICALS

ARCHITECTURAL COMPOSITIONS, by Henry P. Kirby, comprising a series of fifty sketches, part of which have been made in connection with actual projects, but many being the result of study during leasure moments. Bates, Kimball & Guild, of Boston, are the publishers.

A short notice like the present one cannot do justice to the subject. The well-known sketches and composition of the author previously published, have found their way into many of the offices throughout the country. The series of sketches before us have been made on heavy paper 15x20 inches, the designs are architectural and picturesque, the massing has been done with strength and the details handled effectively. Here the student and draughtsman can find pen drawing in almost any style to suit his taste, examples being given in the most severe outline through all the grades, including some very delicate lining, more like "copper plate work," and including full line work, having the effect of "half tone work."

It is a valuable work for the architects' office, viewed either from the designs to the skillful execution. Messrs. Osborn & Alexander, 301 Market street, San Francisco, have the album for sale.

LIPPINCOTT'S for March comes to hand and contains a finished story, "Waring's Peril," by Captain Charles King, U. S. N., and the usual amount of interesting reading.

The Puget Sound Lumberman is authority for the statement that the amount of standing timber in the State of California is in round numbers 100,000,000,000 feet; this is less than half the quantity that is credited to Oregon, and only about one-quarter the quantity in Washington. The land covered by timber in the latter state would form a belt around the world three miles wide.

On advertising page x will be found a list of practising Architects in the State of Washington.

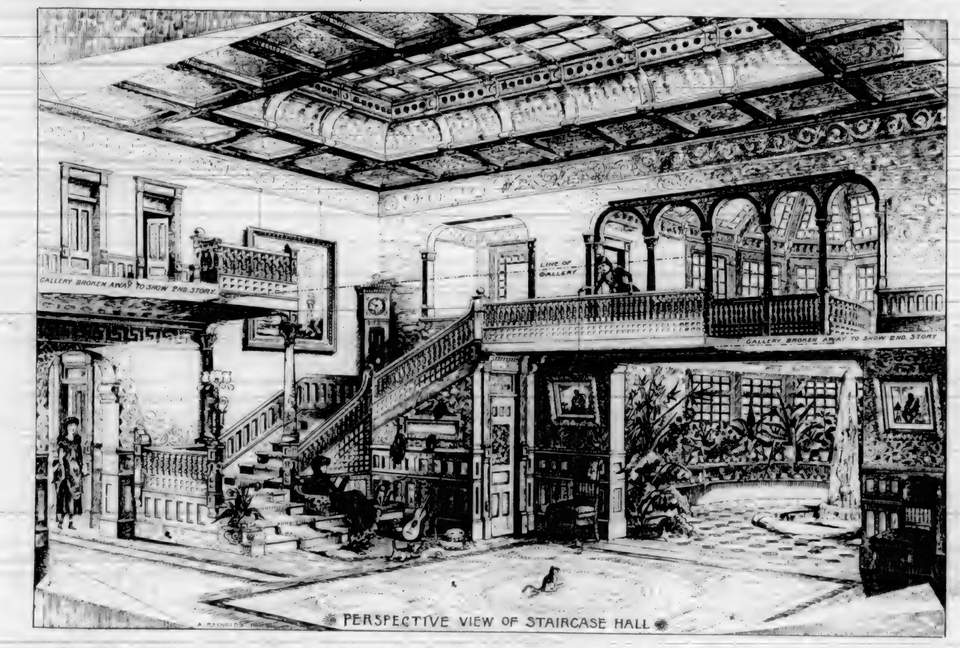
PLATING A TOWER WITH ALUMINUM.

THE work of electro-plating with aluminum the iron work of the new city hall tower in Philadelphia, a surface of 50,000 square feet, is progressing so steadily at the Tacony Iron Works, that it is expected that the great task, if carried on as fast as it has been this year, will have been entirely completed in a little over three years. It will require 20,000 pounds of aluminum to plate the entire surface of 50,000 square feet.—*The Age of Steel.*

The fact that the resisting powers of the metal Aluminum have been greatly over estimated, should render the Architect careful in the use of this metal, as both acids and the atmosphere will oxidize the metal far more than is generally supposed.—*Ed. Cal. Architect.*



INTERIOR VIEW OF RESIDENCE ON NUUANU AVENUE, HONOLULU. H. I., RIPLEY & REYNOLDS, ARCHITECTS.

MUNICIPAL USE OF SALT WATER.

THE advantages to be gained by the employment of salt water for street watering, sewer flushing, fire extinguishing and similar purposes in coastwise towns has received considerable attention from experts in municipal engineering during the past few years, and before long we shall unquestionably witness its widespread use for this purpose. Among others, H. P. Boulnois, a well-known English engineer, has had the subject under consideration, and makes the following report as to the practicability of its utilization:

"Watering the streets with sea water should be adopted wherever it is feasible, as it not only gives a delightful freshness to the air and dispels iodine, but it also causes the surface of the street to maintain its humidity for a longer period than when fresh water is used, as it impregnates the soil with hygrometric matter. This has been attempted artificially by adding common salt to the water used for watering. The general results may be stated as follows: Since the construction of the works the consumption of water for street watering has been annually less than 5,000,000 gallons at five cents per 1,000 gallons, instead of 7,000,000 gallons at twenty-four cents per 1,000 gallons, as before. There is also a considerable saving on the gravel and flint for macadamized roads, and the author believes that these roads can be maintained for about 15 per cent less than when fresh water was used. The salt water does not seem to hurt them in any way. During the summer months the dust is kept under by the qualities of salt water, and in the early autumn, if the surface coating is removed by the broom upon the appearance of the first frost, no evil effect is traceable to the use of salt water. No complaints are made by shopkeepers, jewelers, etc., and the three reasons urged by the committee of chemical experts have given no cause for anxiety. Used in sewer flushing, salt water has cleaned them thoroughly, and after five years' experience no nuisance of any kind has followed. Its effect in the Yarmouth, England, sewers has been to reduce and almost prevent the generation and accumulation of sewer gas. Sewers can now be entered at once on the removal of the manhole cover, which was not the case before. An 18-inch pipe sewer on a gradient of 1 in 300 was formerly constantly clogged by deposits; it is now kept thoroughly clean by two flushes per day from a 3,000 gallon tank, which fills the sewer two-thirds full. There are no deposits of any sort in the sewers, except in several of the larger ones, and there it has been reduced one-half since salt water has been used. As to the effect of salt water on iron, the author says that the syphons are of galvanized sheet iron only, but they have required no repairs since they were put in. As to the sulphates in sea water, no evil effects are traceable; the town possesses no manufactories, and no acids are discharged into the sewers. The salt water has never been used for extinguishing fires, though it is available if needed. The author does not recommend it for this purpose, as he considers that a dwelling would not be habitable after its walls had been saturated with sea water."—*The Sanitary Plumber.*

ARCHITECTURAL LEAGUE EXHIBITION.

THE eighth annual exhibition of the Architectural League of New York was almost lost this year in the spacious and magnificent halls and galleries of the American Fine Arts Society's Building, 215 West Fifty-seventh street, New York.

The exhibition opened on the 2d and closed on the 24th of January. The attendance was larger than heretofore, and in some respects the exhibit was more deserving. This, however, can hardly be said of the purely architectural department, for, although there were some excellent representations of executed work, and a number of meritorious designs, there were not so many of either class as were shown in the expositions of 1891–92. This may be accounted for by the fact that in the years named there were certain causes which stimulated the ambition of American architects. Thus, in 1890 the competitive designs for St. John's Cathedral formed a special and important feature of the exhibit, while last year the Columbian collection would have been sufficient in itself to make an interesting and instructive architectural show. But while this may be called an off year, it must not be concluded that there is any decadence of interest or degeneration of genius manifest in League work; rather the contrary, for the general work is above former standards, and several sets of drawings are decidedly original, we might say American, in conception with a breadth of treatment far beyond the scope of the mere imitators, and adaptors who could not if they would, and would not if they could, depart from the conventional track. First and most striking among these is the California State Building, to be erected in Jackson Park, Chicago. This is a spacious but low, yet imposing structure in the characteristic Mission style of the spanish settlements. Connecticut, Maryland, Rhode Island, New Hampshire, New Jersey, Pennsylvania, Nebraska, New York, North Carolina, Iowa, Georgia, Ohio, Minnesota, Texas and Massachusetts are also represented by designs of State building for the Columbian Exposition, but the Georgian design by G. L. Norrman, of Atlanta, is the only one which can be considered an exponent of a type. The design is characteristic of the Sunny South, where the public buildings have always been more ornate and graceful than in the more material North. It is of the Grecian temple style, but there is enough originality and boldness in the treatment to defend the architect from any suggestion of a too slavish conservatism. There is a beautiful proportion carried out in the details, and the whole is a harmonious picture.

Among the studies is a design by Henry B. Herts, for the Columbian Memorial Arch in New York. This was fully described and illustrated in a former number, but in passing we may express our regret that it is not to materialize in marble, or at least not so soon as was anticipated when its temporary forerunner was receiving the plaudits of the hundreds of thousands who passed under it three months ago.

If Mr. Herts had been an architect of the Pecksniffian type he might have had enough pull to work off on a committee a much less meritorious work by some unfortunate Chuzzlewit, but such is life, and even in architecture the reward of merit too frequently goes to the ostentatious pretension.

The grand market at Lima, by A. Page Brown, has something in common with the California design mentioned above although there is no similarity whatever in the buildings. The style is distinctively South American, with arcade and colonnade, and is a happy combination of the graceful Spanish-Morisco, with a leaning to the solidity of the Flemish.

The annex to the exhibit which includes antiquities, bric-a-brac, painting, sculpture, etc., would be deserving of a much more extended notice if it were not that our last year's description nearly covers the same ground, except that the patrons of the League have been more than ordinarily liberal in their contributions to the loan department.—*The Architectural and Building Monthly.*

TENDERS TO BE RECEIVED.

Treasury Department, Office Supervising Architect, Washington, D. C., February 23rd, 1893. Sealed Proposals will be received at this office until 2 o'clock P. M. on the 30th day of March, 1893, and opened immediately thereafter, for all the labor and materials required for Hospital and Attendants' Buildings, Laundry Building, etc., U. S. Quarantine Station, Angel Island, San Francisco, California, in accordance with the drawing and specification, copies of which may be had on application at this office or the office of the Superintendent at Angel Island, San Francisco, Cal.

Each bid must be accompanied by a certified check for a sum not less than 2 per cent of the amount of proposal. The right is reserved to reject any or all bids and to waive any defect or informality in any bid, if it be deemed in the interest of the Government to do so. All bids received after the time stated will be returned to the bidders. Proposals must be enclosed in envelopes, sealed and marked, "Proposal for Hospital, Attendants' Buildings, Laundry Building, etc., U. S. Quarantine Station, Angel Island, San Francisco, California," and addressed to,

W. J. EDBROOKE, Supervising Architect.

Treasury Department, Office Supervising Architect, Washington, D. C., March 2d, 1893. Sealed proposals will be received at this office until 2 o'clock P. M. on the 6th day of April, 1893, and opened immediately thereafter, for all the labor and materials required for the interior finish of the U. S. Post Office, etc., building at Sacramento, California, including iron work, lathing, plastering, iron stairs, concrete floors, joiner work, wood flooring, marble work, painting, polishing, glass, hardware, etc., in accordance with the drawings and specification, copies of which may be had at this office or the office of the Superintendent at Sacramento, Cal.

Each bid must be accompanied by a certified check for a sum not less than 2 per cent. of the amount of the proposal. The right is reserved to reject any or all bids and to waive any defect or informality in any bid, if it be deemed in the interest of the Government to do so. All bids received after the time stated will be returned to the bidders. Proposals must be enclosed in envelopes sealed and marked, "Proposal for Interior Finish of the U. S. Post Office, etc., Building at Sacramento, California, and addressed to,

W. J. EDBROOKE, Supervising Architect.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

DISTRICT COURT CANNOT ALTER PERIOD OF REDEMPTION.—A district court cannot, in the exercise of the discretionary powers conferred upon it by statute, extend or enlarge the period of time within which real property must be redeemed from a sale made in proceedings to foreclose a mechanics' lien.

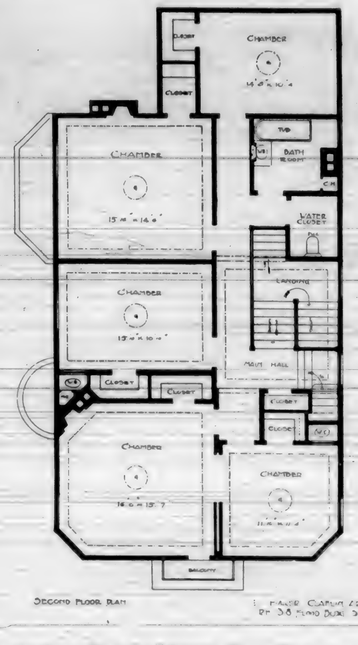
Anderson v. Kerr, Supreme Court of Minn, 53 N. W. Rep. 719, 43.

WHEN BUILDER IS NOT LIABLE FOR REFUSAL TO ACCEPT BID.—The terms of the proposals to receive bids not being proven, not that the builder was to be bound by the offer of the lowest bidder, and it not being established that a certain bidder was the lowest, the builder is not liable in damages for violation of contract.

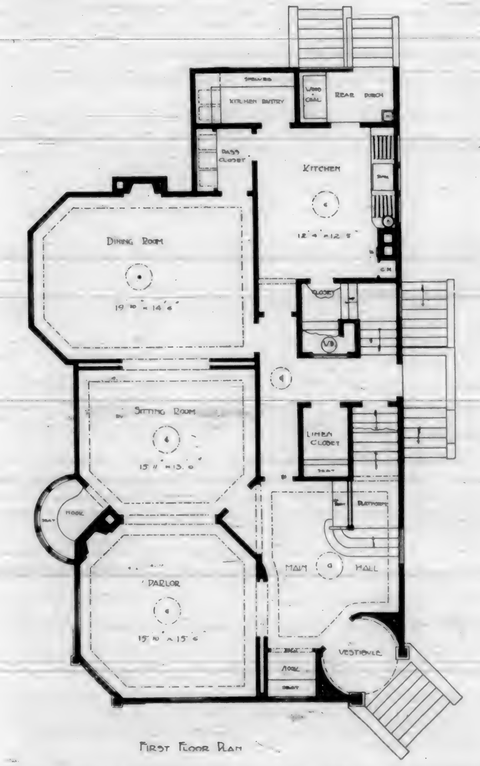
Reusch v. American Brewing Co. Supreme Court of Louisiana, 11 S. Rep. 719, 59.

JURISDICTION OF COURT OVER MECHANICS' LIEN.—Where there is due a contractor a certain amount for which, less his liens allowed his sub-contractors, laborers and material men, he is entitled to a lien, and the court allows the lien of such sub-contractors, laborers and material men, to an aggregate less that the amount for which the contractor would otherwise be entitled to a lien, and deducts that aggregate from such amount, allowing him a lien only for the remainder, the owner is not prejudiced by error in determining the amounts due the sub-contractors, laborers and material men, and cannot complain. Where a pleading for a mechanics' lien sets up but a single lien, no bills of particulars need be filed.

Menzel v. Tubbs, Supreme Court of Minnesota, 53 N. W. Rep. 653, 119.



SECOND FLOOR PLAN



FIRST FLOOR PLAN

A. H. WARD'S RESIDENCE. FULLER CLAFLIN, ARCHITECT.

EFFECT UPON LIENS OF GIVING FALSE RECEIPT.—A material man is not estopped from seeking to foreclose his liens for materials furnished by him to the contractor by reason of his giving a false receipt for the amount due him, to enable the contractor to obtain a payment from the owner, where the owner has paid out no money, and suffered no loss on account of such receipt.

Washburn v. Kahler, Sup. Ct. of California, 31 Pac. Rep. 741, 68.

PRIORITY OF MECHANICS' LIEN OVER MORTGAGE.—Under the statute providing for a lien for work on any building or other improvement on land under contract with the owner of the building and the land on which it is situated; and that such lien shall be preferred to all other liens and incumbrances attached to such building and land subsequent to the commencement of the building, a lien for work done as a mechanic on a building was superior to the lien of a mortgage on the property given and recorded before the work was begun, but after the building had been commenced.

Apperson v. Farrell, Supreme Court of Arkansas, 20 S. W. Rep. 514, 102.

MISTAKE IN LIEN STATEMENT.—The Oregon statute provides that the statement filed shall contain a true statement of the claimant's demand, after deducting all just credits. Plaintiff filed a lien stating that the value of the material furnished by him was $783, and that no payments had been made thereon. On the trial, plaintiff admitted that prior to the filing of the lien $100 had been paid, and stated that the misstatement in the lien was due to a mistake of his agent. Held, that the mistake not being one about the amount or price of labor, or the quantity or value of material furnished, in regard to which there might be an honest difference of opinion, but being one which could have been avoided by the exercise of reasonable diligence, the lien was invalid.

Nicolia Bros. & Co. v. Van Fridagh, Supreme Court of Oregon, 31 Pac. Rep. 288, 135.

ENFORCEMENT OF MECHANICS' LIENS.—The seller of a certain building agreed with the purchaser, to remove and completely rebuild it upon a lot belonging to the latter. The seller then contracted with a builder to furnish all materials needed, and to perform the necessary labor in accordance with the terms of his agreement with the purchaser. The builder failed to complete the reconstruction of the building as agreed upon, and also allowed lien claims to be filed against the property, for materials furnished to him for rebuilding, in an action to foreclose the liens, a mortgage given by the purchaser to secure the payment of his note to the seller, for the amount agreed upon as the price of the completed building, was secondary to the liens of the material men, and as between the seller and the purchaser and the seller, the latter was liable to the former for the failure of the builder to complete the contract.

Bassett v. Menam, Supreme Court of Minnesota, 53 N. W. Rep. 1064, 163.

Notes & Comments.

The Hawaiian Islands have not yet been annexed.

Edward R. Swain, Architect, has resumed the practice of his profession. Room 227, Crocker Building, eleventh floor.

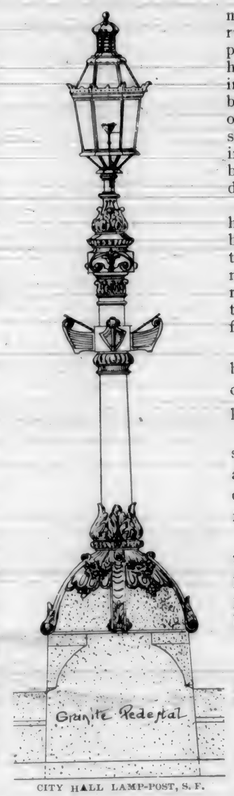
The Assembly Bill introduced by the Hon. J. M. Curtis, in regard to regulating the practice of Architecture in this state came up on the 8th instant and was defeated.

The municipal ordinances regulating the erection of buildings in the city and county of San Francisco are to be remodelled, to bring them more in harmony with the requirements of modern construction.

An interesting feature of the Government exhibit will be a model of the earth, with all the geometrical accuracy that mechanism and art can give to such a difficult representation. It is intended to form a part of the exhibit from the General Land Office of the Interior Department. So far as known it is the largest globe ever constructed. It will surmount a starshaped edifice, which pedestal will elevate the monster globe fifteen feet above the floor, so that it will rise above the surrounding exhibits. The globe will be sixty-three feet in circumference. A stairway in the pedestal will give access to a gallery at the base of the globe, which will revolve on a horizontal axis.—*Warner's Building Review.*

We have no genuine art, as a people, and we can never have so long as that which calls itself "Modern Civilization" possesses so little kinship with the true civilization which has created art in the past. We never consider the essential impulse of art, and it is pitiful to see the poor little attempts we make towards this end, still dimly felt to be desirable. We build big museums of art and crowd them with pictures filched from their homes; and casts which for purposes of art educating, are useless.

Then the people go and stand before the mute memorials of dead civilization, wistfully and hopelessly. It would be laughable were it not miserable. One is reminded of a child who gathers roses and lillies and thrusts their stalks into the sand, hopeful of a fair garden. —*Ralph Adams Cram in The Architectural Record.*



CITY HALL LAMP-POST, S. F.

In view of the large number of petty larcenies from buildings, special preference being shown for mechanics' tools, it would be well for mechanics of all kinds to have their names stamped in several places on all of the tools. A steel stamp costs a very small sum. Saws may be indelibly marked by writing your name on same with a sharp pointed piece of hard wood, which has been dipped in Nitric Acid.—*Wolfe's Building Review.*

Probably the oldest timber in the world which has been subjected to the use of man is found in the ancient temple of Egypt, in connection with stone work, which is known to be at least 4,000 years old. This was the only wood used in the construction of the temple, and it is in the form of ties, holding the end of one stone to another. When two blocks are laid in place, an excavation about an inch deep was made in each block, in which one of these wooden ties, shaped like an hour glass, was driven. It is, therefore, very difficult to force a stone from its position. These ancient ties are made of timarisk or Shittim wood, the same as that from which the ark was constructed.—*St. Louis Republic.*

Ambroise Bierce recently criticized, with much reason, the backhanded way our laws are made and enforced. Mr. Bierce has no patience with stupidity, and it does one good to read his vigorous language in denunciation of the senseless system by which our laws are enforced first and declared void afterward—after mentioning a particular case he generalizes as follows:

"In this State, in every State, thousands, millions of dollars are lost, great industries ruined, families reduced from prosperity to poverty, whole communities driven from their homes, by some Supreme Court coolly declaring unconstitutional laws that have for years been enforced by the terrible power of the State or the Nation. There is no way to distinguish such laws from other laws—the greatest jurist in the world cannot do it; yet of them it may be said that to resist them is calamity, to obey, disaster. The only safety is emigration.

"The overthrow of this barbarous and inhuman system is too much to hope for; it has behind it the inert strength of too many centuries. There is not a lawer, out of jail—and none get in—but can give you two score reasons why things should be as they are; and there is not a fool but will swallow the whole forty with never a twist of the face."

Obviously, the good of the community would be served by making the Supreme Court pass on the Constitutionality of Laws, before compelling the executive to enforce them.

Is it not worse than childish, is it not absolutely idiotic, to allow legislatures to make, and governments enforce laws, that it is unconstitutional and to make consequently the refinement of cruelty to enforce?

Mr. Bierce insinuates that the lawyers are too much interested in the continuance of the present senseless method to allow of reform; yet it is a reform that would be of incalculable benefit to the public.

The proposition to change the location of the State Capital from Sacramento to San Jose will be submitted to the people at the next election

One of the recent industries added to the already numerous manufactures carried on in Chemnitz, Saxony, is the production of curtains made of india-rubber as the main ingredient. The material employed for this purpose consists of 75 per cent of india rubber, 5 per cent of wool dust, 5 per cent of pulverized fruit stones, 10 per cent of bleached amber varnish and 5 per cent of bleached leather waste; to these being also added, if deemed necessary, a quantity of infusorial earth. The various substances thus named are together worked up with bisulphide of carbon in the most perfect manner into a thick mass, and from this are rolled out thin leaves, which are capable of being decorated with the greatest variety of ornamental patterns, and several of these leaves are combined to form a curtain.—*New York Sun.*

The Legislature lately adjourned has modified the Lien Laws.

BUSINESS MOSAICS.

Roche Harbor Lime in quantities to suit the trade, C. L. Dingley, Agent, 29 Steuart street, San Francisco.

Farmer—"Well, I've heard of red currants, black currants and white currants, but I'll stop chewin' if ever I heerd of alternating currents.—*New York Truth.*

Messrs. Dyer Bros. of 110 Main street have only been in business a short time, but by doing good work, and at living prices, giving satisfaction to their customers, they now number among their patrons the first architects of the city. They made all the fence work on the Hibernia Bank. Persons requiring iron work of whatever description should give them a call. Hammered wrought iron work a specialty.

Professor (to class in physics)—Now, describe this electrical machine if you please. Head Boy—It consists of a large glass wheel, turned by a crank. (Applause from the class.)—*Brooklyn Life.*

On page V of this number we would call architects attention to the advertisement of the J. L. Mott Iron Works. As with all things gotten out by this company the articles shown are unique in design and beauty of finish and well worthy the attention of those contemplating building a residence. The company's representative in this city is always willing to furnish all necessary information.

An interesting piece of information brought out during the Brussels conference is the fact that there are at present no less than $100,000,000,000 of counterfeit silver inmoney circulation in France, Belgium, Switzerland, Italy, Spain and Portugal.

The Vulcan Iron Works of 135-145 Fremont street, make everything in the way of stable fittings, also architectural and ornamental iron work of every description; hand hoists, tramways, refrigerators and ice machines. If you are in want of anything in their line call on them.

Careful scientific investigations show that the average speed of the transmission of earthquake shocks is nearly 16,000 ft. per second.

Persons building houses should not be without Dixon's Cement Laundry Tray, both from a sanitary as well as an economical point of view, no foul odors arise from them as is the case with wooden ones and they last longer and are easily kept clean. Mr. Dixon's place of business is 40 and 42 Eighth street between Market and Mission.

It is difficult to pardon in another the weakness that is your own pet vice.

The Phœnix White Lead and Color Works of 713 Sansome street, guarantee the Phœnix Pure Paint and will replace it free of charge with any material the architect may select if it is not satisfactory; being machine mixed it is ground to the last degree of fineness, does not chalk and is much more economical than paint mixed by hand. See advertisement on page XV.

Some people are of the opinion that heating a house by the use of steam or hot water has a tendency to make the house too damp or dry as the case may be. This is not so. Call on Mr. J. J. Lawton, agent for the Gurney heater, of 418 Fulton street, who will be pleased to give the reasons therefor and any information relative to the merits of heating by the use of steam or hot water.

The government of Belgium has formally taken over the telephonic system of that country.

Yellow Pine has been in use on this coast since the earliest days of its settlement. The superior qualities of this wood for finishing for house and office work should be more generally known. The wood grown down on the lower levels of the coast line make a superior framing lumber, as it does not have the springing tendency that Oregon pine has. As we ascend the mountain ranges the yellow pine becomes softer and better adapted for doors, sash and finish, and after reaching the summit, that grown on the easterly slope, resembles the eastern pines. Therefore, the location of the saw-mills has a very considerable bearing on the quality of the product.

The lumber mills of Messrs. Harris & Jones, are located in one of the best of these tracts of soft yellow pine, where they are preparing a superior quality of this lumber and which may be had at their yards, 728 Bryant street, in this city.

In a letter to the Rapid Safety Filter Co., W. T. Wenzell, M. D., Professor of Chemistry in the California College of Pharmacy, Department of the University of California, says:—From an examination of the city drinking water made by me some years ago at the instance of the Board of Health, I became satisfied of the great necessity of filtering the water. Not until I had seen and tested the workings of the Rapid Safety Filter, had I found a filter that to my idea could do this work properly.

Its chief merit lies in the fact that though connected with the service pipe, it is a non-pressure filter; the water filtering through it by percolation only and not by hydraulic or other artificial pressure. No pressure filter can prevent the transmission of microscopic disease germs.

I predicted at once the success of your filter, because I believed that there was not a family in San Francisco able to procure one that would persist in boiling unfiltered water and its germs for soup, tea and coffee, when the luxury of removing the impurities from these beverages by filtering the water could be enjoyed.

As an antiseptic filter, none better could be constructed. The filtering medium used is the best absorbent for odorous gases and putrid organic matter known; and renders the water so filtered as limpid, sparkling and wholesome as the purest mountain spring.

If every user of the Rapid Safety Filter derives as much satisfaction as I have from mine in my laboratory, and enjoys the exemption from sickness that my family has since its use in my residence, you will have abundant testimony to the superior merit of your filter over all others now in use.

CITY BUILDING NEWS.

Alpine near Ridley. To build; owner, Wm. Patterson; contractor, A. J. Duke; signed, Feb. 10; filed, Feb. 13; cost $2,569.

Ash Avenue near Laguna. To build; owner, August Koerber; architect, H. Geilfuss; contractor, L. D. Frichette; signed, March 2; filed, March 2; cost $3,400.

Battery between Pine and Bush. Store alterations; owner, Levi Strauss; architects, Wright & Sanders; contractor, T. McLachlin; cost $5,700.

Broadway and Steiner. Two-story frame; owner, M. Van B. Watson; architect, J. B. Mathison; contractor, A. Jackson; signed, Feb. 7; filed, Feb. 11; cost $4,297.

Bush near Powell. Plumbing, two-story frame; owner, Mrs. L. M. Bigelow; architect, J. C. Newsom; contractor, Wm. F. Wilson; signed, Jan. 31; filed, Feb. 16; cost $1,050.

Bryant Ave. near 24th. Alterations and additions; owner, Margret Burns; architect, E. A. Herman; contractor, H. Jacks; signed, Feb. 28; filed, March 1; cost $1,880.

California near Laguna. Three-story frame; owner, J. and Mary Dowling; contractor, Allen MacDonald; signed, Feb. 17; filed, Feb. 18; cost $5,300.

California and Taylor. Granite wall; owner, C. P. Huntington; architect, J. D. Isaacs; contractor, Robt. Kirk; filed, Feb. 18; cost $9,523.

California and Taylor. Iron fence; owner, C. P. Huntington; architect, John D. Isaacs; contractor, H. Ralston; signed, Feb. 27; filed, Feb. 28; cost $1,900.

Capp between 18th and 19th. Two-story frame; owner, W. T. Little; contractors, Hauston Bros.; signed, Feb. 27; filed, Feb. 28; cost $4,090.

Cook corner Pt. Lobos Ave. Mill work; owner, Carster Otten; architect, M. F. Le Berge; contractors, California Mills; signed, Feb. 14; filed, Feb. 15; cost $800.

Eleventh Ave. near Clement. One-story cottage and stable; owner, Chas. Lennon; architects, John & Balczynski; contractor, Jas. Geary; signed, Feb. 16; filed, Feb. 21; cost $1,850.

Eleventh near Folsom. Alterations, etc., except plumbing; owner, Ellen Huebach; architect, Jas. P. Brady; contractor, J. W. Connell; signed, Feb. 23; filed, Feb. 24; cost $1,350.

Elmira and Agusta. Cottage; owner, J. H. Dolan and wife; contractor, A. Klahn; signed, Feb. 16; filed, Feb. 16; cost $1,190.

Ellis and Mason. To build; owner, Y. M. C. A. Assn.; architect, A. Page Brown; contractors, Mahoney Bros.; signed, March 2; filed, March 2; cost $302,000.

Fair Oaks near 23d. Alterations and additions; owner, Roger Carroll; architect, J. F. Kenna; contractors, Currie & Loomer; signed, Feb. 17; filed, Feb. 24; cost $2,125.

Fifth and Clara. One-story frame; owner, architect and contractor, J. J. Clark; cost $2,150.

Fulton and Broderick. To build; owners, A. Brown & E. Gruber; architect, W. H. Lillie; contractor, J. G. Adams; signed, Feb. 14; filed, Feb. 14; cost $5,000.

Fulton and Scott. Two-story frame; owner, Henry Knust; architects, John & Balczynski; contractor, C. A. Hippely; signed, Feb. 13; filed, Feb. 14; cost $5,450.

Golden Gate Ave. near First Ave. To build; owner, Herman Wahing; contractor, J. Schuler; signed, Feb. 13; filed, Feb. 17; cost $3,400.

Howard and 8th. Plumbing, four-story brick; owner, Annie M. Farrell; architects, Shea & Shea; contractor, Richard Rice; signed, Feb. 28; filed, March 2; cost $4,000.

Humboldt near City Hospital. To build; owner, Geo. Hartman; architect, J. G. Behrens; cost $1,800.

Kearny near Clay. Iron work; owner, E. L. Heuter; architect, H. Geilfuss; contractor, Fred Wagner; signed, Feb. 23; filed, Feb. 23; cost $8,644.

Kearny and Clay. Remove old building and carpenter work on same; owner, E. L. Heuter; architect, H. Geilfuss; contractor, F. W. Kern; signed, Feb. 23; filed, Feb. 23; cost $5,550.

Leavenworth near Filbert. Alterations; owner, Amelia C. Rochford; architect, S. W. Heinenway; contractor, H. Behrens; signed, March 2; filed, March 2; cost $2,400.

Lyon near Haight. Cottage; owner, Robert N. Silver; architect, J. B. Wuersching, contractors, Home Bldg. Co.; signed, Feb. 23; filed, Feb. 24; cost $2,398.

Main street No. 344. Alterations; owner, Margaret Curtain; contractors, Craig & Fulton; signed, Feb. 13; filed, Feb. 17; cost $1,850.

Market near Guerrero. To build; owner, Benj. Goldfish; architect, W. H. Lillie; contractor, W. H. Wickersham; signed, Feb. 25; filed, Feb. 27; cost $2,600.

McAllister near Lyons. Two-flats; owner, Mary Doherty; architect, J. B. Wuersching; contractors, Home Building Co.; signed, Feb. 11; filed, Feb. 16; cost $3,000.

Minna near 7th. Alterations; owner, Sarah J. McLaughlin; contractor, J. Ehmann; signed, Feb. 17; filed, Feb. 17; cost $1,900.

Mission street, No. 1427. Alterations; owners, J. W. McElroy, et al.; architect, P. R. Schmidt; contractor; S. H. Kent; signed, Feb. 13; filed, Feb. 14; cost $3,800.

Octavia and Green. To build; owner, Konrad Schneider; contractor, Wm. Knopf; signed, Feb. 10; filed, Feb. 13; cost $3,900.

Pacific near Hyde. Millwork, 8 flats; owner, Pauline Greenberg; architect, W. C. Dickerson; contractor, W. R. Johnson; signed, Feb. 25; filed, Feb. 28; cost $1,525.

Perry near 5th. Two flats; owner, Annie Galfenther; contractor, Jas. McDonald signed, March 1; filed, March 3; cost $1,700.

Pine near Montgomery. Three-story brick; owner, Henry Cailleaud; architect, Emile Depierre; contractor, H. Behrens; signed, Feb. 28; filed, March 1; cost $3,600.

Pine near Montgomery. Three-story; owner, Henry Cailliaud; architect, E. Depierre; contractor, A. T. Mills; signed, Feb. 21; filed, Feb. 28; cost $2,250.

Point Lobos and 1st Ave. Plumbing; owners, Geary street R. R. Co.; contractor H. Williamson; signed, Feb. 16; filed, Feb. 16; cost $1,134.

Polk street, Nos. 1710 and 1712. Alterations and additions; owner, Jas. Podesta; architect, Oliver Everett; contractor, Fred Renfort; signed, Feb. 27; filed, Feb. 27; cost $2,625.

Post near Gough. Two-story frame; owner, Emma Taylor; architect, C. W. Kenitzer; contractors, Schutte & Krecker; signed, Feb. 28; filed, Feb. 28; cost $5,399.

Randall and Chenery. Eight flats; owner, Sophie Koster; architect H. D. Mitchell; contractor, J. N. McLeod; signed, Feb. 11; filed, Feb. 14; cost $8,540.

Scott near Vallejo. To build; owner, C. A. Murdock; architects, Coxhead & Coxhead; contractor, F. G. Kronnick; signed, Feb. 20; filed, Feb. 20; cost $3,763.

Sickles and Huron Ave. To build; owners, Jno. and Bridget Maloney; contractor, J. L. McLaughlin; signed, Feb. 13; filed, Feb. 24; cost $3,200.

Sullivan near Stanyan. Cottage; owner, Chas. Duffy; architect, J. Wuersching; contractors, Home Building Co.; signed, Feb. 11; filed, Feb. 11; cost $1,350.

Sixteenth near Dolores; Three-story frame; owner, Hannah Boyle; architect, H. Geilfuss; contractor, Henry Rohling; signed, Feb. 27; filed, Feb. 27; cost $4,418.

Tenerife near Susquahanna. Two-story frame; owner, Father T. Fitzpatrick; architect, T. J. Welch; contractor, W. J. B. Warner; signed, March 2; filed, March 2; cost $4,495.

Townsend near 4th. Three-story corrugated iron house; owner, David Hewes; architects, Percy & Hamilton; contractor, A. H. Plummer; cost $3,077.

Twentieth near Church. Two-story frame; owner, Etienne Garneaud; contractor, Jos. L. Bunet; signed, Feb. 20; filed, Feb. 21; cost $2,200.

Twentieth near Howard. Two-story frame; owner, Rachael Rosenblum; architect, A. J. Barnett; contractor, L. Wells; signed; Feb. 13; filed, Feb. 18; cost $5,000.

Twenty-first near Castro. Two-story frame; owner, J. A. McCormick; contractors, Marcuse & Remmel; signed, Feb. 27; filed, March 2; cost $3,200.

Waller and Ashbury. Two-story frame; owner, Wm. B. Dolan; architect, A. C. Lutgens; contractor, C. M. Mason; signed, Feb. 15; filed, Feb. 18; cost $2,330.

Webster near Geary. Two-flats; owner, Josephine Read; architect, W. H. Lillie; contractor, T. T. Pottinger; signed, March 1; filed, March 2; cost $3,000.

ALAMEDA COUNTY.

Addison near Shattuck avenue, Berkeley. Two-story frame; owner, R. Johnson; contractor, G. A. Emburg; signed, Feb. 18; filed, Feb. 21; cost $3,400.

Albion near Telegraph Ave., Oakland. To build; owner, Mrs. R. M. DeGolia; architect, J. S. Adams; contractor, John P. Baudin; signed, Jan. 30; filed, Feb. 2; cost $4,007.

B near Fifth, Haywards. To build; owner, H. P. Jessen; architect, E. W. Mervin; contractor, A. Ubhoff; signed, Feb. 7; filed, Feb. 13; cost $1,575.

Brush and 7th street, Oakland. Two-story frame; owner, J. T. Kelley; architect, Chas. Maul; contractors, Bassett Bros.; signed, Feb. 23; filed, Feb. 23; cost $6,445.

Ellsworth near Dwight Way, Berkeley. To build; owner, W. E. Loy; architects, Coxhead & Coxhead; contractor, E. A. Wheeler; signed, Feb. 4; filed, Feb. 10; cost $3,100.

Eighteenth and San Pablo Ave. Additions and alterations; owner, Mrs. J. E. Johnson; architect, John Johnson; contractor, C. N. Bolles; signed, Feb. 1; filed, Feb. 6; cost $3,230.

Ford's Addition, Lot 7, East Oakland. To build; Mrs. M. Ebeling; architect, A. W. Smith; contractor, H. E. Brown; signed, Feb. 8; filed, Feb. 9; cost $1,200.

Grant and Santa Clara Ave. To build; owner, Nellie Liese; contractor, A. W. Cornelius; signed, Feb. 13; filed, Feb. 15; cost $4,250.

Hobert and Grove, Oakland. Church to build; owner, Rev. T. McSweeney; architect, C. J. I. Devlin; contractors, P. B. and P. H. Hughes; signed, Feb. 1; filed, Feb. 3; cost $8,400.

Kelsey near Russell, Berkeley. To build; owner, L. C. Williams; architect, R. H. White; contractor, H. S. Haseltine; signed, Feb; 21; filed, Feb. 24; cost $3,800.

Lorina street and Ashbury avenue, Berkeley. To build; owner, J. L. Woods; architect, G. A. Bordwell; contractor, C. L. Lombard; signed, Feb. 18; filed, Feb. 18; cost $3,018.

Main and Second streets, San Lorenzo. Alterations and additions; owner, San Lorenzo V. Hall Association; architect, G. Bordwell; contractor, Wm. Smith; signed, Feb. 1; filed, Feb. 14; cost $1,895.

Morton near Santa Clara Ave. To build; owner, H. V. Herbert; architect, A. Steubit; contractor, J. J. Boyle; signed, Feb. 8; filed, Feb. 9; cost $1,875.

Oakland Heights Tract, Oak. lot 3, block L. To build; owner, E. A. Walz; contractor, W. H. Wellbye; signed, Feb. 16; filed, Feb. 21; cost $3,500.

Occidental near McKee street, Oakland. House and barn to build; owner, R. Wilkinson; architect, C. Winstanley, contractor, T. E. Armstrong; signed, Feb. 6; filed, Feb. 11; cost $2,600.

Pacific Ave. near St. Charles street. To build; owner, R. H. Baird; architect, F. P. Fisher; contractors, D. Straub & Son; signed, Feb. 13; filed, Feb. 15; cost $1,880.

San Antonio Ave. near Willow. To build; owner, B. Ghilieri; architect, Chas. Shaner; contractors, C. H. Foster & Son; signed, Feb. 8; filed, Feb. 9; cost $5,057.

Santa Clara Ave. and Encinal streets. To build; owners, J. H. & S. Harrisburger; contractor, A. R. Denke; signed, Feb. 15; filed, Feb. 17; cost $2,560.

Santa Clara Ave. To build work shop; owner, F. J. Fletter; architects, Percy & Hamilton; contractor, J. E. Henderiong; signed, Feb. 21; filed, Feb. 23; cost $1,086.

Teutonia Park, Block 6 and 7. To build; owner, Geo. Whittel; architects, Coxhead & Coxhead; contractors, W. T. Veitch & Son; signed, Feb. 6; filed, Feb. 24; cost $10,800.

Thirteenth Ave. and Twentieth, East Oakland. To build; owner, Isabella Wright; contractor, J. A. Aymar; signed, Feb. 21; filed, Feb. 24; cost $3,300.

Twenty-fourth and Eighth Ave., Oakland. To build; owner, Mrs. M. B. Smith; architect, W. J. Mathews; contractor, F. W. Knight; signed, Feb. 21; filed, Feb. 23; cost $10,393.

Union near Bancroft Way, Berkeley. To build; owner, R. H. Longbridge; contractors, W. T. Veitch & Bros.; signed, Feb. 18; filed, Feb. 20; cost $3,900.

Valdez and Den'n, S. M. Tract, East Oakland. To build; owner, Alex. Doig; architect, J. Conant; contractor, W. F. Whyte; signed, Feb. 16; filed, Feb. 16; cost $2,075.

Verdi near Railroad Ave. To build; owner, C. H. & F. Smith; contractors, Marcuse & Remmel; signed, Feb. 21; filed, Feb. 23; cost $2,850.

IT is to be regretted that the Governor vetoed the bill providing for a State Building for this city. It will prove to be "penny wise and pound foolish" to the people of California, as the saving in rents would have greatly overbalanced the interest on the amount of money required. We lose, besides, the chance of having a building that might have been made a most attractive architectural feature.

THE new section added to the lien law of the State of California by the last legislature, makes it obligatory on the owner of any proposed building, or structure when it is to be erected by contract, to secure from his contractor "a good and sufficient bond" in an amount equal to at least twenty-five per cent, of the contract price, which bond shall, by its terms, be made to inure to the benefit of any and all persons who perform labor for, or furnish materials to the contractor, failure on the part of the owner to exact such bond, renders the latter liable for the debts incurred by the contractor.

The design of this amendment is to afford more ample protection to the creditor class, and this object is achieved by making the owner financially responsible for the solvency of the contractor and the contractors bondsmen. Not a very just or logical method of procedure perhaps, but reasonably sure of being effective.

On the whole, the new law will we think be of benefit to the parties honestly interested in the welfare of the building business. It will have a tendency to cause owners to choose a responsible man in preference to an impecunious "cheap John" when giving out their work. It will require much precaution on the part of both owners and architects in the acceptance of bondsmen and without doubt responsible parties will be equally cautious about becoming security for irresponsible or tricky contractors.

Neglect of proper prudence on the part of either owner or bondsmen, will be so dearly paid, that the man who now secures a large amount of work at figures that will not cover the actual cost of construction will find it more difficult to

continue their methods, and will be ultimately driven from the business, or forced to mend their ways. The new departure will afford many a case for the lawyers.

Just what will constitute "a good and sufficient" bond will of course have to be decided by the courts, and the prospects are that a good many decisions will be rendered and appeals argued before positive precedents will be at the disposal of the would-be house builder.

Whether an owner would be safe after having secured a rich and prosperous bondsmen who should become insolvent before the completion of the contract; or in accepting a man of "straw" who should duly qualify before a notary (but whose real estate might be of no more value than an unimproved lot in a suburban cemetery) are problems that will perplex the brains of the architect, and possibly deplete the purses of the owner, till the law is again amended and further experiments made as to the best way to make men honest.

WIRING OF BUILDINGS FOR ELECTRIC LIGHTS.

IT is almost universally the practice in drafting specifications for electric light wiring to stipulate that "the loss in potential in circuits shall not exceed two (2) per cent" or that "the wiring shall have not more than two (2) per cent drop," meaning that the loss in volts on any conductor, due to the resistance encountered by reason of the current passing through that conductor, shall not exceed two per cent of the voltage applied. Why two per cent loss is so generally stipulated is not plain, neither is it always necessary that it should be specified in every case, as in some instances a loss of three, or four or even five per cent would be more advantageous to the owner of a building, than would a loss of two per cent. Neverless, a two per cent "drop" is generally specified, yet it is a fact that of all the larger buildings in San Francisco, hardly one of them comes up to the two per cent limit specified. When it is realized that fifty per cent more copper is required to wire a building under two per cent loss than under three per cent loss, the importance of the matter becomes apparent. To place the facts in another light: a certain building is to be wired for incandescent lighting under specifications calling for two per cent loss. To carry out these electric specifications would require the installation of, say, 3,000 pounds of copper wire. The electrician, however, realizing that the architect generally has no means of determining whether the specification has been adhered to in the matter of "drop" concludes to install the circuits at three per cent loss. He does so and what occurs: The insurance inspector examines the installation and accepts it, for he only looks at the work from the fire underwriters' standpoint and his certificate only attests that the wiring presents no fire hazard. The central station people also examine the work and finding it to be safe and properly laid out, they too pass the work, for they do not compare it technically with the specifications any more than the insurance inspector does. The current is thrown on to the wiring, it works satisfactorily, all lamps burn to the satisfaction of the architect, nothing more is said about the two per cent loss stipulation, the work is accepted and paid for and that is the end of it so far as ninety-nine cases in a hundred are concerned. Yet what has the wireman done: Instead of installing 3,000 pounds of copper wire, as called for under the two per cent clause, and as he was paid for doing, he wired the building for three per cent loss, and saved thereby 1,000 pounds of copper wire, for under three per cent loss but 2,000 pounds was required, and no one was the wiser.

These frauds, so palpable to an expert electrician, yet concerning which laymen are utterly ignorant, are practiced daily by all save a very few first-class wiring companies and indeed many concerns, ignore the loss requirement altogether in wiring, yet consider it in making up bids. Others will maintain that their work is figured for two per cent loss, say, while upon questioning it soon become apparent that they do not know how to figure drop in potential, or they will use a two per cent wiring table and will generally get a two per cent loss each on mains, sub-mains and ultimate circuits, or six per cent loss in all, while two per cent was called for. A large concern having a capitalization of several hundred thousand dollars, when questioned as to the fulfillment of the two per cent clause in a certain building it had wired, struck the keynote in the matter when it frankly and honorably admitted that it had not carried out the two per cent requirement for the reason that it could not do so and compete for business. It had, however, placed the wiring in accordance with commercial usage and it maintained that for that reason the work should be accepted.

The writer has frequently been asked to assign a reason why such a discrepancy so frequently exists between the bids of different electrical concerns on the same piece of work. Reasons for this may be found from the facts above recited. Some few concerns will follow the specifications vigorously in every detail, while others, taking advantage of the almost universal ignorance prevailing in regard to electrical matters contract to do work that they never intend to perform. A dual result ensues: Owners pay for something they do not get—but they do not know it—and the electric wiring business is utterly demoralized both physically and morally.

It must not be inferred that a two per cent specification is never advisable or that a three per cent clause will prove equally satisfactorily as in the instance cited. To lay down a general law even for a given class of building is impossible and each building must receive specific consideration both in the matter of proper loss in potential as well as in the load basis upon which to figure the circuits. It is evident then that the drafting of electric wiring specifications is a matter worthy of most serious consideration and concerning which the architectural profession is deeply interested.

THE NEW LIEN LAW.

THE following is a copy of the New Section to the Lien Law introduced by the Hon. J. M. Curtis and passed at the last session of the Legislature.

SECTION 1. A new section is hereby added to the Code of Civil Procedure of the State of California, to be known and designated as section one thousand two hundred and and three:

SEC. 1203. Every contract required to be filed under the provisions of this chapter shall be accompanied by a good and sufficient bond in an amount equal to at least twenty-five per cent of the contract price, which said bond shall be filed at the same time and in the same manner as herein provided for the filing of such contract, or memorandum thereof. Said bond shall, by its terms, be made to inure to the benefit of any and all persons who perform labor for, or furnish materials to the contractor, or any person acting for him or by his authority; and any such person shall have an action to recover upon said bond, against the principal and sureties, or either of them, for the value of such labor or materials, or both, not exceeding the amount of the bond; but such action shall not effect his lien, nor any action to foreclose the same, except that there shall be but one satisfaction of his claim, with costs and counsel fees. Any failure to comply with the provision of this section shall render the owner and contractor jointly and severally liable in damages to any and all material men, laborers, and subcontractors entitled to liens upon the property affected by said contract.

bled and unbled timber, results which in themselves justify the expenditure by the government of money on such work.

The Forestry Division will exhibit the methods pursued in this work at the World's Fair, which will be of interest, since nowhere in the world has such comprehensive and systematic investigation of timbers been ever devised. The working plans for a similar undertaking by the Prussian Government have only just been perfected.

Another exhibit of interest to railroad engineers and those interested in reducing forest waste will be a collection of the most approved types of metal railroad ties.

UNITED STATES TIMBER TEST WORK.

ALTHOUGH all the leading railroad engineers, architects, professors of engineering and others interested in the Timber Tests had flooded with hundreds of letters their Representatives and Senators and the Committee on Manufacturing in whose hands the special appropriation for the work was pigeon-holed, neither the Committee nor the House paid any attention to this expression of public interest. The Senate, however, realized that there was value in the work and sincerity in its endorsers and increased the appropriations for the Forestry Division by $8,000, that is twenty per cent of the amount asked and considered by those in charge as necessary to continue the work on a proper business basis.

Under the circumstances, the testing will be discontinued until after July, when the new appropriations become available and then proceed at the slow pace which Congress has set.

Although the result of the efforts of those, who took active interest in securing appropriations for the work were not crowned with that success which they deserved, this is the only proper method of influencing legislation and those interested in the investigation should not fail to move again when the new Congress assembles.

The first compilation of test results is now in the hands of the printer and will probably be issued within six or eight weeks as Bulletin 8, Timber Physics, Part II. It will contain the results obtained on Longleaf Pine and will especially discuss in detail the results of tests and examinations of

PROPOSED NATIONAL GALLERY OF HISTORY AND ART.

MR. Franklin W. Smith, a Boston gentleman, delivered on the 12th inst an illustrated lecture under the auspices of the Mechanics' Institute, describing his design for a national gallery of history and art.

His proposition is for the United States Government to take hold of the project, which will, if carried out afford a most interesting and instructive permanent exhibition.

The design exhibits eight courts and galleries, viz: Egyptian, Assyrian, Greek, Roman, Byzantine, Mediæval, Saracenic and East Indian; surmounted by American galleries, for illustration of the history of the United States, and a memorial Parthenonic temple. This temple to contain a hall of the presidents; an American Walhalla, such as stands to-day in grandeur and beauty of marble upon a hill-top of the Danube, a proud manifestation of the patriotism and artistic inspiration of the Bavarian people.

The courts are to contain reproductions in full size of dwellings, temples, monuments, etc., of their respective nationalities; typical of their religion, life and art.

It is proposed that the ranges of galleries enclosing the courts be filled with mural paintings, illustrating in its orderly, chronological succession the history of the peoples whose architecture is shown upon their walls; similar to the pictorial history of Bavaria in the national museum of Munich; the basement stories being filled with casts and models—architectural, artistic and historical; supplying abundant material for elucidation in study.

Mr. Smith reports great encouragement as the result of his explanations, in confident assertion that "It ought to be, it can be, it will be."

OBITUARY.

THE death of David Scannell, Chief Engineer of the San Francisco Fire Department, took place on March 30th. Chief Scannell was seventy-three years of age, and had been connected with the Fire Department of this city for a period of over forty years. He was born in the year 1820 in New York. He served through the Mexican war and took part in the battles of Vera Cruz, Cerro Gordo, Contreras, Cherubusco, Chapultepec, Carrita de Berlin and the City of Mexico, and was promoted to the position of Captain for bravery. In 1851 he came to California in time to take part in the memorable fire of that year. David Scannell was Deputy Sheriff at the time of the Vigilant Committee, and he was the first sheriff under the Consolidation Act.

David Scannell
Chief of Department

In 1860 he was elected Chief of the San Francisco Volunteer Fire Department, holding the office for six years and until the paid department was organized. In 1871 he was again elected Chief of the Paid Department which position he has held to the time of his death.

THE REDWOOD TREE.

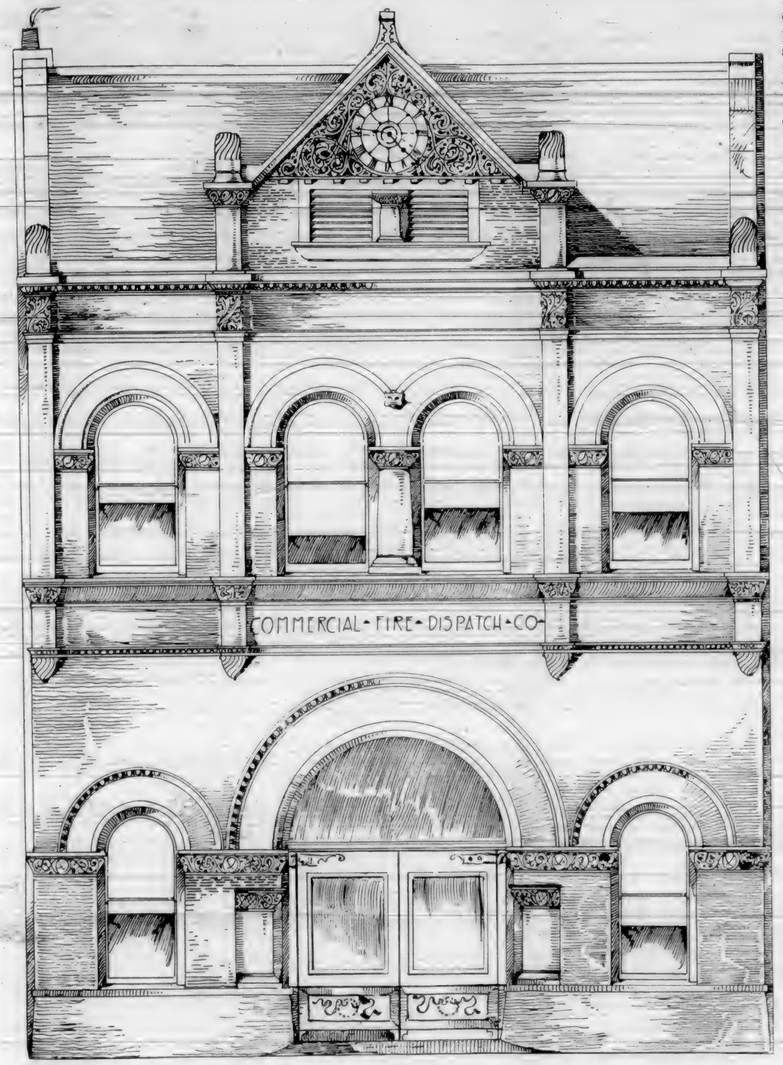
ON the camping grounds of the Bohemian club on Austin creek, and in the Armstrong tract near Guerneville, one finds the low land redwood inperfection. In such places there are often rings of great trees inclosing pits five or six feet deep and thirty, forty, or even fifty feet in diameter. Each of these pits is supposed to show where the venerable ancestor of the surrounding circle of trees once stood. Long before it fell, innumerable sprouts grew from the yet living roots. Afterwards, when the giant yielded, the rains washed new soil into the "bottoms" from the mountain sides to fill the deep chasm. For a century or so there was a struggle among the children of the fallen monarch, and at last only seven or eight remained to become great trees of twelve feet in diameter set on the rim of the pit formed by the decay of the roots of the ancient tree, and each having a complete root system of its own.

Other trees, seedlings or sprouts, grew up between them, and in a few more centuries the process of forming another redwood tree ring will be repeated about the largest of the second growth. Rings of this sort can be found in all stages of formation in every canyon and valley of the redwood country. Some very large rings still show the broken edges of the central tree's roots projecting like the staves of a barrel around the hollow, over-grown with ferns and wild oxalis, or filled to the brim with fresh, spicy redwood sprouts. The green spires of the living forest, 300 feet high, filter the air through their innumerable branches and shut out all but faint blue sparkles of the sky. The dust of one of the pioneers is under foot, and a little tree of last year's growth is struggling to gain a place.—*Charles H. Shinn in Century.*

Another instance of the remarkable vitality of the redwood may be given, a redwood tree growing on the bank of a stream, became undermined, and fell across the ravine, a portion of the roots still retaining their hold in mother earth, while the once lofty head found repose on the opposite bank. The tree soon adapted itself to the changed conditions of its life, and behold! A dozen or more small branches on the upper side of the trunk, ambitious to rise in the world, transformed themselves into redwood trees, drawing their nourishment from the parent trunk, and flourishing as though their roots were in nature's own soil.

THE USE OF BRICK.

IT is noticeable that during the year the use of the better bonds—English bond and Flemish bond—has been more common in the best work, to say nothing of the lavish use that has been made in some instances of the more complicated bonds in ornamental work. We are, of course, a long way yet from any frequent use of English or Flemish bond in every course in purely constructional work; it might be said, indeed, that these bonds are never used except in facade walls. But if our brickwork is to become what it ought, the abominable "American" bond must be adandoned or at any rate, restricted in its use to the cheaper and commoner constructions, except in cases where it may be made of value decoratively where constructional considerations are not paramount. Such cases are, however, very exceptional; and the use of the bond ought to be regarded as a sign of cheap and generally poor work. In addition to the wonderful variety of expensive bricks of ornamental color, the past year has shown more appreciation of the beauty of variety of color in common brickwork also; and there have been several instances which have come under our notice in which common brick has been used with telling effect for the sake of its variety of color, just as the yellow brick, which takes its name from the Madison Square Garden, where it was first used, is especially esteemed for its beautiful variety of color, for there is other yellow brick of which one sees only too much. To see the relative effect of the two, we have but to compare the wall of the Madison Square Garden itself, or any building in which this brick has been used (for we are now speaking merely of the effect of the brick in producing an agreeable wall surface without regard to the design of the building in which it may happen to be used)—we have but to compare, we repeat, the exquisite beauty of the wall surface of the Madison Square Garden, in which every brick differs in color from its neighbors, with, for instance, the wall surface of the yellow brick walls of the addition to the State House of Boston, now in course of construction, where the absolute monotony of color of the brick ruins the effect of the building.



PROPOSED NEW BUILDING COMMERCIAL FIRE DISPATCH CO., C. I. HAVENS, ARCHITECT.

In addition to the points we have already adverted to, we ought, perhaps, also to draw attention to the recognition of the joints of brickwork as a means of effect, and also of the texture of different bricks when contrasted with each other. Both these sources of effect have received much more attention during the past year than formerly, and brick diapers produced by different bonds and using brick of different colors have come much more into use. In England and France in the modern as well as in the old work these sources of effect are well understood.

On the other hand, it is refreshing to note that the monstrous wall of carefully culled red pressed brick is coming more and more into well-deserved contempt, especially among the best architects. We suppose it will take a long time for New York, as well as for some Western cities, to wean itself from the use of the vermilion paint pot. But this too will come in time. It is curious to note that in architecture, as well as in politics, while many of the best reforms emanate from New York, some of the worst abuses seem to find their last refuge there.—*The Brickbuilder.*

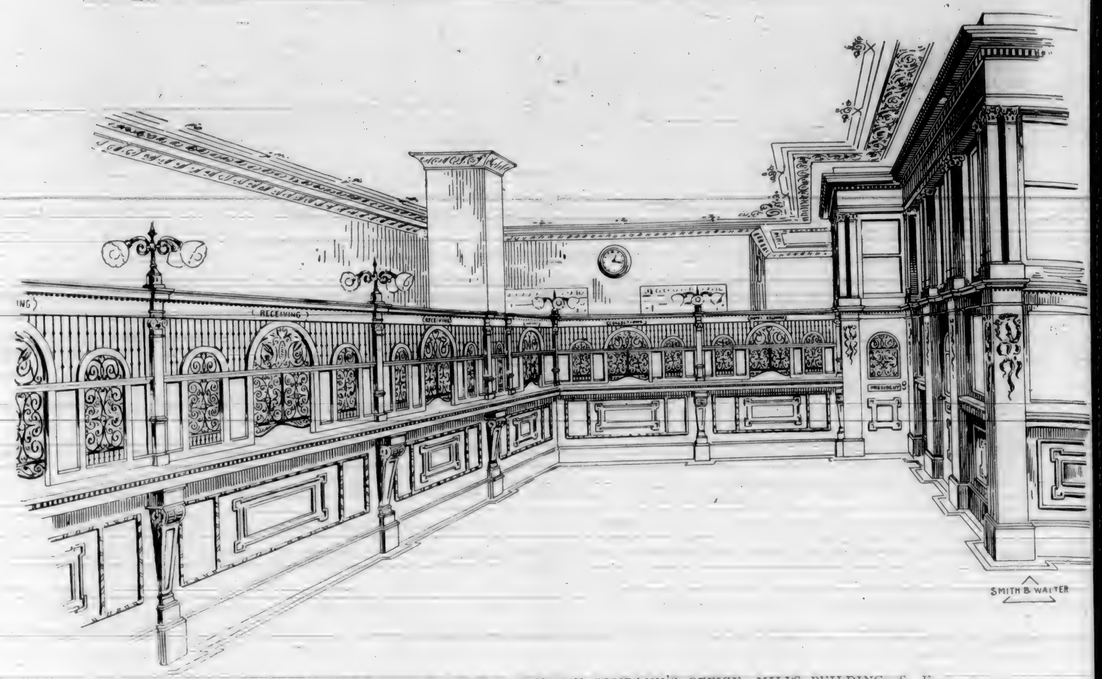
GAS LEAKAGE.

A very curious result from gas leakage is described by Dehnhardt in the *Centralblatt fur Bauverwalt.* It appears that an asphalt pavement had been laid down, and in spite of the fact of the material having been carefully mixed and applied, in about two years afterwards faulty places were observed to appear. These were duly repaired, and in the course of a short time became again faulty; the asphalt at these places was soft and tarry and exhibited upon the surface a number of tiny radiating fissures. The asphalt was broken up and the cause of the trouble investigated. Beneath the faulty places it was discovered that there was an escape of gas from pipes laid beneath the pavement.

On analysing samples of the impaired asphalt it was observed that it had absorbed the heavy hydrocarbons, and especially the benzine contained in the gas, rendering the pitch contained in the asphalt soft and tarry.

INQUIRY.

DOES any one know of a material to put on walls, of an impervious character, similar in quality to what is put on bath tubs so as to make them perfectly washable?



INTERIOR OF THE AMERICAN BANK AND TRUST COMPANY'S OFFICE, MILLS BUILDING, S. F.

ILLUSTRATIONS

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

THE Third Ward School is one of several which are about to be put up in Oakland, Elmer Childs is the architect.

A residence in Alameda with plans for same is for Henry K. Field. Architect, Fuller Clafflin.

THIS design for the Oakland High School was submitted in competition by Seth Babson. The basement provides a set of rooms for the janitor and family, a large Dining-Room, Kitchen and Pantries for use on festive occasions, and for a students' lunch room; a lecture room for the Superintendent, and class-rooms for night school. The first-story provides twelve class-rooms, a lecture room and rooms for the Principal and Teachers. The third floor provides a large assembly hall and ante rooms, drawing rooms and rooms for classes in chemistry, physics, and their apparatus.

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute of Architects, meets second Friday of each month at 408 California street.

Geo. H. Sanders, Pres. W. J. Cuthbertson, Vice-Pres.
Oliver Everett, Sec. John M. Curtis, Treas.

Technical Society of the Pacific Coast, meets first Friday of each month at Academy of Sciences Building.

C. E. Grunsky, Pres. Charles D. Marx, Vice-Pres.
Otto Von Geldern, Sec. Geo. F. Schild, Treas.

California Electrical Society, meets the first and third Monday evenings of each month at the Academy of Sciences Building.

Geo. P. Low, Pres. C. O. Poole, Vice-Pres.
Max Caspari, Sec. H. T. Bestor, Treas.

THE regular monthly meeting of the San Francisco Chapter A. I. A., was held on the 15th inst. A communication was received from Alfred Stone, Secretary A. I. A. in reference to the eligibility of architects to join the Institute, explaining to all inquirers that the first step to be taken is to become a member of the Chapter in the vicinity where they reside, as it is necessary that every application for fellow membership in the Institute should be endorsed by the President and Secretary of the Chapter of the Institute of which the applicant is a member.

The printed report of the proceedings of the Boston Society of Architects was received and the secretary instructed to suitably acknowledge the receipt thereof.

The following report on the Students' classes was adopted:

This Chapter of the A. I. A. from its inception, has, among its other objects, the promotion of the general welfare of the pupils of its members and that the education and guidance of these students should be carried along

through certain well defined lines of study in the art and science of Architecture.

If through the isolated position of our section of the country we have not accomplished all we could have wished, yet it has been the endeavor to animate the student of art and to direct him by some well directed and persistent effort on his own part to attain the requisite skill to render his ideas in pictorial expression as a medium for the conveyance of his thoughts to others.

Your committee on classes herewith submit the following report on the drawings and models made by the students dur'ng the year 1892, and placed on exhibition at the rooms of the Chapter.

The Students' Classes have been under the immediate supervision of Mr. Geo. H. Sanders, the President of the Chapter, and it is in a great measure due to his untiring zeal and painstaking care that the classes have advanced to its present state of vitality and promises to overcome all obstacles. The studies in free hand drawing from the "flat" the "model" or from "nature" have been directed by the president through his personal attention in the class room.

The modeling class has been under the instruction of Mr. V. A. De Prosse, and the exhibit shows that the pupils have worked with an enthusiasm and artistic feeling which is highly commendable. That the almost imperceptible undulations of the lines and surfaces have been so closely following in the models is proof that the instructor has succeeded in gaining the hearty co-operation of the students in the work.

CLASS IN DRAWING.

1st mention—Mr. Linden Bree: His second years course, comprising a series of nine subjects that have been worked out during a period of one year. Each subject shows a gradual improvement over the previous one, the first example being a leg, and the last a heavily draped figure. These drawings show a greater degree of excellence than any others on exhibition.

2d mention—Mr. E. Blankenberg. His third year, five subjects exhibited. The foliated capital is an excellent piece of work. The color subject, autumn leaves, is well done and shows an artistic feeling. This series of drawings shows that the pupil has natural gifts that with a little more concentration and persistency would bring out some superior work.

3d mention—Mr. H. E. Harris. His second year; two subjects are represented, a large "torso" and a large nude figure. These drawings show that the pupil has set his standard beyond the ability to execute, the attempt is praiseworthy when sufficient time and study is used to work out the details in a thorough manner. The trials in this case argues well for future success.

4th mention—Mr. J. H. Applegarth. His second year; five subjects are presented, hands, feet and legs. They are well executed, the outlining is clean and clearly defined, which, with a little more time and persistent energy applied to the finishing touches would have shown to better advantage.

5th mention—Miss Eda Menzel. Four months' work in preliminary studies; profiles and hands. The outlines and shading has been done with a degree of care and study which promises exceedingly good results in the future.

6th mention—Miss Belle McCuaig. Four months' study in profiles and shading. The outlines as done by this pupil show fairly well, and with study may bring good results.

THE MODELING CLASS.

1st mention—Mr. C. A. Meusdorffer. A grape leaf after nature. All the veins and undulating surface of the natural leaf is shown with precision and care.

2d mention—Mr. H. J. Van Vlack. A "Renaissance" scroll, after model, the contour being well relieved and the lines sharp and clean.

3d mention—Miss Eda Menzel. A leaf scroll, after model, and worked out with spirit and delicacy.

4th mention—Mr. H. Hobart. A seraphine head, from a plaster cast, also a girls hand after a life cast.

5th mention—Mr. Lloyd B. Brown. A "Renaissance" scroll, from the cast.

6th mention—Mr. H. Meyers. Model of ears after a life cast.

After disposing of routine and new business the Chapter adjourned.

MUNICIPAL GOVERNMENT OF BERLIN.

FROM our contemporary, *Fair Play*, we take the following description of some points of interest in the municipal government of Berlin. There is much food for thought in this article, and much that might with advantage be adopted by other cities.

Berlin is the best-managed city in the world, and its city fathers regulate the style of the buildings which shall be put up. You can't build a dog kennel without showing a design of it at the City Hall, and no man can put up a signboard on his own house until he has shown a diagram of it and has gotten the permission of the Government. You can't put down a pavement in front of your house without a permit, and the Government watches your building and insists that you make your walls just so thick, and the ceilings must be of a given height and the fronts must be of a uniform pattern. In building the house you are not allowed to litter the street with your bricks and mortar, and all the materials for building must be kept inside of the lot.

You have to fence off the street while the building is going on, and when your house has reached the height of the second story you must build a roof over the sidewalk to prevent the bricks or mortar falling on those passing below. The building is done much better than with us, and much more economically. Nearly all the mortar is mixed at one place, and there is a mortar company here which sells the mortar ready mixed to the builders, and which carries it about in iron wagons, and delivers it just where it is needed. There is no reason why such a company might not make money in the cities of the United States. This Berlin establishment is paying dividends of 25 per cent on its capital, and it sells its mortar like coal, at so much per wagon load or per ton.

I don't know how much New York runs behind every year, but there is scarcely a city in the United States that is not increasing in debt; Counsul General Edwards tells me that Berlin makes a profit of 5,000,000 marks or $1,250,000 every year over all her expenses. The city here owns two-thirds of the gas stock and it sees that its people have good light. There are gas lamps on the corners of every street, and the posts are of a tasteful pattern. Each lamp has four burners and the lamps are so aided by reflectors from above that there power is doubled. The posts are higher than

ours, and some of them have argand burners. It is the same with fire insurance.

The city insures its own buildings, and it is against the law for another insurance company to give out policies on buildings. The city, in the first place, sees that the buildings are properly put up and that the protection against fire is of the best character, and it then makes every man take out an insurance policy to prevent loss in case of fire. The insurance stock is good, and the city, of course, makes money by it. The only other insurance companies of Berlin are those which insure life and personal property. You can have your furniture insured by a private company, but the police are likely to step in and see that you don't overinsure it. All foreign insurance companies have to own enough city bonds to guarantee any losses which their subscribers might sustain. The Equitable, the New York Life and other American companies have offices here and they do quite a large business.

The streets are well kept. Berlin is fast becoming a city of asphalt, and you can drop your handkerchief almost anywhere and pick it up without soiling. The city takes care of its own sewers, and it has a number of farms on its outskirts over which these street-sweepings are scattered by the paupers of the city. The sewage is pumped out of the sewers on to the farms, and thus the land has become the most fertile in Germany. A large part of the cleaning of the streets is done by boys who get something like twenty-five cents a day and who are at work on every block gathering up the dirt as it comes, and on a wet day scrubbing off the streets with rubber hose. These boys sometimes work in gangs, and a half a dozen of them will take up a street and push the dirt on to the sewers, leaving the road as clean as though it had been scrubbed. If these scrubbings are done at night clean sand is scattered over the street to prevent horses or men from falling. The whole city, in fact, is run in the interest of the people and of health and beauty, rather than in the interests of politicians. It costs more than 2,000,000 marks a year to keep the streets clean. There are 700 street cleaners. The civil service rules obtain even as to these boys, and their wages are raised after they have been working on the streets for three years.

A COUNTRY RESIDENCE.

The buildings are kept as clean as the streets. Every man has to wash down his house so often, and it is against the law to put up bill boards or to paste posters on the houses. When Buffalo Bill was here he was almost crazy because he could not get any place to plaster up his big posters of his "Wild West" show. The only arrangement by which posters can be put up is in connection with round sheet iron tubes, which are on the corners of the streets and which are about fifteen feet high and of the diameter of a hogshead. They are especially for the pasting of big bills. They are not unsightly and on them you find the theater advertisements and business posters. Within the last few months the Urania company has been putting up advertising pillars all over the city, after a plan which forms perhaps the best advertising scheme in existence. These pillars are about fifteen feet high and they are by no means unornamental. They are as big as a flour barrel, but are octagonal in shape, and they are the most valuable guide that any city can have.

These advertising pillars are connected with the observatory of the city, and there is a clock on each of them that always gives the correct time. Above the clock there is a star showing the points of the compass, so that you can tell the directions from any place you may happen to be. Below this star there is a globe which moves by machinery and which tells you the positions of the stars from day to day. Besides this stands the clock, which has four round disks in different sides of the pillar. One of these gives the time at Berlin. Another gives the world time and a third shows how the earth stands in the solar system from day to day. Below this, with shades throwing an electric light upon them at night, are places for advertisements, which are in frames under glass. These revolve every minute and mixed up with the advertisements are tables of information about the city.

In one of the plates below them there is the time of the trains leaving the city by all the roads, and another plate shows you the condition of the barometer, the thermometer, and of the humidity of the air from hour to hour and keeps a record of it. Upon these pillars you can alway find the nearest police station and the nearest branch post office, and there is a little plan of the section of the city in which the pillar stands, with the streets plainly marked, so that by going to one of these you can always find just what you want without asking questions. I do not know the cost of these advertising pillars but as new ones are being rapidly put up I judge they must be profitable. Such other street advertising as is done is with the sandwich men or by dodgers. You find men distributing bills everywhere and there are plenty of grotesquely dressed figures carrying bill boards. The people advertise very well in the newspapers, and manage to make their wants well known without defacing the buildings.

They tax you here on your income, and they get at your income by looking at your style of living. It is generally estimated that a man spends one-third of his income for house rent, and as I paid 150 marks for rent they estimated that I made 450 marks a month. If I had had better rooms I would have paid more tax, and if a man lives in fine style here he cannot evade taxation. Every man who makes more than $105 a year here is taxed on his income, and everything under the sun in Berlin pays a tax of some sort or other.

One of the curious institutions of the city is an intelligence office, as it might be called, where records of passports are kept, and where you can go and find out just where any man or woman is stopping. If John Smith, who owes you a bill, moves to another part of Berlin to escape you, you have only to go to this office, and by paying a few cents you will get a report which will tell you just where he has lived in the city and where you may find him at present. There is no chance for a man to escape or hide here, for the argus eyes of the government are always upon you.—*The Press*, New York.

PLAN OF COUNTRY RESIDENCE.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

WHAT CONSTITUTES NOTICE OF MECHANIC'S LIEN.—A statement in a lien notice that claimant agreed to furnish the contractors certain windows, doors, etc., for a building, without specifying the quantity in any way, or that the same where all the doors, windows, etc., used in the construction of the building, does not give the owner sufficient notice.

Tacoma Lumber and Manf'g Co. v. Wolff, Supreme Court of Wash. 31, Pac. Rep. 753, 57.

MECHANICS' LIEN FOR MATERIAL USED IN PUBLIC IMPROVEMENTS.—Under an act which provides that one claiming a lien for material furnished, etc., towards the performance of any public improvement by the city of New York, shall file a notice of his lien, with the comptroller and with the head of the proper department, stating the amount of his demand after deducting all just credits and offsets, and also "that the work was done or materials were furnished to the contractor," "and they were actually performed or used in the execution of the contract with the city," a sub-contractor who willfully and fraudulently misrepresents in his notice of a lien the amount which is due him, by including therein a large quantity of material which he knows to have been rejected by the contractor and not used in the work, is not entitled to a lien for the portion of the materials actually used in the execution of the contract.

Goodrich v. Gillies, Supreme Court of New York, 21 N. Y. S. 400, 156.

INNOCENT ALTERATION OF CONTRACT WILL NOT AVOID SAME.—Where one contracted to purchase a saw mill of another and paid a portion of the purchase price down, afterwards bringing action to cancel the contract, and to recover the amount paid there under, claiming that the seller had lowered the dam which regulated the supply of water to the mill about thirty-four inches, in consequence of which the power of the mill was reduced about one-half; that the seller had been compelled to do this by an abutting owner, whereas he had represented to the purchaser that he had a clear right to maintain the dam at its height at the time of making the contract, and it being shown that the dam was not lowered more than six inches, and that the seller had informed the purchaser at the time of making the contract that he might have to lower it that much, the purchaser was not entitled to be released from his contract. The contract for the sale of the mill included all the lumber in the mill yard, at a certain rate per thousand feet, but as at the time of executing the contract no measurement of the lumber had been made, it was agreed that blank spaces should be left in the contract, and when the amount had been ascertained and agreed on, it should be entered therein. Thereafter, the purchaser measured the lumber and informed the seller of the amount, and some time later the seller made another inventory, and reported the amount to his attorney, who had the contract, and the attorney at the request of the seller, inserted therein the amount of his measurement, which was larger than that found by the purchaser. It appeared that there were several piles of lumber which the purchaser did not count, and the seller understood that the purchaser intended that he should finish the estimate, and then enter the amount. The seller's act was not such a willful alteration of the contract as would render it void.

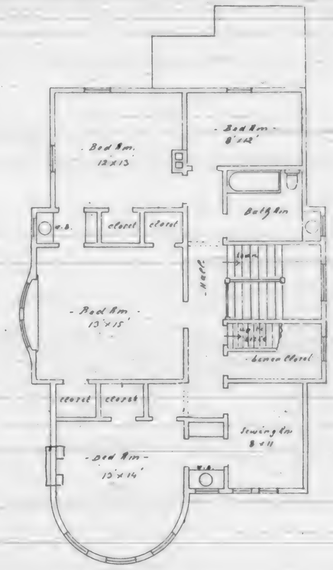
Cline v. Goodale, Supreme Court of Ore. 31 Pac. Rep. 956, 333.

WHEN CONTRACTORS' SURETIES ARE NOT LIABLE.—The lien of a material man for materials furnished certain building contractors, by him, cannot be enforced against persons who entered into the original building contract merely as sureties that the contractor would turn over the building to the owner when complete, free from liens; the material also being charged to the contractors, and furnished solely on their credit. Lien notices must be recorded or filed for record; and where a notice was filed which was invalid, because there was no notarial seal attached to the affidavit thereto, no subsequent proof could be made as to any material fact to render such notice valid, and make it relate back to the time it was filed. Where parties enter into a trial on the merits of the case, without any objection, or demand to have the case tried by a jury, they cannot appeal or raise such objection.

Stetson and Post Mill Co. v. McDonald, Supreme Court of Wash. 32 Pac. Rep. 108.

CITIES CANNOT DESTROY WOODEN BUILDINGS WITHOUT PROCESS OF LAW.—It is not a part of the functions of a city government to enforce the terms of an agreement by forcible measures without process of law. So where a wooden building is maintained in defiance of a city ordinance and in derogation of the terms of the permit granted by the city for its erection, the city government has no power to enforce the terms of the permit by destroying the building without process of law, and a restraining order will be granted the owner until the final hearing and determination of the cause.

Northern Pac. R. R. Co. v. City of Spokane, U. S. Circuit Court, Washington, 52 Feb. Rep. 428, 103.



Second Floor

PLAN OF COUNTRY RESIDENCE.

Notes & Comments.

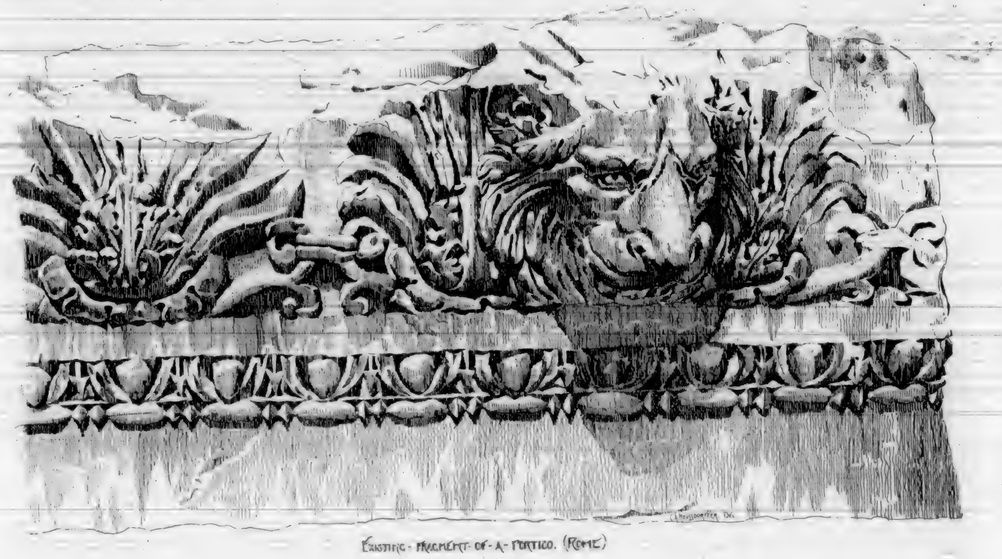
The State of Washington is to have a Capital Building to be erected at Olympia. The last legislature passed the bill which Governor McGraw has recently signed.

The Santa Rosa Board of Education have called an election for April 29th, to vote on the proposition to issue bonds for $30,000, for school purposes. It is proposed to build new school buildings.

The orange and banana fiend is now getting in his work on pavements. Now is the time for the Supervisors to make it a misdemeanor to do such.

New and valuable deposits of onyx and opals have been recently discovered near Colfax. The onyx is reported to be of a varied and rich color, and large blocks free from seams may be taken out.

The auger that bores a square hole consists of a screw auger in a square tube, the corners of which are sharpened from within, and as the auger advances, pressure on the tube cuts the hole round.



EXISTING - FRAGMENT OF A PORTICO. (ROME)

BUSINESS MOSAICS.

Commercial Fire Dispatch Co.—This is a new convenience for the commercial men, bankers and manufacturers, though as it has been established and in successful operation for the last three years it can hardly be called new. The city has been districted in such a manner that they are enabled, by their efficient messengers to notify their subscribers of a fire within a few moments after the alarm is given. At the main office of the company, 61 Flood Building, details of the workings will be given.

A bridge is to be built across the Sacramento river, near Anderson, for the Shasta railroad.

Mr. J. J. Jones, the genial manager of the Westminster Slate Company is in the city at the present time. Since his arrival here he has sold several hundred squares of slate to the principal roofers here and has convinced them of the superior quality of the Westminster Slate and the facilities for the prompt delivery of orders. Further information and particulars can be had of Mr. W. A. Jones who is the local agent for the company.

A. H. Johnson's Automatic Perspective Machine has grown to be a necessity in the office of the architectural draughtman. By the use of it much time and labor is saved and there is no possibility of making mistakes. The construction of this machine is exceedingly ingenious and it accomplishes a marvelous amount of work and is highly recommended by all who have used it.

Chicago City Council has passed an ordinance limiting the height of buildings to 130 feet.

The Sturts Burglar Alarm is superior to all other alarms on account of the simplicity of its construction. New devices are hard to introduce but this alarm having merit will undoubtedly make its way to the front ranks the more it becomes generally known. For further particulars apply at the office of the company, room 15, Thurlow Block, San Francisco.

Messrs, Coppieters & Mockel, manufacturers of Art and Metal novelties wish to call the attention of our readers to their advertisement on page vii.

Fifty-one metals are now known to exist; four hundred years ago, only seven were known.

The Joseph Dixon Crucible Co. has at last been awarded space in the Columbian Exposition—a space 25x28 feet in the Mines Building for a general exhibit of graphite productions such as crucibles, lubricating graphite, graphite axle grease, plumbago facings, graphite machine and railway grease, Dixon's stove polish, silica-graphite paint, core wash, electro-typing graphite, graphite cylinder oil, graphite specialties for electrical and other work, etc.

The cost of the Capitol at Washington has exceeded $30,000,000.

A new glazed tile for partitions, etc., has been put on the Market by Messrs. Gladding, McBean & Co., the well known manufacturers of terra-cotta work for buildings. These partition tiles are glazed on both faces and when set in cement will form a wall having all the desirable qualities as a fire-proof or sanitary partition. This firm also makes a superior quality of glazed bricks, which improvement will recommend them for use in many places. For foundations, setting and backing for kitchen ranges their superiority over those in common use is at once apparent.

The Mott Iron Works still lead in their specialties. See advertisement on page v.

At the Photographer's.—"One more question, sir, before you begin." "Well madam?" "Is it possible to distinguish real stones from false ones on the photo?"—*Wilson's Photographic Magazine.*

If you are in need of rubber, corrugated matting, hose reels or any kind of fire protective supplies call on Frank McAllister, No. 24 Beale street.

A new sleeping car has a space between the sections to allow the occupant of the upper berth to get in by the end and avoid disturbing any one in the lower berth.

Inlaid Floors.—Messrs. Kenney & Wells, 422 Sutter street are the coast agents of J. W. Boughton's Parquet Floors, Wood Carpets and Wainscoting, which have won such an enviable reputation throughout the country. Mr. Boughton began manufacturing Inlaid Floors over twenty-five years ago and now has the largest and most complete factory in the world.

Besides floors, Messrs. Kenney & Wells carry a large line of Mirrors, Frames, Pictures, and manufacture Fret work and Grills. They have lately been awarded all the inlaid floors in the Mutual Life Insurance Co's. building corner Sansome and California street. Branch office 408 and 410 Twelfth street, Oakland.

CITY BUILDING NEWS.

Alcazar Theatre. An electric elevator; owner, M. H. De Young; architect, Wm. Patton; contractors, Otis Bros.; signed, March 21; filed, March 28; cost $5,000.

Bay, Powell and Mason. All work to build; owner, A. Meringo; architect, W. H. Bayliss; contractor, W. N. Nelson; signed, March 28; filed, March 29; cost $2,343.

Baker near Washington. To build; owner, J. A. Hosmer; contractor, Phillip Rive; signed, April 10; filed, April 10; cost $2,925.

Broderick near Jackson. Carpenter, Mason and plastering; owner, E. P. Paddock; architects, Smith & Freeman; contractor, Jas. Mix; signed, March 4; filed, March 7; cost $5,785.

Butte and York. Two-story frame; owner, Cornelius Fagan; architects, Laver & Mullaney; contractor, H. P. Conrady; signed, March 8; filed, March 9; cost $3,200.

Broadway near Van Ness. Alterations to a two-story house; owner, Mary E. Leonard; architect, E. A. Herman; contractor, Joe Ogle; signed, March 15; filed, March 16; cost $2,315.

Broadway near Laguna. Three-story frame; owner, Jane C. Burnett; contractor, S. C. Bozzell; signed, April 1; filed, April 6; cost $3,000.

California and Powell. Grading and concrete work; owner, F. L. Parker; architect, G. A. Boardwell; contractor, W. R. Patterson; signed, March 10; filed, March 10; cost $2,075.

California near Webb. Alterations, etc., to bank building; owner, San Francisco Saving Union; architect, Wm. Curlett, contractors, Smille Bros.; signed, March 16; filed, March 16; cost $178,890.

California and Powell. To build; owner, F. L. Parker; architect, Geo. A. Boardwell; contractor, J. J. Boyle; signed, April 6; filed, April 7; cost $10,240.

California and Webb. Taking down old walls, all excavations, brick, terra-cotta, cutting openings for windows, resetting vaults, etc.; orig-contractors, Smille Bros.; architect, Wm. Curlett; sub-contractor, R. Mitchell; signed, April 7; filed, April 8; cost $39,750.

Church near Ridley. One-story and basement; owner, E. F. Leonard; contractor, Jas. Campbell; signed, April 7; filed, April 7; cost $2,030.

Clay street, No. 409. Alterations and additions; owner, Estate of Agnes Bowie; architects, Mathison & Howard; contractor, W. I. Forde; signed, March 27; filed, March 28; cost $1,655.

Devisadero near California. Two-story frame; owner, M. Spiro; architect, P. A. Sioli; contractors, Wheeler & Wariner; signed, March 7; filed, March 13; cost $4,890.

Eddy near Scott. Frame building; owner, R. C. Dawes; architect, Jno. Marquis; contractor, Jno. Strand; signed; March 2; filed, March 6; cost $3,035.

Eighth and Brannan. One-story brick warehouse; owner, Alvinza Hayward; architects, Percy & Hamilton; contractor, Jno. McCarthy; signed, March 15; filed, March 18; cost $19,684.

Eleventh and Bowie Ave. To build; owner, Patrick McTamney; architect, John T. Kidd; contractor, W. E. Bailey; signed, March 3; filed, March 4; cost $1,445.

Eleventh Ave. near Pt. Lobos Ave. One-story cottage; owner, Mich'l. D. Williams; contractor, Nelson & Marshall; signed, March 21; filed, March 23; cost $1,400.

Ellis and Larkin. To build; owner, Cath Hennebery; contractor, Houston Bros. signed, March 15; filed, March 20; cost $5,820.

Ellis and Webster. Additions to house; owner, Metha Rohe; contractors, Cook & Pattonson; signed, March 20; filed, March 21; cost $1,400.

Ellis near Polk. Alterations; owner, Philip Hessler; architect, Chas. M. Rosseau; contractor, L. B. Schmid; signed, April 6; filed, April 6; cost $1,175.

Ellis near Mason. Grading, supporting, underpinning all adjoining buildings, concrete stone and brickwork; orig-contractors, Mahoney Bros.; owners, Y. M. Christian Assn.; architect, A. Page Brown; sub-contractors, McGowan & Butler; signed, April 8; filed, April 10; cost $50,720.

Eugenia near Mission. Two-story frame; owner, L. G. Fitzgerald; architect, Oliver Everett; contractors, Lundy & Gillogley; signed, March 21; filed, March 21; cost $1,570.

Fell and Masonic Ave. To build; owner, M. B. Sturges; architects, Salfield & Kohlberg; contractor, Wm. Pluns; signed, March 3; filed, March 8; cost $4,225.

Fell near Lyon. To build; owner Isador Zellerbach; architect, A. J. Barnett; contractor, Jno. Ogle; signed, March 22; filed, March 24; cost $10,000.

Folsom near 17th. Two-story frame; owner, M. Sliscovich; architect, C. E. Corrigan; contractors, W. and C. L. Hinkle; signed, March 18; filed, March 27; cost $2,673.

Fulton near Lyon. To build; owner, Howard Morton; contractor, W. W. Rednall; signed, April 5; filed, April 8; cost $3,100.

Geary near Laguna. Alterations and additions; owner, M. De Smith; contractors, Godin & Beaudet; signed, March 21; filed, March 23; cost $1,237.

Guerrero near Fifteenth. To build; owner, Sophie Mendel; architects, Martens & Coffee; contractor, F. Weinoechl; signed, Feb. 20; filed, March 4; cost $3,500.

Guerrero near Nineteenth. Three-story frame; owner, Fred Meyer; architect, C. I. Havens; contractor, Robert Currie; signed, March 2; filed, March 4; cost $8,149.

Hayes near Lyon. Two-story frame; owner, M. McGowan; architects, Copeland & Pierce; contractors, Towle & Broadwell; signed, March4; filed, March 8; cost $1,393.

Hayes near Lyons. Carpenter work; owner, M. McGowan; architects, Copeland & Pierce; contractor, Geo. Healing; filed, March 8; signed, March 4; cost $1,400.

Hayes near Webster. Carpenter work; owner, D. Ross; architect, J. F. Kenna; contractor, T. W. Arnold; signed, March 23; filed, March 25; cost $3,720.

Hayes near Webster. Carpenter work of a two-story flat; owner, D. Ross; architect, J. F. Kenna; contractor, T. W. Arnold; signed, March 23; filed, March 25; cost $2,250.

Harrison and 1st. Alterations and repairs; owner, Geo. M. Aherns; architect, H. Geilfuss; contractor, F. Klatt; signed, March 10; filed, March 11; cost $1,330.

Harrison near 24th. To build; owner, G. A. Gaetcke; contractor, Caspar Zwierlien; signed, April 6; filed, April 8; cost $2,100.

Howard near Fourteenth. Alterations and additions; owner, A. W. Bode; architect, Chas. M. Rousseau; contractor, John Miron; signed, April 4; filed, April 6; cost $2,800.

Howard near Valencia. Two-story frame; owner, Jno. F. Boyd; architects, B. McDougall & Son; contractors, P. J. & M. Brennan; signed, March 16; filed, March 21; cost $17,575.

Jones near Geary. To build; owner, Geo. W. Morgan; architect, W. H. Armitage; contractor, Wm. J. Field; signed, March 18; filed, March 20; cost $7,100.

Kearny near California. Wrought iron work; four-story brick; owner, E. L. Heuter; architect, H. Geilfuss; contractors, P. H. Jackson & Co.; signed, March 2; filed, March 7; cost $2,200.

Kissling near Twelfth. Two-story frame; owner, Jane T. Dowling; architect, Julius E. Krafft; contractor, Daniel Powers; signed, March 15; filed, March 16; cost $2,110.

Leavenworth near Lombard. One-story frame; owner, F. Ballhaus; contractor, Peter Johnson; signed, April 10; filed, April 10; cost $1,900.

Lombard near Gough. Story and basement; owner, Peter Michelette; architect, C. R. Wilson; contractor, P. Antonelli; signed, March 14; filed, March 15; cost $3,500.

Lyon near Washington. To build; owner, Mrs. M. E. Verleger; architects, Plisis & Moore; contractor, Jas. Geary; signed, March 9; filed, March 22; cost $3,690.

Market near Eighth Street. Plumbing, gas-fitting, etc., and sewer work to four-story brick; owner, Louis Schoenberg; architect; Chas. M. Rousseau; contractors, S. Ickelheimer & Bros.; signed, April 5; filed, April 6; cost $1,025.

Masonic Cemetery. Granite and marble work of a Mausoleum (except cement and concrete work of foundation or floors, etc.); owner, N. W. Cole; architect, Jas. E. Wolfe; contractor, A. McLennan; signed, April 7; filed, April 8; cost $3,719.

McAllister and Devisadero. Two-story frame and attic; owner, H. Braunschweiger; architect, C. W. Kenitzer; contractor, Adam Miller; signed, March 21; filed, March 23; cost $15,300.

McAllister and Devisadero. Brick and iron work; owner, A. Miller; architect, C. W. Kenitzer; contractors, T. Hock & Son; signed, March 23; filed, March 25; cost $2,250.

Mission near 23d. Grading, owner, Emma Mangels; architect, H. Geilfuss; contractor, J. O. Sullivan; signed, March 28; filed, March 29; cost $2,444.

O'Farrell near Jones. All work to build; owner, Alice Pease; architect, T. J. Welsh; contractor, H. Jacks; signed, March 28; filed, March 28; cost $5,850.

O'Farrell near Scott. To build four flats; owner, A. Pastene; architects, Coffey & Lemme; contractors, Mix & Hope; signed, March 6; filed, March 8; cost $2,285.

Oregon and Front. Carpenter work, etc.; to add two stories; owner, Jas. G. Fair; architect, H. A. Schulze; contractor, J. B. Gonyeau; signed, March 7; filed, March 22; cost $3,250.

Oregon and Front. Brick, iron and terra-cotta work; owner, Jas. G. Fair; architect, H. A. Schulze, contractors, Riley & Loane; signed, March 7; filed, March 22; cost $3,824.

Post near Grant Ave. Alterations and additions; owners, H. Liebes & Co. architects, John & Balezynski; contractors, Schutte & Krecker; signed, April 4; filed, April 7; cost $18,566.

Post street, No. 2112. Alterations; owner, Wm. Kaiser; architects, Salfield & Kohlberg; contractor, H. Rohling; signed, March 1; filed, March 8; cost $1,530.

Prosper between 16th and 17. Two-story frame; owner, Otto Baumann, contractors' Peterson & Persons; filed, March 10; signed, March 4; cost $2,500.

Sacramento near Devisadero. Two-story frame and moving; owner, A. and R. A. Folsom; contractor, C. H. Wedgwood; signed, March 7; filed, March 9; cost $4,550.

Sacramento near Drumm. All work for a brick building; owner, D. Roth; architect, Townsend & Wyneken; contractor, J. H. Wilson; signed, March 15; filed, March 15; cost $10,550.

Sansome and Washington. Sidewalks, lights, etc.; owner, I. Franks; architects, Wright & Saunders; contractors, Leibert & Hoffman; cost $2,700.

Sixth near Jessie. Iron, steel, brick, cement and artificial stone work, etc. owner, estate of E. L. Goldstein; architect, I. E. Krafft; contractor, R. Ringrose; signed, April 6; filed, April 8; cost $1,364.

Sutter and Mason. Brick and stone; owner, S. Weber; architects, Pissis & Moore; contractors, Riley & Loane; signed, March 8; filed, March 18; cost $23,997.

Sutter and Mason. Iron work; owner, S. Weber; architects, Pissis & Moore; contractors, O'Connell & Lewis; signed, March 15; filed, March 18; cost $14,974.

Scott and Green. All grading; owner, A. C. Soule; architect, Fuller Claflin; contractor, J. E. Carey; signed, Jan. 28; filed, March 18; cost $4,735.

Spruce and Washington. Inside finish; owner, O. D. Baldwin; architect, Samuel Newsom; contractor, West Coast Furniture Co.; signed, March 16; filed, March 18; cost $3,787.

Seventeenth near Valencia. Granite, brick, concrete, etc., to two-story building; owner, Mission Parlor N. S. G. W.; architects, Shea & Shea; contractors, M. Fennell & Son; signed, March 8; filed, March 20; cost $9,187.

Sanchez near 23d. Two-story building; owner, H. D. Matheson; architect, R. H. White; cost $4,500.

Seventeenth near Valencia. Carpenter and iron work; owner, Mission Parlor N. S. G. W.; architects, Shea & Shea; contractor, Wm. W. Ackerson; signed, March 8; filed, March 23; cost $11,432.

Seventeenth near Valencia. Painting; owner, Mission Parlor N. S. G. W.; architects, Shea & Shea; contractor, Ed. Hartman; cost $875.

Seventeenth near Valencia. Plumbing; owner, Mission Parlor N. S. G. W.; architects, Shea & Shea; contractors, Newman & Mills; cost $925.

Seventeenth near Valencia. Three-story frame; owner, Harriet Choynski; architect, Ed. Burns; contractor, Ed. Rohling; signed, March 6; filed, March 6; cost $5,250.

Sharon near 15th. Two-story frame; owners, T. McGrath and wife; architect, Ed. Mooney; contractor, Jno. T. Kidd; signed, March 10; filed, March 13; cost $2,500.

Sharon near 15th. Two-story frame; owners, J. Crampton and wife; architect, Ed. Mooney; contractor, Jno. T. Kidd; signed, March 10; filed, March 14; cost $2,500.

Sacramento St., No. 22 and 27. Alteration and repairs; owner, H. T. Holmes L. Co.; contractor, L. C. Murry & Co.; signed, March 14; filed, March 15; cost $4,187.

Sanchez and 17th. Three-story building; owner, J. J. Hickey; architect, J. J. Clark; contractor, Wm. Linden; signed, March 16; filed, March 16; cost $5,300.

Trent Ave. near 24th. Cottage; owner, Chas. H. Feldbusch; contractor, Wm. Helbing; signed, March 21; filed, March 22; cost $2,000.

Turk and Buchanan. Four three-story frame buildings (except excavations, concrete and cement work); owner, H. F. Fortman; architects, John & Balczynski; contractors, Gray Bros.; signed, April 8; filed, April 8; cost $3,850.

Twenty-first near Dolores. Two-story frame; owners, T. F. Williams and wife; architect, C. H. Skidmore; contractor, Douglass O'Connor; signed, March 7; filed, March 8; cost $3,400.

Vandewater near Mason. Carpenter work on brick work; owner, Fontana & Co.; architect, J. Krafft; contractor, H. Holzenberg; signed, March 2; filed, March 4; cost $9,200.

Vandewater near Mason. Brick and concrete work; owner, Fontana & Co.; architect, J. Krafft; contractor, C. Wagner; signed, March 2; filed, March 4; cost $9,300.

Vallejo near Devisadero. Frame dwelling; owner, E. Rochat; architect, Clinton Day; contractors, Ingerson & Gore; signed, March 1; filed, March 6; cost $9,720.

Vicksburg near 23d. A cottage and stable; owner, Earnest Hoffman; architect, Ed. Vogel; contractor, Wm. Linden; signed, March 27; filed, March 27; cost $1,819.

Walter and Taylor. Three-story frame; owner, C. Brizzolara; architect; E. Deplerre; contractors, L. Cuneo & Co.; signed, March 27; filed, March 28; cost $8,000.

Welgster near Golden Gate Ave. Two-story frame; owner, Geo. Shaefer; architects, John & Balczynski; contractors, Schutt & Krecker; signed, March 27 filed, March 28; cost $5,675.

ALAMEDA COUNTY.

Block A., lot 13. Two-story frame; owner, C. T. Baker; architect, S. A. Bordwell; contractor, J. J. Boyce; signed, March 17; filed, March 22; cost $3,319.

Bowditch near Durant Ave., Berkeley. To build; owner, B. Carrington; contractor, R. Wenk; signed, April 5; filed, April 7; cost $1,600.

Central Ave. near Hight. Five-room cottage; owner, H. H. Hegewald; contractors, Marcuse & Remmel; signed, March 20; filed, March 23; cost $1,525.

C. P. R. R. Right of Way. Two-story frame building; owner, 23d Ave. and 14th L. I. Co.; architects, Colligman & Lassen; contractors, E. P. McGowan and J. Laughlin; signed, Feb. 4; filed, March 15; cost $5,380.

Eighteenth and 9th Ave., Oakland. Two-story frame; owner, E. B. Hill; contractor, C. E. Nichols; signed, March 11; filed, March 15; cost $2,912.

Forty-fourth near Grove. To build; owner J. E. McElarth; contractor, W. M. Campbell; signed, April 5; filed, April 6; cost $1,400.

Grand near Railroad Ave. One-story frame building; owner, J. H. Alders; architect, F. P. Fischer; contractors, D. Straub & Son; signed, March 17; filed, March 21; cost $1,800.

Linden near 24th, Oakland. Six-room cottage; owner, E. A. Beers; contractor, A. D. Coplin; signed, March 17; filed, March 18; cost $1,650.

Moss Tract, block F, lot 7, Brooklyn. To build; owner, T. D. Newson; architects, J. J. & T. J. Newson; contractor, W. H. Higgins; signed, March 29; filed, April 3; cost $1,300.

Ninth near Chestnut, Oakland. Two-story frame; owner, L. Messinax; architects, Townsend & Wyneken; contractor, J. Massoletti; signed, March 14; filed, March 15; cost $2,080.

Pacific near Walnut Ave. Three-story frame; owner, Capt. A. H. McGregor; architect, F. P. Fischer; contractor, D. Straub; signed, March 15; filed, March 15; cost $4,860.

Park near Dayton. Two-story frame; owner, A. W. Ward; architect, T. Claffiin; contractor; R. M. Murray; signed, March 20; filed, March 24; cost $6,668.

Parn near Dayton Ave. Two-story frame; owner, K. D. Field; architect, T. C. Chaplin; contractors, R. Knox & J. G. Cook; signed, March 16; filed, March 20; cost $6,945.

Sixteenth near Fruitvale Ave. Two-story frame; owner, J. A. Jones; contractor, A. W. Pattiani; signed, March 18; filed, March 20; cost $2,963.

Seventh near Henry, Oakland. Alterations and additions; owner, Mrs. M. Walsh; architect, E. Childs; contractor, J. Irwin; signed, Feb. 15; filed, March 15; cost $1,653.50.

Seventh Ave. and 22d street, Oakland. Two-story frame; owner, Mrs. W. B. Smith; architects, Percy & Hamilton; contractor, C. L. Lombard; signed, 18; filed, March 21; cost $2,000.

S end P's Court near R'd Ave. Five-room cottage; owner, C. T. Hoffmann contractors, Marcuse & Remmel; signed, Feb. 10; filed, March 13; cost $1,500.

Taylor and Sixth. Three cottages; owner, J. E. Seigfriend; contractors, Marcuse & Remmel; signed, March 23; filed, March 25; cost $3,615.

Twenty-seventh near 19th Ave., Oakland. One-story frame; owner, H. H. Beach; contractor, A. W. Pattiani; signed, March 22; filed, March 24; cost $2,459.

Thirty-fifth near Grove, Oakland. Two-story frame; owner, K. McDonald; architect, J. J. Clark; contractor, J. R. Robinson; signed, March 14; filed, March 20; cost $2,195.

Twenty-sixth near 14th, Brooklyn. To build; owner, S. Bonsfield; contractor, T. C. Bignami; signed, Feb. 11, filed, March 13; cost $1,552.

Verdi near Railroad Ave. Five-room cottage; owner, F. E. Baker; contractors, Marcuse & Remmel; signed, March 6; filed, March 25; cost $2,325.

Weber near Central Ave. One-story cottage; owner, W. T. Chipman; architect, Wm. Leviston; contractor, R. Christenson; signed, March 21; filed, March 22; cost $2,700.

The California Architect and Building News.

Copyrighted 1893, by the California Architectural Publishing Company.

OFFICE, 408 CALIFORNIA STREET, SAN FRANCISCO, CAL, U. S. A

VOLUME XIV. MAY 20th, 1893. NUMBER 5.

A MONTHLY JOURNAL DEVOTED TO THE ARCHITECTURAL INTERESTS OF THE PACIFIC COAST.

Published on or about the 20th of each month by The California Architectural Publishing Company. The Stockholders being Architects and others interested in the profession.

SUBSCRIPTION TO THE JOURNAL, - $3.00 PER YEAR IN ADVANCE.

THIS journal is prepared to take charge of rendering perspective drawings in pen and ink or color. Charges will depend on size and kind of drawing wanted.

Upon receipt of plan and elevations, with a description of what is wanted, we will submit our estimates for the performance of the work.

A National Gallery of History and Art is a matter of importance to every citizen of America and more especially to students of architecture and art. On Saturday evening the 6th inst, the San Francisco Chapter of the American Institute of Architects, gave a reception in the parlors of the Palace Hotel to Mr. Franklin W. Smith, a retired Boston merchant, who on account of an inherent predilection for architecture, has by constant study and oft repeated visits to European countries familiarized himself with the conditions of the arts and their *needs*, has conceived the magnificent project of a National Museum of History and Art. He proposes to establish at Washington, D. C., a vast series of courts and corridors constructed on the side of Observatory Hill, arranged in historical sequence to contain collections, replicas and original examples of architecture, painting and sculpture, each in its appropriate invironment so that each art and industry may be traced from the beginning to the present day.

These collections and examples to be illustrated by the most notable specimens of art placed in their proper connection and explained in that connection by lecturers who are to be appointed by the various universities, and who shall be selected in accordance with a carefully formulated programme for the benefit of visitors.

This is not a substitution, but a preparation for travel by those who can afford that greater luxury. In a word the proposition embraces a rearranged and improved South Kensington on a vastly enlarged scale.

THE use of cast iron soil and waste pipes for buildings has brought forward the question of the merits of the cast iron pipe with leaded and packed joinings in comparison with the wrought iron pipe with screw joints. It has been contended that cast iron pipes were not sufficiently flexible to prevent breakage by the vibratory motion by wind or other causes.

The article on another page, by J. B. Crockett, descriptive of an experience with a 24-inch cast iron gas main, shows that cast iron pipes where joined with lead packing may be moved and its direction changed to a considerable extent without breaking. The general conditions and results are of especial interest to architects and we invite their attention to the subject.

OUR article in last month's issue of this Journal on "Wiring of Buildings for Electric Lights," was written by an expert in that line and will well repay a careful reading and study of the subject. We cannot ignore the fact that electricity is destined, before many months, to be the coming light; therefore, buildings in course of erection, or in contemplation should be arranged for the most effective work in that line the present state of knowledge will warrant.

SANITARY SCIENCE.

To the Editor of the California Architect:

HAVING occasion to be in Oakland the other day taking in the many improvements and otherwise now going on in that thriving burg, I, being interested in things Architectural, looked over most of the plans of the new school-buildings about to be started there, and was grieved to see that those having the say in the matter have turned back from the ideas most progressive in sanitary science—and have attempted to apply rules appropriate for the Eastern States to buildings here on the Pacific Slope. In, I believe all of these buildings, we find the basement cumbered up with latrines and urinals. The basement, which above all should be kept sweet and clean. The latest and best method, when they have to be placed in the building, is to place all these necessary nuisances on the top of the building so that evil gases may disseminate themselves in the upper atmosphere without having to pass through the stratas of breathable air.

What excuse have we then for men in these latter days who with ample yards and grounds around their buildings persist in placing the latrines in the basement.

This comes in great part from the habit of Californians of having no faith in themselves, but putting their trust in eastern teachers, forgetting that they of all are the worst possible guide for us western people. In the east with their frost and snow they are *compelled* to put their conveniences where they may be kept warm and where their water pipes may not be broken with frost and so that their children may not endanger their noses and ears by having to go out into the death-dealing air. But the conditions here are totally different and generally the rule ought to be to do exactly the opposite to what they do in the east, and you will be more often right than wrong.

In this climate the latrines and urinals of a public building such as a school house should by all odds be kept entirely separate from the occupied building. A covered walk there should be for rainy weather and the edifices devoted to the purpose under consideration ought to be made as architectural as can be. I believe it is, and if not ought to be, a law of Ethics that it is not necessary to emphasize a disagreeable thing for the sake of absolute truth, and there need not be anything about these separate buildings to indicate their use, as all the occupants of the building can be made acquainted with that without it being advertised on the building itself.

Such being the case I cannot conceive of one good reason why these conveniences should be put in the basement especially when the fresh air furnaces are there too, and if there is I would very much like to have it given; and it seems to me that a little more consideration on the part of those having authority might lead them to undo what they have done and start on a more scientific and humanitarian basis.

STROLLER.

AN EXPERIENCE WITH A 24-INCH GAS MAIN.

BY J. B. CROCKETT, MEM. TECH. SOC.

[Read March 8, 1893.]

USUALLY, large engineering operations, such as any class of construction work, are attended with a certain amount of pleasurable anticipation, as the plans are being perfected, and a degree of pardonable pride as the final results are contemplated; but once in a while we are confronted with engineering emergencies that require more skill and watchfulness for successful handling, yet are totally devoid of any of these compensations. This paper deals with one of the last.

What is now known as the Potrero Station of the San Francisco Gas Light Company, was built from 1869 to 1871. It is situated on the Bay Shore, and is bounded by Georgia, Humboldt, and Sierra Streets on the land sides.

The situation of the plant is favorable, with one exception, that the extreme southern part of the City is isolated from the large gas-consuming districts, by water-ways and marshes, extending westward far into the city. To provide an outlet for the gas made at these works, and avoid crossing Channel Creek, or the mud flats which mark the former boundaries of old Mission Bay, it became necessary to lay a twenty-four-inch cast iron main from the works to a point crossing Kentucky street at Solano street, thence over the high hills to the west to Mission street, and thence in a northerly direction down the hill to the marsh at Santa Clara avenue.

The pipe was laid beneath the surface of the marsh on Santa Clara avenue, from Missouri to De Haro streets, a distance of 1,424 feet, then in a northerly direction, 510 feet, to Center street. From Center street the large main enters the heart of the City through Ninth street, and is there connected with the ramification of pipes which supply the city with gas.

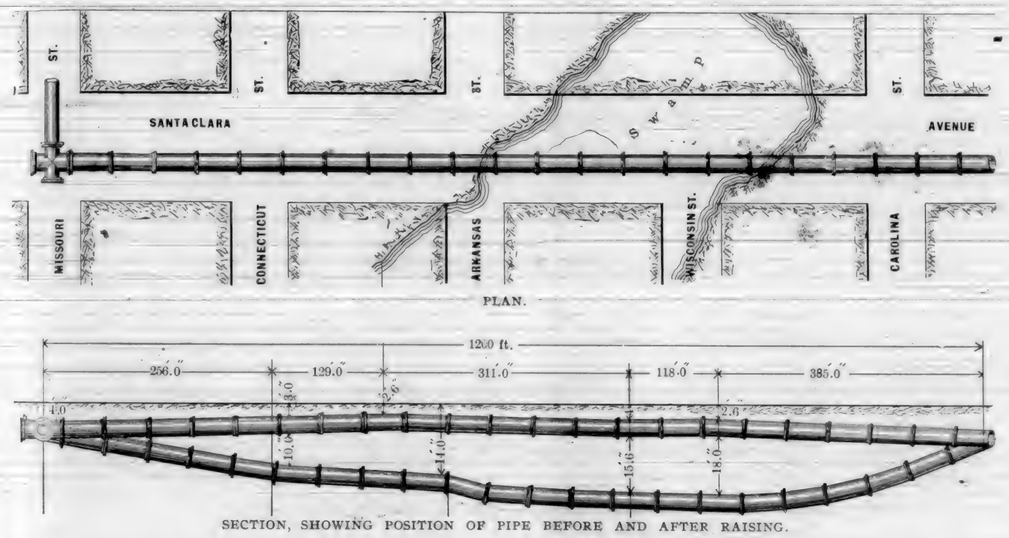
Where the pipe crosses the marsh on Santa Clara avenue, it was laid with about three feet cover of earth, and to all appearances on as good foundation as many other gas mains in the city. At this place the ground was below the official grade, from two feet at the highest, to eighteen feet at the lowest points, but at the time the pipe was laid, no other nor more desirable location was available, nor could the ultimate grading of these streets be anticipated. On a sunny day, with the pipe snugly laid in the marsh, Santa Clara avenue was like a peaceful valley, but after notice was served that the streets in the vicinity were to be graded, it proved to be a veritable "slough of despond." The first notice was the intention to grade Santa Clara avenue from Missouri to Carolina streets, and the intersecting streets. This covered four blocks or about twelve hundred feet of the twenty-four-inch main, and it became necessary to uncover and raise it before the filling was begun.

Before proceeding with a description of the raising of this large pipe, I want to lay stress upon the fact that this pipe

was the main artery of the city's gas supply, which was constantly under pressure, and through which over three-fourths of all the gas supplied by the San Francisco Gas Light Company was drawn. This was previous to the building of the new works at North Beach, and there was no substitute of any kind for it.

On December 16, 1890, work was commenced raising the pipe on Santa Clara avenue, between Mission and Carolina streets. It was necessary to raise the main without cutting or breaking it, and its success depended in a great measure on its flexibility due to lead joints. Had the joints been of cement, as they are almost uniformly made in Eastern cities, the rigidity of pipes and joints would, without doubt, have caused a break, or perhaps many serious breaks, but with about one hundred lead joints, 4¼ inches deep and half an inch thick, it became possible to raise the main without a fracture.

The first section to be raised, weighed about 260,000 pounds, and the method employed in raising it was as



follows: The pipe was first uncovered, the trench extending to the bottom of the main, and at intervals of 12 feet of its entire length, house mover's frames were placed on each side, one above another, to the desired height. A 12x12-inch timber was placed across these tiers of frames, passing over the pipe just behind each joint. Heavy chains were passed around the pipe, back of each heel, and what is known as a two-inch "holder screw," was hooked to each chain and passed through a hole in the timber above. On the upper surface of the timber was an iron washer, and on this rested the large nut on the thread of the holder screw.

After taking up the slack on each chain, a man was detailed with a wrench to each screw, and at a signal from the foreman each man took one turn of the wrench, and the pipe was gradually raised. As the main was raised from the marsh, a gang of men was employed in blocking under it, to prevent its falling in case of the accidental breaking of any part of the lifting machinery, until finally, when it was raised to the desired height, or about three feet below the official grade of the street, the pipe was temporarily supported by house frames. Seven hundred and eighty of these frames, each 2½ feet high, were used in raising and supporting the pipe.

The next step was the permanent support of the pipe previous to the filling of the street. This was done by constructing a series of wooden trestles, five feet wide at the top and twelve feet wide at the bottom. They were made of 8x8-inch uprights with a sill underneath, and a cap at the top of the same dimensions, and braced diagonally by pieces 2x10-inches on each side. After the completion of the trestles, all the other supports, including the house frames used for raising, were removed, and apparently nothing remained to be done but to fill in the street with solid filling. The pipe had been raised without accident of any kind, all the joints had been re-caulked where they had drawn, and the permanent supports were amply strong.

The filling of the street was commenced immediately after the pipe was raised. This was done by taking the rock from the hills east and south of the fill, and transporting it in cars to the dump. This work was done by a contractor for the city.

As fast as the street was filled to grade, a gang of men kept the twenty-four-inch pipe uncovered, and all went well until the fill reached the corner of Santa Clara avenue and Arkansas street, when, on Saturday April 11, 1891, at eleven o'clock P. M., the northerly side of the street began to slide toward the north, carrying the pipe and its supports with it. The main settled four feet and slid to the north three feet, and the wooden trestles were canted over in the direction of the slide.

A gang of men was immediately put to work shovelling the rock and earth away from the trestles to remove the pressure against them, and to distribute the material under the pipe. The following day a number of teams were employed to cart the material from the face of the dump, and to spread it along the line of the pipe, under and on each side of it. The object in thus carting the rock was to distribute evenly the load on the marsh, and gradually raise the whole street to the level of the pipe, instead of keeping up to the street grade, and presenting a steep face at the dump. Carting rock was continued until we had filled in solid under the pipe and had built a cartway about nine feet wide on each side of the pipe, level with the bottom of it. This required the handling of five thousand loads of stone. As the stone was hauled ahead and loaded on the marsh, the street continued to settle, carrying the pipe with it.

Four days after this first trouble, the crossing of Arkansas street commenced to settle very rapidly, and in fifteen minutes the street had gone down four feet. The large body of rock settling in the mud, raised the surface of the

marsh at a point about one hundred feet north of the street, about five feet high, and opened a crevice a foot wide. This was a natural consequence of the displacement of mud by the heavy fill of stone, but why over half of the filled street should slide bodily toward the north, at the same time, and where and when it would bring up were perplexing questions? To ascertain the exact nature of the underlying strata of the marsh, and solve at least one of these problems, we caused soundings to be made in lines ninety-six feet long, extending from south to north, at right-angles to the pipe, by driving a half-inch iron bar into the ground. The crust of the marsh was found to be fairly firm to a depth of three feet, consisting of a sort of marl.

At the northerly side of the street, after passing through the crust, the bar sank into nineteen feet of soft mud, and then reached hard bottom. At the middle of the street the bar went down through seven feet of the same mud, while on the south side there were but two feet and six inches of the mud under the crust of the marsh. The stratum underlying this mud was an extremely hard clay.

These soundings explained to my satisfaction the cause of the body of rock sliding towards the north. The surface of the marsh was nearly level, but the thick body of soft alluvial mud was resting on a subterranean side hill of hard clay, sloping toward the north with a trend of fourteen degrees, and as the rock fill sank into the mud it slid, mud and all, down the slope of the hard bottom.

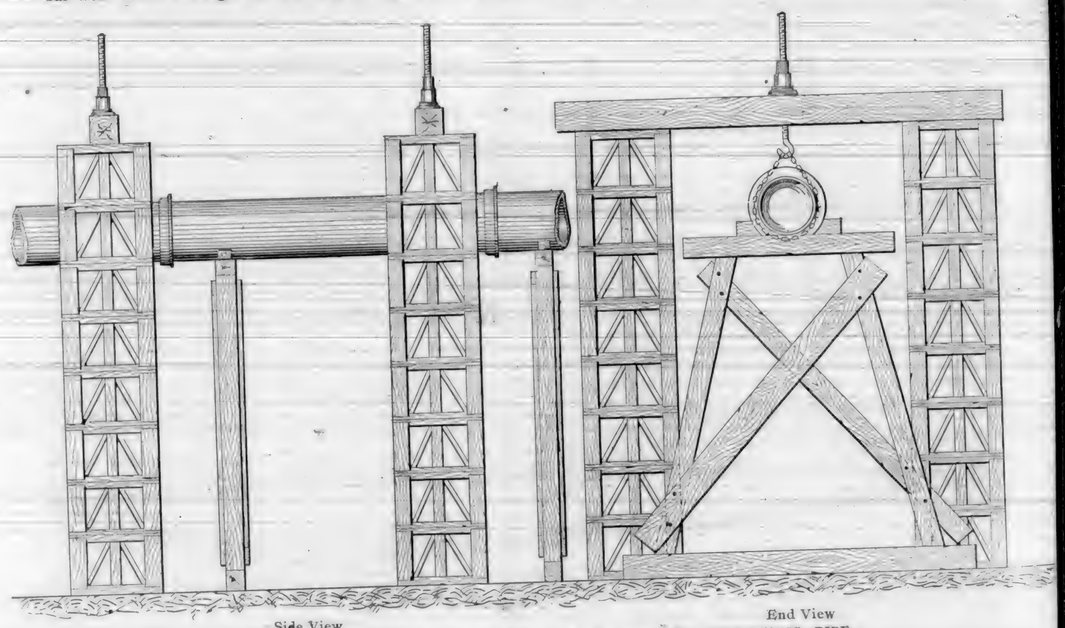
The soundings also explained the sudden and spasmodic settling of the fill. The three feet of firm crust over the marsh offered a resistance to the load of rock piled upon it, until the load was sufficient to overcome the resistance, when the crust broke, letting the entire fill settle from four to five feet at a time.

After the second settling of the pipe it was necessary to resort again to the house frames for raising it, as the wooden trestles had sunk into the marsh and were almost useless. After raising the pipe with screws to the proper height, jack screws were used for forcing it laterally towards the south, back into proper line. By continuous wedging under the pipe, using in all about ten car loads of wooden wedges, we arranged to keep the pipe in its place, until May 1st when another settlement occurred, opening long fissures in the fill, and raising the surface of the marsh to the north about nine feet, and at the same time opening several long cracks nearly two feet wide. This was the most trying period of the whole undertaking, and as a safeguard I laid a line of twenty-inch pipe on the surface of the marsh, south of Santa Clara avenue, and cut the twenty-four-inch pipe between Missouri and Arkansas streets, and at Carolina street, and put in T's twenty-four by twenty.

This was done so that in the event of the construction of the twenty-four-inch main, we could, by making short connections with the twenty-inch main, provide a way to deliver gas to the city temporarily. Fortunately, however, this new line was never used, but its presence was a source of relief.

The last serious settlement occurred on May 15, 1891, when 12x12-inch timbers, thirty feet long, were placed under each length of pipe, back of the joints, and the end of the timber towards the north was blocked up about two feet higher than the south end. With this precaution we were enabled to keep the pipe wedged up in place, although it was a constant source of worry and annoyance, until the rock fill had found a bottom on the hard clay and the street was brought to grade. At the crossing of Arkansas street, which was the worst part of the marsh, the main was raised at the beginning sixteen feet, and the sum of all the settlement at that point, was fourteen feet, that is, the entire fill settled into the marsh a distance of fourteen feet, so that it was necessary to raise the pipe in all, thirty feet, to maintain it at the sixteen-foot level.

The contractor continued filling in, until July 31, 1891, and the average amount of material dumped each day, from May 1st to July 31st, was twenty-three train loads of nine cars each, or about two hundred and seven cubic yards per day. As the contractor completed filling the street to grade, the pipe was kept uncovered, and a 12"x12" timber was placed across each length of pipe, resting on blocking and wedges, chains were passed around the pipe and holder screws were used for sustaining it. For months it was



Side View End View

STRUCTURE SHOWING FIRST MANNER OF LIFTING AND SUPPORTING PIPE.

necessary to keep careful watch of the pipe, and men patrolled its entire length day and night, driving wedges and taking up the slack on the chains, wherever needed. In fact, during all this time Santa Clara avenue became one of the company's telephone stations, and for a while was the one most frequently used.

Finally, in November, 1891, the street had stopped settling, the timbers and screws were removed, and after carefully tamping the earth under the pipe, the trench was filled. Early in October, 1891, notice was received of the intention to grade Santa Clara avenue west from Carolina street, and as the twenty-four-inch main extended west as far as De Haro street, (304 feet) it was necessary to raise it out of the marsh. At De Haro street the pipe turns at a right-angle, and extends to Centre street, (510 feet), and it was necessary to raise the entire 814 feet an average of about eight feet in height.

A pile structure was built to raise and sustain the pipe. Sixteen-inch piles, fifty feet long, were driven through the marsh into the hard clay bottom. These piles were spaced twelve feet apart, and were five feet from the pipe on each side. Ten feet outside of each standard pile a brace pile was driven and sawed off two feet from the ground. On each side of the standard piles, extending down to the brace piles, were diagonal braces 4"x12". Caps 12"x12" were placed over the main, resting on the top of the standard piles, and a screw passed through a hole in the middle of each cap. The pipe was raised as before described.

When the pipe reached the proper grade, waling pieces 4"x12" were bolted on the inside face of the standard piles, and across these were placed two planks 4"x12", on edge, resting on the waling pieces and bolted through the piles. The pipe rested on these 4"x12" cross pieces, and was prevented from rolling by pieces of 4"x 4". The entire wooden structure was securely bolted together.

The standard piles were for raising and permanently supporting the pipe, and the brace piles and the diagonal braces were to withstand any side thrust caused by sliding of the marsh.

One of the difficult features of this piece of work was the bracing of the right-angle in the main, at the corner of Santa Clara avenue and De Haro streets. This was accomplished by driving ten piles around the T at the corner, and by a system of diagonal braces. To prevent the pipe from drawing apart, iron bands were bolted around it at the corner, and these bands connected on each side by rods with turn-buckles.

After the pipe was raised and supported, the 12"x12" caps were removed and the tops of the standard piles were sawed off below the grade of the street. As the street was filled, the pile structure stood the strain of the street settling, but there was little or no lateral thrust, as the clay under the marsh was nearly level at this point, and the fill did not slide.

This piece of work was not subject to any of the unfavorable conditions that so seriously affected the first part of the work. In fact, the method employed to raise the first section would have been successful in raising the second section; but it is doubtful if any wooden structure would have withstood successfully the various forces exerted to overthrow it, at the crossing of Santa Clara avenue and Arkansas street.

[Taken by permission from the transactions of the Technical Society of the Pacific Coast.]

TO ARCHITECTS.

INVITATION to make plans is extended to Architects generally, for a Stone and Brick Building to be erected at De Coto, 26 miles from San Francisco, to be used as an Orphanage for the Masonic Widows' and Orphans' Home.

The Building to have a capacity for the accommodation of one hundred orphans and twenty-five widows.

Cost not to exceed $60,000.

Plans to be submitted to us by July 13, 1893, at 2 P. M., Masonic Temple, San Francisco.

The Board of Trustees reserve the right to reject any or all plans.

For further particulars apply to

G. L. Spear, Chairman,
Jacob Voorsanger,
Albert Hanson.

Spudkins, who has been refused by eleven girls, says he thinks of becoming a photographer, because he is so successful in producing negatives.—*Philadelphia Record.*

ILLUSTRATIONS

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

THE California Home at Glen Ellen, Sonoma County, for the care and training of feeble minded children, is by Messrs. Copeland & Peirce, architects, of this city.

THE Perspective sketch of a residence for Geo. R. Sanderson on Jackson street is by architect C. I. Havens.

THE Japanese M. E. Church to be built on Pine street in this city, is by Maxwell G. Bugbee, architect.

CONCRETE AND TWISTED IRON.

AS USED AT THE STANFORD JR. UNIVERSITY, PALO ALTO, CALIFORNIA.

THE distinctive features of the Stanford Jr. University relate not alone to the course and methods of training, but as well to the character of the buildings which have been erected. The style of architecture is modeled after the low, tile-roofed, abode structures of the mission period. The buildings first erected were of hewn stone, massive, costly and enduring. The later edifices are upon the same general plan, but are also unique and peculiar in mode of construction. They are monolithic, being moulded, walls, floors and roofs of artificial stone or concrete, with the addition of iron rods as an element of supporting strength for the floors.

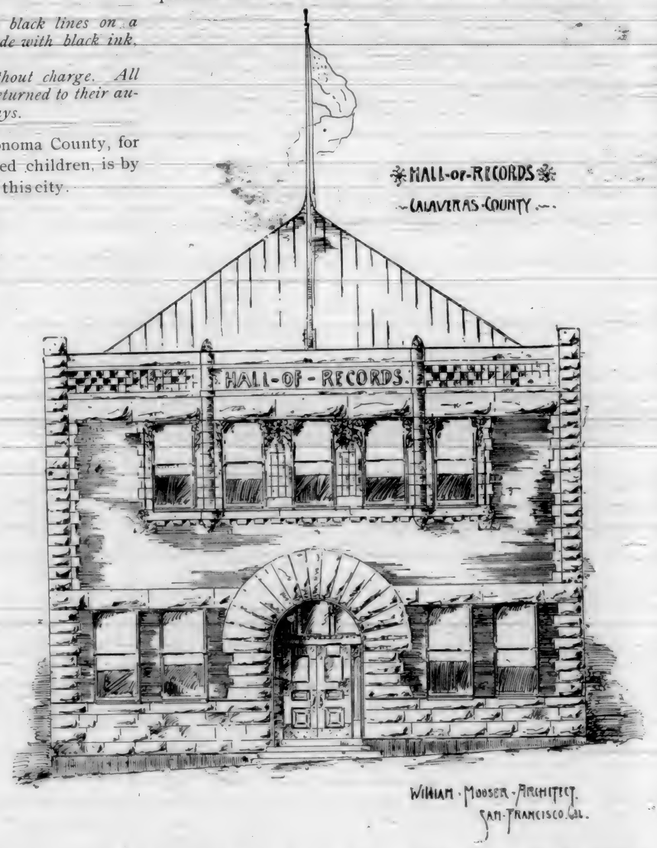
The real problem of successful architecture clearely lies not so much in a choice of material as the proper use of materials common to all structures. Essentially the same elements enter into the construction of all important edifices. The great difference is in the way these are handled; whether the articles in question are used in their natural condition, or shaped and fitted by art, modified by preparation or manufacture, to meet the taste and means of the designer.

Buildings of stone are conceded to be most enduring, and to best resist climatic changes, but they have been the most costly, where the granite or marble has to be transported from the quarry and dressed by hand for use in the walls. The same materials, broken in fragments, and again united by machinery with cement, and utilized in the form of monolithic (single stone) structures of concrete, prove cheaper, and, as use has demonstrated, more enduring, and resist heat better than natural stone.

Such structures are not new, but have heretofore been too massive and imposing. There was needed some device by which floors of stone need not be of excessive weight. In the construction of the new Museum Building and Girls' Dormitory at Palo Alto, this final problem seems to have been solved by a method first introduced upon the bay of San Francisco, which in effect utilizes the principle of the suspension bridge in every separate floor beam.

The floors, though formed of single slabs of artificial stone, are light and graceful in design, though capable of supporting great weight. This requisite strength has been secured by means of bars of twisted iron imbedded within the mass, whereby the tensile strength of the iron—firmly held in place by the surrounding concrete—supports the floor.

The common iron floor beam can be depended upon to the safe limit only of its lateral or transverse strength. Were it possible to use the same weight of iron as a suspension rod,



the safe limit would be the cohesive or tensile strength, which is about three times as great. In other words, a floor can be sustained by a suspension rod one-third the weight of the lateral beam. To break a beam by overloading, it is necessary to separate the particles forming the lower chord of the beam, by tension, or to disintegrate the upper member by compression. Incorporating the twisted bar in the lower portion of the beam, it acts as a suspension rod, and being firmly held at every point, the weight is distributed over the length of the bar. The iron thus imbedded is also safe from corrosion and protected against fire, enduring with the concrete, which hardens as the years pass.

There is yet another feature of large interest here. It has been demonstrated that bars of iron, twisted while cold, and left awhile before use, have their cohesive strength increased fifty per cent. The one-third weight is thus again reduced, showing that less than one-fourth the weight of iron affords equivalent strength.

May not this departure at least indicate somewhat the character of the ideal building of the future?

EACH MAN HAS A SHARE.

WE clip the following from the *Examiner*. N. O. Nelson of St. Louis is President and General Manager of the N. O. Nelson Manufacturing Company of St. Louis, Mo., and Edwardville, Ill. Mr. Nelson became imbued with the idea that the settlement of the differences between employer and employee lay in the direction of co-operation. He arranged to have his theories carried into practice.

"At our works near Edwardville, Ill.," he said, "there are about 450 men employed, and at the end of every quarter each one of them, from the manager down to the smallest apprentice, gets his share of the profits. This averages eight per cent on the wages per annum ever since we put the system into force.

"Lilliane is in every respect a model village. We bought 125 acres of ground, erected substantial buildings for our factories and laid off the town, not with square blocks, but on the park idea, with winding roads and grassy lawns. In our village we have a co-operative store where the men and their families trade. They pay the current retail price for everything purchased, but at the end of every three months the books are balanced and the profits thus shown are divided among the purchasers in proportion to the amounts they have paid in. These dividends amount to from twelve to fifteen per cent a year and are so many amounts saved to the men who work. Besides this we have a hall where school and church are held and a free kindergarten is maintained during several months of the year. We bave free baths, electric lights, modern water works and a circulating library. During the winter there is a course of lectures delivered for the men, and some of the best lecturers of the country are engaged. Last winter we had Edward Everett Hale and men of his class.

"To employees who desire homes we sell them one-third of an acre of ground at two dollars a front foot and erect a cottage for them at cost. This is all paid for in installments, the sum not amounting to more each month than the rent of a cottage in a city.

"Ours is essentially a corporation colony, and the only one of its kind this side of the Atlantic. It makes, I think, a superior class of workingmen, and that it encourages men to apply themselves was shown when we reduced the working hours from ten to nine hours without a reduction of wages and without any decrease in the amount of material turned out."

ALLEGORICAL STATUE FOR THE CALIFORNIA WORLD'S FAIR BUILDING, RUPERT SCHMID, SCULPTOR.

MUNICIPAL LODGING-HOUSES.

THE sanitary section of the New York Academy of Medicine at its meeting, Feb. 1st, discussed the subject of municipal lodging-houses. Since June, 1886, a law has existed authorizing the Commissioners of Charities and Correction to establish such shelters, where a night's lodging and a breakfast might be had, in exchange for work. Any lodger refusing the work might be committed for vagrancy. Dr. Henry E. Crompton made a telling report on the police-station lodging-rooms, usually in basements, where seventy or eighty men may be herded together, in a reeking atmosphere. Mr. Jacob A. Riis gave a chapter from his own experience as a poor immigrant boy. He said:

"I speak of what I know when I speak against these places. Let us have the clean and honest free municipal lodging-houses. Experience in other cities has shown that when such places are established the tramps leave the city. Boston has them, and now we have Boston's tramps. Philadelphia has them, and we have Philadelphia's tramps. The tramp loves the free police lodging-house, but the municipal lodging-house, where he must work for his lodging and breakfast, that he loathes and detests."

Decisive action was determined upon; if necessary, through the grand jury, to compel the commissioners to act, in view of the probability of a return of the cholera next summer.

In this connection it may be well to note that the secretary of the Charity Organization Society of London has recently written a letter to the *London Times*, protesting that the Salvation Army Shelters are doing more harm than good; they underbid the cheap public lodging-houses, and are without sanitary or police inspection. "The shelters are not at all, or in a very minute degree, elevating or regenerating their inmates. They are deceiving men into coming to London with a hope of obtaining employment, which must in most instances be frustrated. They are not preventing pauperism. They are for very many men what it was always anticipated that they must be, portals to the Poor Law. All the misdirected and superficial charitable sentiment that has gone to establish these shelters has, after all, affected nothing, unless it be this—that it has proved once more that philanthropy without discretion is not an ennobling but a degrading force in society."—*The Churchman*.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.
GEO. H. SANDERS, Pres. W. J. CUTHBERTSON, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
C. E. GRUNSKY, Pres. CHARLES D. MARX, Vice-Pres.
OTTO VON GELDERN, Sec. GEO. F. SCHILD, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

THE regular monthly meeting of the San Francisco Chapter of the American Institute of Architects was held on the evening of the 13th inst.

Among the members present was the Honorable John M. Curtis. The subject of legislation on matters of interest and importance to the architectural and building interests, was discussed, and the effect of past and probable results of prospective laws considered from various points of view.

The committee charged with tendering a reception to Mr. Franklin W. Smith, reported that they had successfully fulfilled their duty, and a pleasant evening in the parlor of the Palace Hotel had resulted. Mr. Smith entertaining and instructing his auditors on the subject of the proposed National Museum of History and Art.

COUNTRY RESIDENCE.

A practical hand book relating to the construction and management of steam and power pumping machines by William M. Barr, member American Mechanical Engineers. With upwards of two hundred and sixty engravings, covering every essential detail in pump construction. Philadelphia, I. B. Lippincott Company, 1893.

This volume of nearly 450 pages, printed on excellent paper and illustrated with many drawings. Cannot fail to be of great use to any one contemplating the erection of works for pumping purposes, as it appears to cover the ground completely and the description of the various pumps, with the illustrations make every device understood at a glance. A good index adds greatly to the value of any book, and in this respect nothing more could be desired. Price $5.00.

LOGARITHMIC TABLES by Prof. George William Jones of Cornell University. Fourth edition.

We have here in a convenient form, printed on good paper, with clear type, a book that must commend itself to every engineer, while the student in mathematics will find in the tables a very clear and comprehensive review that cannot fail to interest as well as instruct.

THE FORTNIGHTLY REVIEW—This always welcome magazine makes its appearance for April full of interesting reading, among others, a review of the Poems of Louise Chandler Moulton will particularly please American readers, as it is seldom an English writer will rank our own authors as favorably as this review does, when he compares "The House of Death," as not unworthy of being ranked with the work of Mrs. Browning and Miss Rossetti.

The concluding article upon the "Alleged Dangers of the Manufacture of White Lead" will be sure to interest architects.

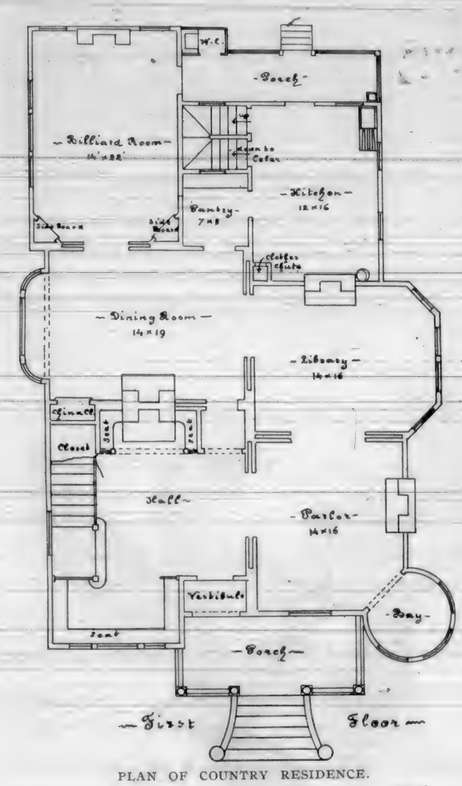
LIPPINCOTT'S Magazine for May contains a complete novel by Rosa Nouchette Carey called "Mrs. Romney". Mrs. Gertrude Atherton supplies a short but appreciative account of the American sculptress Miss Beveridge, while Prof. Haupt discourses on "Colonel Pope and Good Roads".

TENDERS TO BE RECEIVED.

Treasury Department, Office Supervising Architect, Washington, D. C., May 9th, 1893. Sealed proposals will be received at this office until 2 o'clock P. M. on the 13th day of June, 1893, and opened immediately thereafter, for all the labor and materials required for Wharf, Buildings, etc., at the U. S. Quarantine Station, Diamond Point near Port Townsend, in accordance with drawings and specification, copies of which may be had at this office or at the office of the Superintendent at Port Townsend, Washington.

Each bid must be accompanied by a certified check for a sum not less than 2 per cent. of the amount of the proposal. The right is reserved to reject any or all bids and to waive any defect or informality in any bid, if it be deemed in the interest of the Government to do so. All proposals received after the time stated will be returned to the bidders. Proposals must be enclosed in envelopes sealed and marked, "Proposal for Wharf, Buildings, etc., at the U. S. Quarantine Station, Diamond Point near Port Townsend, Washington," and addressed to

Jeremiah O'Rourke,
Supervising Architect.



PLAN OF COUNTRY RESIDENCE.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

STIPULATION AGAINST MECHANICS' LEIN.—A provision in a building contract that the owner will not be in any manner accountable for any loss or damage that may happen to the work, or for any of the materials, and that the contractor shall alone be responsible for all accidents, injuries, damages, or hurt to any person or property, does not prevent the contractor or sub-contractor from filing a lien.

Nice v. Waller, Supreme Court of Penn. 25 At. Rep. 1065, 67.

MECHANICS' LIENS BY MATERIAL MEN.—Where the statute provides that where the building contract is void because it is not recorded, the materials furnished shall be deemed to have been furnished at the personal instance of the owner, and the material man shall have a lien for the value thereof, and materials used in the construction of a flume were furnished before the contract for the construction thereof was recorded, the material man is entitled to a lien against the flume for the value thereof.

Giant Powder Co. v. San Diego Flume Co. Supreme Court of Cal., Feb. 7, 1893, 32 Pac. Rep. 172, 86.

SUFFICIENCY OF LIEN ACCOUNT.—A lien account is sufficiently itemized which describes the windows, sash and all classes of materials sold, with great particularity, except as to price, which appears at the foot of the account, showing the whole amount due at the price agreed upon, since the account contains sufficient information to enable anyone to ascertain whether the price of the materials was reasonable, and whether the materials entered into the construction of the building.

Bardwell v. Anderson Supreme Court of Montana, Feb. 6, 1893, 32 Pac. Rep. 285, 63.

STATUTORY MEANING OF "TRIVIAL IMPERFECTION".—Under the statute which provides that every person, save the original contractor, claiming a lien, must, within thirty days after the "completion" of the building, file his lien, but that any "trivial imperfection" in the construction shall not be deemed such a lack of completion as to prevent the filing of the lien, a lien filed before the doors of a house were hung, the plumbing finished, the closets and bathroom completed, ventilators placed, and mouldings put in, is premature, and cannot be enforced, as such things are not "trivial imperfections" but are necessary to be done to effect a completion of the building.

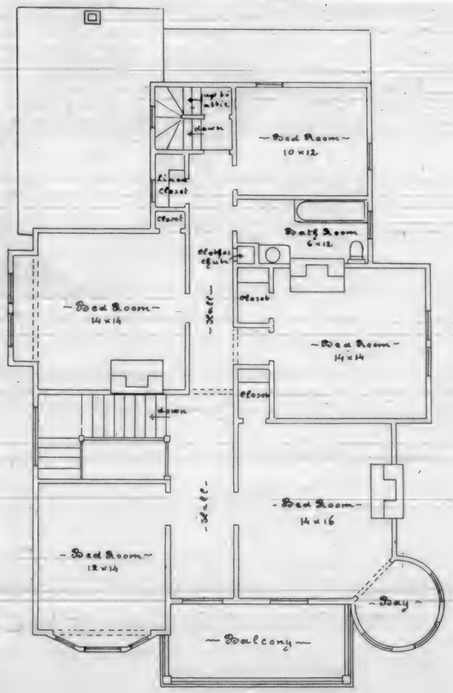
Schallert-Gauahl Lumber Co. v. Sheldon, Supreme Court of Cal. Feb. 9, 1893. 32 Pac. Rep. 235, 109.

MATERIAL FOR ROW OF BUILDINGS IS AS IF FOR ONE BUILDING.—Where material is supplied continuously under one entire contract, to be used in the erection of several buildings on contiguous lots owned by the person to whom it is supplied, and the whole supply is made, the material man has the right to a lien on all the buildings, and need not show how much material was used in each building. The contract in such case is one and relates to the row as an entirety, and not to the particular buildings separately, and the whole row is a building, within the meaning of the law, from being united by the parties in one contract as one general piece of work.

Maryland Brick Co. v. Spilman, Court of Appeals of Maryland, 25 At. Rep. 297, 132.

INSUFFICIENT DESCRIPTION OF PROPERTY SUBJECTED TO LIEN.—Under the statute providing that a notice of a material man's lien shall give a correct description of the property sought to be charged, but that any error or mistake in the description shall not affect the validity of the lien, provided that the property may be identified by the description, a notice of a lien particularly describing lot No. 14, of a certain survey as the lot to be charged, is not sufficient to create a lien on lot No. 13 on the same survey. Nor will the fact that the notice referred to the lot as the lot on which there were certain frame buildings and outhouses, constitute a sufficient identification as such description might apply to any lot on which such buildings stood, even though it appears that there were no buildings on lot No 14, while there were such on No. 13. Where, in an action on an account against the contractor of a building, and to foreclose a material man's lien, against the owner, the complaint states a cause of action on the account a judgment that the claimant take nothing because no cause of action was stated against the owner, will be so modified as to include in its operation only the owner sued.

Goodrich Lumber Co. v. Davie. Supreme Court of Mont. Feb. 6, 1893, 32 Pac. Rep. 282, 213.



PLAN OF COUNTRY RESIDENCE.

BUSINESS MOSAICS.

Cienega Lime in quantities to suit the trade, E. L. Snell, sole agent, 12 Hayes street, also lath, hair, nails, plaster, cement, fire-brick and fire-clay.

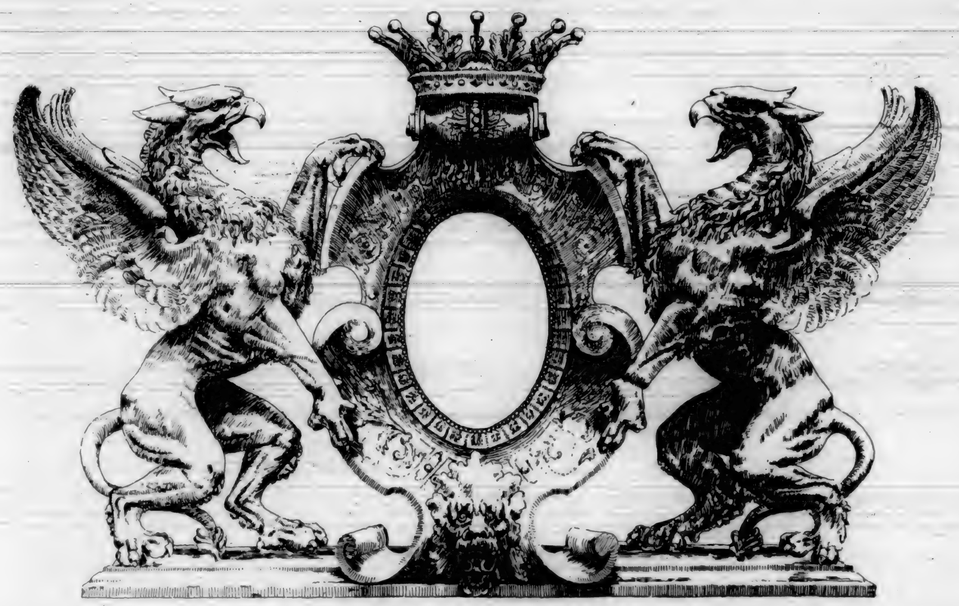
The perpendicularity of a tall monument is affected by the rays of the sun. It leans away from the luminary, owing to the expansion of the side on which the rays fall.

Steam, Hot water and Hot Air Heaters of every description can be had at Geo. H. Tay & Cos'., 610 to 620 Battery street. They guarantee perfect heating combined with economy of fuel. Send for one of their new illustrated catalogues.

The Pullman Sash Balance Company have reason to congratulate themselves upon the success of their Sash Balance in San Francisco when they can announce the business has doubled in this city during the last year, and that the constant demand requires their works to be run night and day. The Crocker residence is fitted with this admirable contrivance and is giving perfect satisfaction.

The following firms in this city carry a good stock of these balances:—G. F. Eberhard & Co., 23 Davis street, as well as Miller, Sloss & Scott, also Dunham, Carrigan & Hayden.

The first wrought-iron pipe was made by Morris, Tasker & Co., Philadelphia, about the year 1841.



Swain - Del

If you have any old silver that needs plating take it to E. G. Denniston of 653 and 655 Mission street, where you will be sure of getting the best of work done and at moderate prices.

Four cent fare has been adopted by all street railways in Cleveland, Ohio, with two exceptions.

Paraffine Paint.—When such good authority as Chief Engineer Holmes endorses anything in this line people are safe who want to preserve their foundations in following such advice. The following from the *Daily Call* speaks for itself:

"Chief Engineer Holmes of the Board of Harbor Commissioners states that the piling at Tiburon prepared with paraffine paint about five years ago is still in a remarkable state of preservation. The method of coating mentioned will be recommended to the board."

Modern Architecture. VISITOR—What is that heavy, gloomy looking building over there? RESIDENT—That is a theatre and pleasure resort. Visitor—And what is the graceful, airy, gothic structure to the right? RESIDENT—That is the jail.—*Chicago News.*

The Hydraulic Press Brick Company of Vallejo, Cal., would respectfully call the attention of the building public to the fact that they are manufacturing a superior article of Press Brick, which they are selling at the same prices as mud brick. Architects and contractors are especially invited to call at the office of the company, 132 Market street, room 16, and examine the brick.

A Pennsylvania inventor has devised a pair of eyeglasses with a mirror mounted so as to reflect objects in the rear of the wearer, but offering no obstacle to direct forward vision through the lens.

The J. L. Mott Iron Works, in this issue on page V, show what they claim is an Indestructable Faucet. The following is an extract relating to same from Minutes of Proceedings of the Institute of Civil Engineers of Great Britain:

"Although modern water-fittings leave much to be desired, they are generally excellent as compared with those of the past; but the desire for cheapness in first cost is still the cause of much waste and subsequent expense. Testing and stamping by the Water Authorities when properly performed, is the only way known to the author of maintaining a sufficiently high standard. The interests of different trades make it practically impossible in large communities to confine the plumbers to the use of fittings of a single type, and, indeed, with one exception, no single type of domestic water-fittings can be said to be manifestly better than another. That exception is certainly a notable one. By the invention of Lord Kelvin there is one practicably imperishable water-tap, on a new but now well-proved principle, without fibrous or organic washer of any kind. These taps are extensively used, though they cannot be produced at the lowest prices; but where introduced, they entirely remove the constant nuisance and cost of leaking washers.

CITY BUILDING NEWS.

Alcazar Building. Adding a fifth story; owner, M. H. De Young; architect, Wm. Patton; contractor, Peter Crickton; signed, March 28; filed, March 30, cost $50,000.

Alabama. Alterations, etc.; owner, Andrea Ricoui; contractors, L. Cuneo & Co.; signed, April 11; filed, April 11; cost $2,450.

Arlington near Mateo. Cottage; owner, Mrs. E. Mengula; contractor, John L. McLachlin; signed, May 1; filed, May 2; cost $1,100.

Army near Sanchez. Hydraulic elevator; owner, S. A. Leslie; architect, S. Hatfield; contractor, J. A. Campbell; signed, March 16; filed, March 16; cost $1,875.

Augusta and Boutwell. Barn, shed and fence; owner, D. W. Ervin; contractor; H. J. Ervin, Jr.; signed, March 29; filed, March 23; cost $1,500.

Baker near Greenwich. Two-story frame; owner, Jos. Merani; architect, E. Depierre; contractor, Jos. Mazzali; signed, April 25; filed, April 28; cost $2,000.

Baker near Washington. To build; owner, J. A. Hosmer; contractor, Philip Rive; signed, April 10; filed, April 10; cost $2,925.

Boyce near Pt. Lobos Ave. To build; owners, Jas. J. and M. Denely; contractor, Wm. Plant; signed, May 3; filed, May 8; cost $1,375.

Broadway near Kearny. Excavations, concrete, brick and chimneys; owner, A. G. Delmonte; architect, E. Depierre; contractor, M. Buzzini; signed, April 1; filed, April 3; cost $1,015.

Broadway near Laguna. To build; owner, Jane C. Burnett; contractor, S. C. Buzzell, signed, April 1; filed, April 6; cost $3,000.

Broadway near Kearny. To build; owners, A. & G. Delmonte and G. Roscelli. architect, E. Depierre; signed, April 20; filed, April 25; cost $8,150.

Bryant near Langton. To build; owner, Emma Lolor; architect, Chas. Geddes; contractor, Todd Boone; signed, April 24; filed, May 2; cost $3,970.

Block near Western Addition. Grading; owner, N. T. Coulson; contractor, Geo. E. Bowers; cost five cents per cubic yard.

Bush and Pierce. Alterations; owner, Julius Van Vliet; contractor, A. J. Kellner; signed, April 28; filed, April 28; cost $1,515.

California and Powell. Two three-story buildings; owner, Frank L. Parker; architect, G. A. Boardwell; contractor, J. J. Boyle; signed, April 6; filed, April 7; cost $10,240.

California and Powell. Painting two three-story frames; owner, Frank L. Parker; architect, Geo. A. Boardwell; contractor, F. L. Poland; signed; April 20; filed, April 20; cost $1,000.

California and Powell. Two three-story buildings; owner, Frank L. Parker, architect, Geo. A. Boardwell; contractor, A. B. Bordwell; signed, April 10; filed, April 10; cost $1,630.

California and Taylor. Masonary and marble work; owner, C. P. Huntington; architect, J. D. Isaacs; contractors, Ruffino & Bianchi; signed, March 30; filed, March 30; cost $1,913.

California and Webb. Tearing down walls, etc.; owner, San Francisco Saving Union; architect, Wm. Curlett; contractor, Robert Mitchell; signed, April 7; filed, April 7; cost $39,750.

Carl near Stanyan. To build; owner, Thomas Lundy; architect, T. J. Welsh; contractor, James J. O'Brien; signed, March 28; filed, March 28; cost $14,900.

Castro near 18th. Two-story frame and stable; owner, H. F. Stolz; architect, H. Gellfuss; contractor, A. Lawson; signed, April 12; filed, April 12; cost $2,669.

Chestnut near Buchanan. Grading; owner, Eliza B. Buckler; contractor, Geo. E. Bowers; cost four cents per cubic foot.

Church near Ridley. A cottage; owner, E. F. Leonard; contractor, Jas. Campbell; signed, April 7; filed, April 7; cost $2,030.

Church near 27th. To build; owner, Wm Swalve; architects, Townsend & Wyneken; signed, April 26; filed, April 28; cost $1,300.

Clay near Cherry. To build; owner, Peter McHugh; architects, Shea & Shea; contractor, Allen McDonald; signed, April 29; filed, May 4; cost $2,100.

Clementina near 9th. Alterations, etc.; owner, John Regan; contractor, John Sandeen; signed, March 21; filed, April 1; cost $1,675.

Devisadero near Vallejo. Two-story and basement; owner, Laura A. Hoeber; architect, C. W. Kenitzer; contractors, Schutte & Krecker; signed, April 24; filed, April 26; cost $7,194.

Douglass near 18th. Two-story frame; owner, Christ Ruhland; contractor, Casper Zwierlein; signed, May 2; filed, May 3; cost $2,800.

Douglass near 22d. One-story and basement; owners, Chas. W. Dammes and wife; architect, Oliver Everett; contractor, D. H. Matheson; signed, April 28; filed, April 26; cost $1,650.

Ellis near Polk. Alterations; owner, Philip Hessler; architect, C. M. Rousseau; contractor, L. B. Schmid; signed, April 6; filed, April 6; cost $1,175.

Ellis near Mason. Grading, brick and stone; owner, Y. M. C. A.; architect, A. Page Brown; contractors, McGowan & Butler; signed, April 8; filed, April 8; cost $50,729.

Erie near Mission. Two-story frame; owner, Mary McAuliff; architect, C. J. Havens; contractor, C. E. Danshee; signed, April 5; filed, April 5; cost $2,800.

Florida near Santa Clara. Two-story frame; owner, Mrs. R. A. Ledgley; contractor, F. W. Kern; signed, April 11; filed, April 11; cost $2,570.

Fourteenth near Sanchez. Two two-story flats and three two-story frame buildings; owner, Henry Arty; architect, C. W. Kenitzer; contractor, Adam Miller; signed, April 24; filed, April 25; cost $4,427.

Fourteenth near Church. Two-story frame; owner, F. W. Kenerieber; architect, H. Gellfuss; contractor, A. Lawson; signed, April 26; filed, April 26; cost $3,700.

Franklin near Fell. Raising and removing three frame buildings; owner, Mrs. C. M. Berger; architect, Oliver Everett; contractor, J. J. O'Brien; signed, May 6; filed, May 6; cost $1,412.

Fulton near Lyon. Two-story frame; owner, Howard Morton; contractor, W. W. Rednell; signed, April 5; filed, April 5; cost $3,100.

Fulton near Scott. Alterations, etc.; owner, Otto Berman; architect, Edw. Burns; contractor, John McCann; signed, April 14; filed, April 17; cost $2,675.

Geary and Gough out to ocean. Laying pipes for salt water; owner, Olympic Salt Water Co.; architect, E. E. Millis; contractors, Williams, Belser & Co.; signed, March 30; filed, April 4; cost $16,032.

Golden Gate Avenue near Buchanan. Three-story frame; owner, Alex McKay; architect, R. H. White; contractor, J. B. McKenzie; signed, March 27; filed, April 1; cost $6,840.

Golden Gate Ave. near Fillmore. Two-story frame; owner, Cathe Wilton; architect, R. H. White; contractor, Thos. Rendell; signed, April 28; filed, April 29; cost $4,350.

Great Highway near B. Engine pit, concrete walls, engine foundation; owner, Olympic Salt Water Co.; architect, D. E. Mellius; contractors, Ramsome & Cushing; signed, May 4; filed, May 8; cost $10,300.

Green and Buchanan. Plastering for six houses; owner, E. A. Sanders; contractor, J. C. Connor; signed, May 2; filed, May 3; cost $1,626.

Green and Buchanan. Brick work; owner, E. A. Sanders; contractor, W. H. Williams; signed, April 6; filed, April 20; cost $1,200.

Haight near Devisadero. Three flats complete; owner, Louis Friedlander; architect, J. F. Kenna; contractors, Currie & Loomer; signed, March 30; filed, March 31; cost $4,597.

Harrison near 24th. To build; owner, Gustave A. Gaetcke; contractor, C. C. Zwierlein; signed, April 6; filed, April 6; cost $2,100.

Hattie near 18th. To build; owner, Jno. J. Reilly; contractor, David Ross; signed, April 28; filed, May 1; cost $1,650.

Howard near 14th. Alterations; owner, A. W. Bode; architect, C. M. Rousseau; contractor, John Miron; signed, April 4; filed, April 6; cost $2,800.

Ivy Avenue near Buchanan. To build; owner, Jane A. Ingalls; architects, Shea & Shea; contractors, Ridout & Rodd; signed, April 24; filed, April 25; cost $2,865.

Jackson near Devisadero. Two-story frame; owner, C. J. Wingerter; architect, A. C. Luitgens; contractor, Wm. Legeier; signed, April 19; filed, April 21; cost $10,915.

Jackson and Octavia. Two-story addition; owner, Emil Sutro; architect, H. Gellfuss; contractors, Schutt & Krecker; signed, May 5; filed, May 5; cost $1,948.

Kisling near 12th. To build; owner, Lewis Cella; architect, M. J. Welsh; contractor, John Sandeen; signed, May 1; filed, May 2; cost $2,315.

Laguna and Chestnut. Grading; owner, Jerome English; contractor, Geo. E. Bowers; signed, April 13; filed, April 18; cost $800.

Leavenworth near Lombard. One-story frame; owner, F. Ballhaus; contractor, Peter Johnson; signed, April 10; filed, April 10; cost $1,500.

Lombard and Webster. Grading; owner, J. M. Wood; architect, C. S. Tilton; contractor, Geo. E. Bowers; signed, April 10; filed, April 18; cost $500.

Main No. 121 and 123. Carpenter, mill, mantels, brick, glass, etc.; owner, Pelton Water Wheel Co.; architect, Samuel Newsom; contractor, Geo. R. Lang; signed, May 2; filed May 3; cost $1,800.

Market and City Hall Ave. One-story brick; owner, John J. O'Farrell; architects, Shea & Shea; contractor, Jas. Cochran; cost $6,000.

Market near 8th. Plumbing a four-story brick; owner, Louis Schoenberg; architect, C. M. Rousseau; contractors, S. Ickelhimer & Bros.; signed, April 5; filed, April 6; cost $1,025.

Market near 8th. Sidewalks and iron four-story brick; owner, Louis Schoenberg; architect, C. M. Rousseau; contractor, Geo. Reichley; signed, April 11; filed, April 11; cost $2,026.

Market near 8th. Four-story brick building; owner, Louis Schoenberg; architect, C. M. Rousseau; contractor, Geo. Reichley; signed, March 29; filed, March 31; cost $14,078.

Market and Ecker. One-story frame; contractors, A. J. McNicoll & Co.; signed, April 10; filed, April 10; cost $2,300.

Mason near Eddy. Carpenter work for six-story brick; owner, S. Silverberg; architects, Salfield & Kohlberg; contractor, W. Pluns; signed, April 12; filed, April 15; cost $11,140.

Mason near Eddy. Iron work; owner, S. Silverberg; architects, Salfield & Kohlberg; contractors, O'Connell & Lewis; signed, April 12; filed, April 15; cost $3,300.

Mason and Eddy. Brick work and mantels; owner, S. Silverberg; architects, Salfield & Kohlberg; contractor, Adam Grant; signed, April 12; filed, April 15; cost $8,500.

Masonic Cemetery. A mausoleum; owner, N. W. Cole; architect, J. E. Wolfe; contractor, A. Maciennan; signed, April 7; filed, 7; cost $3,719.

McAllister near Broderick. Cottage and stable; owner, Louis Gross; architect, E. A. Hermann; contractors, Peterson & Olson; signed, May 4; filed, May 6; cost $2,485.

Mississippi near Solano. Two-story flats; owner, W. S. Young; architect, W. C. Dickerson; contractor, Jno. Sandeen; signed, April 27; filed, April 28; cost $2,625.

Mission near 22d. Two three-story frame; owner, Mrs. E. L. S. Mangels; architect, H. Geilfuss; contractor, F. W. Kern; signed, April 12; filed, April 12; cost $19,370.

Mission and 23d. Painting; Mrs. E. L. S. Mangels; architect, H. Geilfuss; contractor, Aug. Fick; signed, April 12; filed, April 12; cost $2,000.

Mission and 23d. Plumbing; owner, Mrs. E. L. S. Mangels; architect, H. Geilfuss; contractors, Striegel & Ponder; signed, April 12; filed, April 12; cost $3,485.

Mission and 23d. Plastering; owner, Mrs. E. L. S. Mangels; architect, H. Geilfuss; contractor, A. O'Brien; signed, April 12; filed, April 12; cost $2,933.

Mission near 5th. Brickwood, glazing, etc.; owner, Emma Lolor; architect, Chas. Geddes; contractor, Thomas H. Day; signed, April 7; filed, April 29; cost $5,440.

Mission near 5th. Cast iron, dead lights, etc.; owner, Emma Lolor; architect, Chas Geddes; contractors, O'Connell & Lewis; signed, April 7; filed, April 29; cost $2,550.

Mission near 5th. Brick, wood and stone work; owner, Emma Lolor; contractors, Richardson & Gale; signed, April 7; filed, April 29; cost $17,898.

Mission near 5th. Wrought iron work; owner, Emma Lolor; archit ect, Chas Geddes; contractor, P. H. Jackson & Co.; signed, March 31; filed . April 29 cost $2,375.

Montgomery street No. 131. Alterations; owner, J. A. Goell; architect, Oliver Everett; contractor, Ralph Carey; signed, April 21; filed, April 21; cost $2,275.

Montgomery near Leidesdorff. Iron work, etc.; owner, Selby Smelting Works Co.; architect, John Marquis; contractors, J. C. Roberts & Co.; signed, April 24; filed, May 1; cost $1,462.

Moss street, bet. Howard and Folsom; To build; owners, Thomas and Mary A. Gawey; architects, Townsend & Wyneken; contractor, G. Massoletti; signed, April 24; filed, April 25; cost $5,150.

Oak near Fillmore. To build; owner, Adam M. Bratscher; architect, Fred. P. Roblin; contractor, W. A. Muller; signed, May 3; filed, May 4; cost $6,690.

O'Farrell near Webster. Plumbing two three story buildings; owner, C Gebret; architect, W. H. Armitage; contractors, R. Doyle & Son; signed, April 10; filed, April 10; cost $3,548.

O'Farrell near Jones. Plumbing; owner, Alice Pease; architect, T. J. Welsh; contractor, P. F. Ward; signed, April 15; filed, April 17; cost $1,090.

Page near Webster. Two-story frame; owner, Wm. Wertsch; architect, H. Gellfuss; contractor, Henry Rohling; signed, May 3; filed, May 5; cost $4,252.

Page and Schrader. To build, except foundation, plumbing and painting; owner, John Witt; architect, F. P. Rabin; contractor, R. Rechenbach; signed, May 8; filed, May 8; cost $9,800.

Pine near Scott. Two-story frame; owner, P. H. McVey; architects, C. J. Colley & E. S. Lemme; contractors, Jas. Mix and J. W. Hope; signed, April 22; filed, May 2; cost $3,765.

Point Lobos Ave. near 5th. Two-story and basement; owner, J. Marsden; contractor, Chas. Murcell; signed, April 25; filed, April 25; cost $3,225.

Post and Grant Ave. Carpenter work for two stories; owner, H. Liebes & Co.; architects, John & Balczynski; contractors, Schutte & Krecker; signed, April 4; filed, April 7; cost $18,566.

Post near Grant Ave. Stone and terra-cotta work; owners, H. Liebes & Co.; architects, John & Balczynski; contractors, Richardson & Gale; signed, April 26; filed, April 27; cost $5,940.

Post near Dupont. Patent plastering; owners, H. Liebes & Co.; architects, John & Balczynski; contractors, Pacific Patent Plaster Co.; signed, April 22; filed, April 27; cost $3,385.

Post near Dupont. A frame dwelling; owners, H. Liebes & Co.; architects, John & Blaczynski; contractors, Duffy Bros.; signed, April 10; filed, April 10; cost $3,600.

Polk near Green. Two-story frame; owner, Mrs. M. D. Blackstaff; architects, Shea & Shea; contractor, F. W. Kern; signed, April 17; filed, April 19; cost $3,059.

Sacramento near Powell. To build; owner, J. H. Jacoby; architects, Salfield & Kohlberg; contractor, John McLead; signed, April 24; filed, April 25; cost $5,197.

Sacramento near Prospect Place. To build, sub-basement and attic building; owner, The Women's Occidental Board of Foreign Mission of Presbyterian Church; architect, Geo. A. Bordwell; contractor, W. R. Petterson; signed, May 5; filed, May 8; cost $4,012.

Sacramento near Prospect. Carpenter work; owner, The W. O. B. of F. M. of Presbytarian Church; architect. Geo. A. Bordwell; contractor, John J. Boyle; signed, May 5; filed, May 8; cost $9,150.

Sacramento near Prospect. Same as above; plumbing, gas fitting, etc.; contractor, H. Williamson; signed, May 5; filed, May 8; cost $1,028.

Second Ave. near Clement. A cottage; owner, Chas. F. Lundbery; contractor, C. E. Danshee; signed, April 12; filed, April 12; cost $2,119.

Shotwell near 23d. Two-story frame and stable; owner, Jacob Gengnagel; architect, H. Geilfuss; contractor, W. A. Muller; signed, April 19; filed, April 19; cost $3,040.

Sixteenth near Dolores. Millwork complete; owner, R. P. Brennan; architect, T. D. Welsh; contractor, Andrew Wilkie; signed, April 25; filed, May 2; cost $1,740.

Sixth near Jessie. Iron, brick and concrete; owners, E. and E. L. Goldstein; architect, J. E. Kraft; contractor, R. Ringrose; signed, April 6; filed, April 6; cost $1,364.

Steiner near Union. To build; owner, August Lacroix; architect, Wm Mooser; contractor, M. S. Yerxa; signed, March 22; filed, March 31; cost $2,537.

Shotwell and 19th. Lathing, plastering, etc., (for ten tenements); architect, H. T. Bestor; orig-contractor, Henry Behrens; sub-contractor, Daniel Dillon; signed, April 26; filed, April 26; cost $1,350.

Tremont Ave. near Waller. To build; owner, Annie F. Dearborn; architects, B. Dougal & Son; contractor, Ivory Wells; signed, May 3; filed, May 3; cost $2,575.

Turk and Larkin. Carpenter, mill and hardware work for stores and flats; owner, Luning Co.; architects, Coxhead & Coxhead; contractors, Milburn & Gallagher; signed, April 12; filed, May 1; cost $16,881.

Turk and Larkin. Brick, concrete, etc.; owner, Luning Estate Co.; architects, Coxhead & Coxhead; contractors, Richardson & Gale; signed, April 13; filed, April 13; cost $11,950.

Turk and Hyde. Two-story frame; owner, Mrs. M. K. Plummer; contractor, J. T. Grant; signed, April 24; filed, April 29; cost $3,825.

Turk and Buchanan. Four three-story frames; owner, Henry F. Forman; architects, John & Balczynski; contractors, Gray Bros.; signed, April 8; filed, April 8; cost $3,850.

Twentieth near Folsom. To build; architect, W. O. Banks; contractor, Ralph Carey; signed, April 25; filed, May 2; cost $2,585.

Turk and Buchanan. Four three-story frames; owner, Henry F. Forman; architects, John & Balczynski; contractors, Gray Bros.; signed, April 8; filed, April 8; cost $3,850.

Valencia near 17th. To build; owner, Mrs. J. Breen; architect, Jas. P. Brady; contractor, Jas. E. Mooney; signed, April 29; filed, May 2; cost $7,777.

Waller and Shrader. To build; owner, Solomon Cohn; architect, M. J. Welsh; contractor, Brooklyn Planing Mill Co.; signed, April 20; filed, April 20; cost $5,042.

ALAMEDA COUNTY.

Alameda Ave. near Willow. Two-story frame; owner, E. A. and Jennie Vining; contractor, G. W. Pattiani & Co.; signed, April 18; filed, April 20; cost $2,950.

Caroline near Central Ave. Two-buildings, brick work, carpenter work; owner, J. C. Seigfried; contractors, Marcuse & Remmel; signed, April 17; filed, April 20; cost $3,950.

Ceder and Henry, Berkeley. Carpenter work; owner, Clara M. Crichton; contractor, C. T. Lombard; signed, April 22; filed, April 24; cost $2,525.

Chestnut near 8th, Oakland. Two-story; owner, E. F. Fernandez; architect, T. J. Welch; contractor, T. R. Bassett; signed, April 13; filed, April 18; cost $4,400.

Everett near Lincoln Ave. One-story frame, except mantels; owner, J. Knowland; architect, G. A. Bordwell; contractor, C. H. Foster & Son; signed, April 19th; filed, April 20; cost $2,087.

Fallen street, Oakland. To build; owner, Thos. P. Hogan; contractor, C. S. Bannard; signed, April 27; filed, April 27; cost $1,425.

Fifty Associates Tract, lot 9, block B, Oakland. Plumbing, tinning, brickwork, plaster and painting; owner, John Williams; signed, April 17; filed, April 19; cost $1,280.

Linden Vista Terrace, Oakland. Two-story frame; owner, E. A. Heron; contractors, A. W. Pattini & Co.; signed, April 25; filed, April 25; cost $1,900.

Linda Vista Terract. To build; owner, E. A. Heron; contractors, A. W. Pattiani & Co.; signed, April 25; filed, April 25; cost $3,776.

Linda Vista Terrace, Oakland. Two-story frame; owner, E. A. Heron; architect, E. Childs; contractors; W. T. Veitch & Bro.; signed, April 25; filed, April 28; cost $7,088.

Ninth near Harrison, Oakland. To build; owner, C. Terry; contractor, D. S. Brehant; signed, April 15; filed, April 17; cost $6,650.

Rose Ave, near Piedmont Ave., Oakland. To build; owner, D. M. Little; contractor, J. V. Embury; signed, April 17; filed, April 26; cost $1,700.

San Pablo Ave. near 22d, Oakland. To build; owner, J. M. Driscoll; architect, Howard Burns; contractor, P. F. Nelson; signed, April 19; filed, April 19; cost $4,752.

Sixth near Broadway, Oakland. Alterations and additions; owner, H. Davis; architect, E. Childs; contractor, W. H. Butson; signed, April 27; filed, April 28; cost $2,259.

Twelfth near 15th, Oakland. Seveventeen-room two-story building; owner, M. E. Bacon; architect, T. L. Williams; contractor, T. A. Brown; signed, April 11; filed, April 17; cost $3,200.

Twelfth near Webster, Oakland. Three-story brick; owner, N. P. Perrin; architects, J. J. & T. J. Newson; contractor, T. M. McLahlan; signed, April 18; filed, April 21; cost $3,200.

Washington near 11th, Oakland. Carpenter work, etc.; owner, F. W. Schultz; architect, C. Mau; contractors, Herbet & McLeod; signed, April 28; filed, April 28; cost $11,637.

The California Architect and Building News.

Copyrighted 1893, by the California Architectural Publishing Company.

OFFICE, 408 CALIFORNIA STREET, SAN FRANCISCO, CAL., U. S. A.

VOLUME XIV. JUNE 20th, 1893. NUMBER 6.

A MONTHLY JOURNAL DEVOTED TO THE ARCHITECTURAL INTERESTS OF THE PACIFIC COAST.

Published on or about the 20th of each month by The California Architectural Publishing Company. The Stockholders being Architects and others interested in the profession.

SUBSCRIPTION TO THE JOURNAL, - $3.00 PER YEAR IN ADVANCE.

ESTABLISHED 1879. - - - INCORPORATED 1889

NOW IN THE FOURTEENTH YEAR.

W. J. CUTHBERTSON, President. OLIVER EVERETT, Secretary.

ADVERTISING RATES:

Space	*1 Month.*	*3 Months.*	*6 Months.*	*12 Months.*
1 Inch	$ 1 50	$ 4 00	$ 7 50	$ 13 00
3 Inch	4 00	10 00	18 00	35 00
6 Inch	7 50	18 00	32 00	60 00
1 Column	12 50	35 00	65 00	125 00
¼ Page	20 00	57 50	105 00	200 00
1 Page	40 00	110 00	200 00	350 00

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

THIS journal is prepared to take charge of rendering perspective drawings in pen and ink or color. Charges will depend on size and kind of drawing wanted.

Upon receipt of plan and elevations, with a description of what is wanted, we will submit our estimates for the performance of the work.

IN 1867, Frederick Law Olmstead in his report to the committee on outside lands recommended that the panhandle entrance to Golden Gate Park be extended to Market street, and that the blocks of land between Franklin street and Van Ness avenue and extending from Market street to the Bay be converted into a boulevard. This would have created a magnificent shaded drive through the residence parts of the city, increased the value of the adjacent lands enough to, in a great measure, compensate for the cost of the improvement, and at the same time, and most important of all, formed a most effective barrier across the path of a great conflagration which some day will sweep its way, fanned by a westerly wind, from Lone Mountain to the Bay. Such a conflagration was threatened this month, but owing to the fortunate circumstance of their being several vacant lots surrounding the scene of the fire, the department succeeded in confining it within the limit of the three blocks attacked, and the dozen or more buildings burned is the price paid for this warning.

To have carried out the recommendations of Mr. Olmstead at the time they were made, would have been a simpler matter than at present, in view of the comparative small value of the land twenty-five years ago, and the fewer improvements that would have had to be demolished. Even now, it would be true economy, notwithstanding the immense expenses that would have to be incurred, if some such measures could be taken to protect the different sections of the city from the danger of fires starting at distant points, for once let a fire get beyond the control of the department, it will burn its way to the Bay, and we will have passed through an experience like that of Chicago and of Boston. Then regrets will be of no avail; but let us at least hope that if we have not been wise enough to profit by the bitter experience of our sister cities, we will at least have the foresight to lock the stable door after the horse has been stolen, and when our new city is springing from the ashes of the present, that a wiser policy will provide against the obvious dangers of building an entire city of wood without effective precautions against the danger of its total destruction by fire.

THE announcement of the World's Congress of Architects, to be held next August at Chicago, should be a hint to the Architects of this Coast, to take some action without more delay, in order to be well represented at that Congress.

TO ARCHITECTS.

THE Committee that has charge of the erection of the Masonic Widows' and Orphans' Home desire to make public the following additional information governing the competion:

Invitation to make plans is extended to Architects generally for a stone and brick building to be erected at Decoto, twenty-six miles from San Francisco, to be used for the Masonic Widows' and Orphans' Home.

All plans must be delivered at the Masonic Temple, San Francisco, by July 13, 1893, at 2 P. M.

The Board of Trustees will be the sole and exclusive judges of the excellence and suitability of the plans submitted and reserve the right to reject any or all plans; no compensation will be made for rejected plans, and they will be returned to their respective owners after the final decision of the Board of Trustees.

Plans must show one elevation. A longitudinal and transverse section all drawn to the scale of eight feet to one inch.

A perspective view of the building is to be furnished, the scale to be eight feet to one inch; the plane of the picture to be taken at nearest corner of building.

A *bona fide* estimate of the cost of construction must be submitted by the Architect, which must not exceed sixty thousand dollars ($60,000).

The building to have a capacity for the accommodation of one hundred orphans and twenty-five widows.

The plans not to contain a dining-room or kitchen, it being the intention of the Board of Trustees to erect a wooden building for that purpose.

The main building to be so designed as to admit of additions.

The general plans to be drawn in either pencil or ink, all sections hatched, no coloring, but the perspective may be shaded or colored.

For further particulars apply to,

Gustavus L. Spear,
Jacob Voorsanger,
Albert Hansen.

AS an argument in favor of the use of electricity as a native power for traveling cranes may be cited the crane built by the Yale & Towne Manufacturing Company, at the Columbian Exposition. The Machinery Hall is divided in three bays, each covered by an electric traveling crane, the above named crane occupying the central bay. The crane has been in active and constant operation day and night, handling the heavy materials and installing exhibits since the middle of December, 1892, and not only has it done its own work in the most thorough and satisfactory manner, but has been engaged in handling the exhibits for the side bays, pending the starting of the cranes covering those portions. The great success with which this powerful crane has done its work is ample demonstration of the value of the use of this new motive power properly applied to correct design and excellent workmanship, and would seem to conclusively prove that the electric traveling crane, is the crane not only of the future but of the present.—*Engineering Magazine.*

ROCOCO WORK.

STRENGTH OF HORIZONTAL BEAMS.

BY CALVIN BROWN, C. E.

ANY horizontal straight beam, whether of one piece or framed of several pieces, as in a truss, usually called a girder, or compounded of cement, concrete, bricks, etc., and metallic ties or rods, and employed for sustaining a load, is subjected by such load to a force or strain which operates with two distinct results. This is plainly illustrated in the breaking of a stick held by its ends and bent downwards or upwards. If bent downwards the upper portion will be compressed as shown by its bulging in the middle part, while the lower portion will be stretched. If bent upward the reverse of this result will occur, the bulge taking place on the lower surface and the stretching on the upper surface. The following diagram shows these results, in a somewhat exaggerated manner, on a loaded beam supported on its ends and supposed to be loaded at its middle, which position is the one we have here to consider:

FIG. 1.

It will be understood that any load upon the beam acts upon its upper portion with an effort to crush its particles together, this being technically termed the "compressive force," while on the lower position it operates with a tendency to stretch or separate its particles, which accordingly is distinguished as the "tensile force."

These forces extending downward and upward in the beam, reach their operating limit at a longitudinal boundary between its upper and lower surfaces termed the "neutral axis" where of course neither force operates.

The position of the neutral axis has been a subject of much study by the most eminent mathematicians, but its difficulty of determination lies in our want of knowledge of the ratio of compressibility and extensibility in any substance; were the one equal to the other the neutral line

would be in the centre of gravity of the beam; but such equality, so far as experiments have shown, does not exist. Professor George B. Airy, F. R. S. Astronomer Royal, has given with very labored analysis and formulæ perhaps the best theory of the strains in the interior of beams. The following diagrams illustrate by means of curves the directions in which compression and tension act through the beam, according to his theory, with their numerical values, which are seen to be equally balanced at exactly opposite points, and which indicate the application of the theory to a perfectly homogeneous beam, which probably cannot be assumed to practically exist. It will moreover be seen that the intersection of the curves representing the direction of the opposite strains, lies in the centre of the beam thus locating the plane of the neutral axis in that centre.

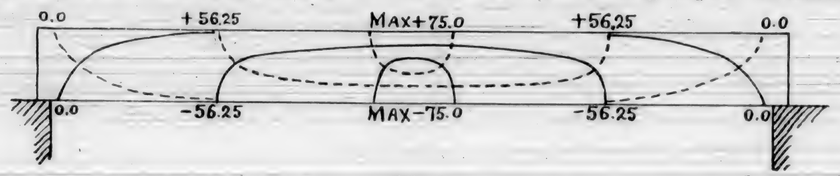

FIG. 2.

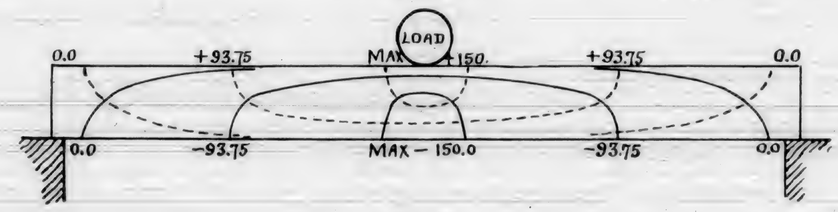

FIG. 3.

The continuous curves indicate the direction of thrust or compression; the dotted lines indicate the direction of pull or tension.
The figures denote the measure of the strain. -|- meaning compression, and — meaning tension.
These diagrams, Figs. 2 and 3, show that the strains upon a beam, indicated by the numerals, originate at the ends where they are 0, to their maximum effect at the middle and of course are thus progressive.

However useful might be an absolute rule for the determination of the position of the neutral axis for ascertaining the strength of a beam, and its proportions for any service required of it, it is not likely to be found by any a priori theory, since no two beam substances are alike in the extent of their resisting powers, nor can any two samples even of the same substance be assumed with certainty to be exactly alike in this respect. Our only resource therefore, for obtaining a guiding rule is by experimenting upon these various substances, ascertaining an average relative indication of their strength values, and combining this element, termed a constant, with the general laws of the strength of beams, which are for transverse pressure or loads.

Directly as the breadth
Directly as the square of the depth
Inversely as the length

or placing these ratios together it is expressed as follows:

$$\frac{\text{breadth} \times \text{depth}^2}{\text{length}}$$

This gives only the general relation of the strength of a beam of any substance to its dimensions and of course is no direct rule for its application—it must therefore be combined with the constant for the especial substance or material of which the beam is composed. Now this constant is the average weight which is found by experiment to break a sample of the material of given dimensions chosen at convenience, and the student may find in any published work on the strength of materials, tables of these constants for every substance employed for beam purposes. If we call this constant *S*, and combine it with the foregoing, we shall get the breaking weight or ultimate strength of the beam.

$$\frac{\text{breadth} \times \text{depth}^2 \times S}{\text{span or length between bearings}} = \text{breaking weight.}$$

Perhaps it may be desirable to express this formula in ordinary language for the merely practical man. "Multiply the breadth of the beam in inches by the square of the depth in inches and this product by the constant found in the tables for the material used, then divide this total product by the length in feet between the supports at the ends—the quotient will be the breaking weight." To elucidate this still further take an actual beam, say 12 inches square and 12 feet between its supports at the end, and of Oregon Pine, whose constant may be assumed at 700.

Then $\frac{12 \times 144 \times 700}{12} = 100{,}800$ pounds or 50 1-5 tons breaking weight, the load being applied to the middle of the beam and not distributed over its length, in which latter case the breaking weight would be double. Of course it will be understood that in practice, only such an allowance from this breaking load must be taken as circumstances may dictate for a safe permanent load, and in this allowance one-half of the weight of the beam should be taken into the account.

In finding the constants above referred to, the ends of the samples experimented upon were left free or loosely upon their supports when the breaking weights were applied—should these ends be fixed, the ratio of strength would be nearly or quite one-half greater, as shown by experiments made by Lieut. Denison of the English service, which fact indicates that in a beam with fixed ends, the action of the compressive and tensile forces are to a certain extent thus resisted.

The above considerations involving the general principles of beams, meaning by this term all structures supported at their ends, or at points by posts, columns or piers, and employed for sustaining loads, imply in their construction and application the observance of certain practical details wherein

their safety and economy as well as strength, are essentially concerned. The history of such structures shows the countless forms in which they have been employed, from the simple stick of timber to the elaborate lofty bridge truss spanning wide rivers and deep canyon, and while it exhibits many splendid examples of scientific construction it also reveals many disastrous failures resulting from various causes in which a want of knowledge of true principles too often appeared.

Leaving out the consideration of a shearing tendency produced at the points of support by a distributed over load, and confining our discussion to the operation of a load concentrated at or near the middle of a beam, we have seen that in a single straight horizontal beam the conditions for sustaining a load consist in the resistance of the material in its upper portion to the compressive action and in that of its lower portion to the tensile or stretching action of the load. To counteract these effects, which is the same thing as giving additional strength to a beam, the truss system is applied; but without undertaking to go into all the details theoretical and practical of this device, since its general construction is well known, it is here only necessary to mention one essential condition of its application not so generally understood as it ought to be, especially by so-called practical builders. The purpose of the truss is to add a tensile resistance to the beam, supposing the compressive resistance to be afforded by its own material intrinsically—therefore in order that as large a portion as possible of the beam should be brought into this particular service, the ends of the truss rods should be secured at points below the plane of the assumed neutral axis and not above it, as is two often seen in practice, from the erroneous supposition that the higher these ends are placed the better would the rods act in a suspensory and therefore more desirable effect. But in such an arrangement it is evident that a lesser portion of the beam is brought into service for compressive resistance to the action of the load, thus losing an essential part of its natural strength and throwing upon the truss rods an unequal share of sustaining duty, and involving larger dimensions for them than would be necessary for a proper adaptation.

The following diagram, Fig. 4, illustrates the principle above set forth, the dotted line showing a vicious, and the full lines a correct position for the ends of the truss rods.

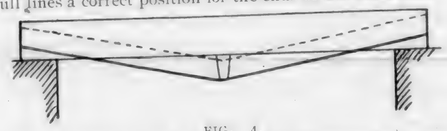

FIG. 4.

The strength given by the most simple method of trussing by iron rods, is shown by Fairbairn to be more than double that of the same sized untrussed beam, depending upon the proper attachment of the rods. It is thus plain that under the law of the strength of a beam being directly as the square of the depth, the truss system obviates the necessity for the employment of such deep and space occupying beams as would be required for the same sustaining power derived from the truss.

It is not the intention in this paper to discuss such beam elements as stiffness or resistance to bending, etc., which are governed by other laws than those above considered, for its purpose is simply a brief and practical exposition of general principles involved in the strength of plain straight beams and other analogous load supporting structures in common use. The discussion of those principles although applicable, will not therefore be here extended to wrought or cast iron or steel beams or to the more complex trussed girders employed for bridges, wide spanned roofs, floors, etc.

Since the felicitous discovery and manufacture of artificial hydraulic cement, most notably the so called Portland Cement, a new development in load bearing structures has taken place, wherein the extraordinary qualities of this material have been utilized to a wide extent in the erection of entire works and in important details of various buildings, such as foundations, walls, floors, etc.. resulting in the grand requisites of economy, durability, strength and efficiency, and an unusual immunity from fire. Bridges of considerable span for railways, acqueducts and ordinary roadways have been successfully constructed with a cheap concrete of this material without the use of any other bond or tie than its own inherent strength, but in these cases, as in the employment of masonry, the arch form with abutments has necessarily to be adopted.

The application of Portland Cement to structures on the straight horizontal beam principle is a comparatively recent practice, extending back about twenty years, more or less, but resulting in that time in a constant progress and mainly through the assiduous study and experiments as well as practical works of Thaddeus Hyatt of New York. It is this system as one of the latest and most important improvements in the construction of buildings which will be now considered, it being understood that although its application is not usual in single or separated beams, in which form however it may be employed, but in solid extended floor or other end and pier supported structures, the same laws and conditions which apply to single beams are operative here.

Applying therefore the same considerations as above noticed, to the case of such cement structures, and considering a single cement beam as involving the same principles existing in a solidly extended and supported work, which is really but a very wide beam, we have first to regard the nature of the material employed, and its necessary combination with other material in order that it may serve its proper functions, which it could not do to any important extent without such reinforcement, except in the arched form as above mentioned.

Thus taking the case of cement beams composed either totally of pure cement mixture or of its conglomeration with other materials, say of sand, gravel, broken stone, etc., constituting a concrete, it is obvious to those acquainted with the granular nature of this composition, that while its compressive resistance may be great enought for all ordinary occasions, yet on account of its comparative brittleness and consequent want of tensile strength, it could not be used for a beam of any considerable length without the application of some means for the compensation of this weaker element. This, therefore, must be supplied in a manner analogous to that of the truss, except that instead of being applied in a bent form and on the outside of the beam, and necessarily connected therewith by end fastenings, it is embedded in the substance of the beam and becomes integral with it.

In Hyatt's system of cement concrete beams this compensation for the natural deficiency of tensile strength, is provided by a series of thin strips or plates of iron or steel embedded in the material of the structure, quite near the bottom, at the place of the maximum tensile strain, such strips being rolled with lateral projections on each side, thus admitting of considerable penetration into the concrete and affording a strong adherence thereto throughout the whole length of the strip or tie, obviating the necessity of

end fastenings as seen in an outside truss rod, and also all tendency of slipping or displacement when the beam is under strain from its load, while at the same time the web or axial part of the strip or tie resists the tensile stretch. In this system it will be understood that the compressive action of the load on the upper portion of the beam is met by the inherent resisting power of the material which from numerous experiments has been found to be from thirty to forty times greater than tensile resistance, depending on the proportion of the cement used in the concrete and the fidelity of workmanship in its mixing and solidifying. Details of manipulation of the concrete might here be given but it is presumed that intelligent workers in this material know the conditions for its proper composition and application.

The strength of beams of concrete as that of other beams, varies according to their dimensions and forms, perfection of workmanship, quality of materials, etc., and upon these elements any degree of efficiency may be obtained. Illustrations of the comparative strength of the simplest form, viz: straight and equal section throughout the length, may be given to show their general adaption for service, especially in many cases where other structures of equal efficacy and economy could not be supplied. Mr. Thaddeus Hyatt, in a published work has given accounts of his experiments made in England in connection with Mr. David Kirkaldy, proprietor of a large testing establishment in London, and author of a work on the strength of various materials. The different samples of beams prepared by Mr. Hyatt, about fifty in number, were tested by this gentlemen who has publicly given his authority for the results.

Without undertaking to exhibit here the numerous cases subjected to trial in these tests, one or two may be selected, not by any means the strongest of the series, but simply as showing the relatively small amount of the cheapest material which was employed for the strength obtained. This was a simple straight equal sectioned rectangular beam, Fig 6, of

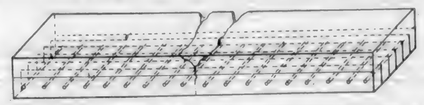

FIG. 5, TIES 4″ WIDE.

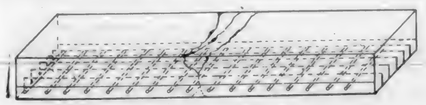

FIG. 6, TIES 2″ WIDE.

12″x 8″ in depth and 6′ long, reinforced longitudinally through its whole length by seven strips of thin iron 2″ wide by 1-16″ thick, through which transversely eighteen wire rods ¼″ diameter were passed, making a sort of grillage; these plates or strips were placed at the bottom of the concrete, their lower edges being exposed; the whole weight of this iron grillage was 21 lbs. The beam was supported at its ends on 6″ bearings, thus having a clear span of 5 feet, and was loaded with 16,418 pounds at its middle before it broke, thus sustaining up to that point a load of 3283 lbs. to the square foot upon the span length.

In comparison with the beam just mentioned and to show the additional strength gained by a wider or deeper iron strip, a similar beam, Fig. 5, in all respects was prepared except that the strips or ties were of double or 4″ width, with the same thickness, viz: 1-16″. This beam, tested in the same way, bore 23,884 lbs. before it broke, thus showing that double the width of the iron ties, and consequently double the total weight of the grillage, gave nearly 50 per cent more strength. It will be here observed, that the extra cost for obtaining this increased strength is only that of 20 lbs. of sheet iron, the labor and the cost of the concrete being the same in both cases.

These two experiments are remarkable as illustrating the principles on which the metal reinforcement to the concrete should be applied, but at the same time it is to be remarked that in piercing the ties for the cross rods they are weakened, and therefore the substitution of corrugated ties as more recently adopted by Mr. Hyatt, affords a more irrefragable bond to the concrete and of course greater strength to the beam with even less cost.

Passing from these early experiments to those more recently made by Mr. P. H. Jackson who has so extensively applied the Hyatt system in this city in various important works, we may adduce one of those executed by him, in further illustration of the strength of concrete beams as resulting from improved methods of construction. Selecting from several of these, as observed by a number of witnesses, among whom was the writer, a structure of the simplest and cheapest form, we have results which in a remarkable degree show the wide capabilities of the system.

The experiment consisted in subjecting an end supported horizontal slab of combined concrete and thin narrow iron ties to a heavy load in order to see what weight would be required to break it down. This slab was 18′ 6″ long by 12′ wide and 9″ uniform thickness, the Hyatt ties being of the corrugated form and their total weight 630 lbs. or about 2 84-100 lbs. per square foot of area. The slab was continuously supported at one end upon a brick wall, and at the other upon two short columns at the corners leaving a clear unsupported space or open span at this end, and also at the sides between the brick wall and the corner columns. A load of 130,000 pounds of pig iron was uniformly distributed upon the unsupported part of the structure, that is between the brick wall and the columns, before it gave way, thus showing a breaking weight of 656 lbs. per square foot of unsustained surface, the breaking being very gradual.

Two other samples varying from each other in the disposition and form of the iron ties, and of somewhat larger area than the above, being of segmental arch construction, with a combination of Hyatt ties and narrow rolled iron girders, were prepared and operated upon by Mr. Jackson, one of them sustaining a weight of 1058 lbs. and the other 1188 lbs. per square foot before breaking—in one of these cases, however, the settlement of one of the supporting columns contributed to the breaking effect. All these samples were supported in the same manner and tested by distributed loads of pig iron.

The intelligent builder will not fail to observe the extended efficiency of concrete structures in the various forms in which they may be made, not only as regards strength and cheapness, but when properly built, in their immunity from fire. The consideration of their fire proof qualities, combined with their smaller cost, shows their adaptation superior to all other systems yet applied to buildings that may be exposed to this source of danger. Wood of course being here out of the question, neither the metals, stone or brick materials, however comparatively secure, can by themselves be economically employed for beams—it is only by their combination with metallic tie rods that they can be

made to serve the purpose, and then in a manner whereby the ties are embedded within the more resistant substance and thus protected from the weakening influence of heat.

The extensive and costly experiments of Mr. Hyatt have proven the efficiency of concrete beams when exposed to the most intense heat, an especial furnace being employed for this test. In these experiments a remarkable coincidence of the law of expansion and contraction of Portland Cement moulded into beam form, with that of iron was discovered, demonstrating the perfect adaptability of the tie for the purpose by its synchronous movement with the substance of the beam and thus always keeping its place. The facility with which these ties can be embedded in the substance of the beam and thus protected from any direct action of fire is obvious.

A peculiarity in regard to the strength of concrete structures remains to be noticed, and this consists in its normal increase with time after the initial set, the maximum not being attained under one or two years, so that whatever may be its degree at first the work never becomes intrinsically weaker by age; of course the judicious builder will see that his work is strong enough at the outset.

ILLUSTRATIONS

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

THE San Francisco Crematory was designed by architects Pissis & Moore. Though not the first one built on this coast, it is the only one easily accessible from San Francisco.

THE confusion caused by the different gauges in use for measuring the thickness of sheet metal, has been a source of annoyance and expense, ever since the illogical and arbitrary standards were fixed.

Both a congressional committee and an association of iron and steel workers are considering the problem, and the best means of solving it.

Oberlin Smith in the *American Machinist* says:—This whole business could be straightened out by competent authority in fifteen minutes, by abolishing all the present gauges, and simply ordering a new one whose numbers would correspond to the number of thousands of inches represented by each size. This would answer perfectly well for all kinds of wire and sheet metal, as well as for paper, glass, leather and other materials. Special gauges might be made resembling in appearance those now used, or anybody preferring it might use the common pocket micrometer guage both of which would however agree.

It is the result of the earnest efforts of a number of people who are firm believers in cremation, as the most logical and best method of disposing of the bodies of the dead. The auditorium in which the services are held, occupies the main floor; the services over the remains are lowered to the floor below, where the incineration may be witnessed by such of the friends or relatives as may desire to be present.

A building for The Citizens' Real Estate & Investment Co., on the corner of 3d and Aldrich streets, Portland, Oregon, is by Reed Bros., architects of this city, cost $250,000.

THE Stockton Theatre at Stockton, Cal., is by Wood, Lovell & Claflin of this city.

A design for a cottage is by C. Swain.

REVOLUTION IN ELECTRIC HEATING.

IN the advance sheets of consular reports for June we have advices concerning a discovery in the use of electricity for heating purposes, which if in simplicity of method and potency of action as thereby announced, is a clean cut advance in practical electricity. The discovery is attributed to the experiments of two Belgian scientists, who recently applied to the German patent office for patents on a new method of heating, melting and refining metals by means of electrical heat. It was determined before granting the patents to make a practical demonstration of the process. The matter was referred to a disinterested electrical expert at Berlin who announced the process a brilliant success. The apparatus as described consists of a glass or porcelain vase, which may be of any size conveniently adapted to the purpose, provided with a lining of lead connected with a strong conductor of positive electricity. The vase is filled to three-fourths its capacity with acidified water. A pair of iron tongs with isolated handles is attached by a flexible conductor to the negative pole of an electrical current generated by an ordinary dynamo. With this simple and comparatively inexpensive equipment the results as claimed are obtained. The current being switched on, a bar of wrought iron or other metal is taken up with the tongs and plunged into the water in the vase. The water begins to boil at the point of contact, and the immersed portion of the iron rises to a red, then to a white heat, emitting a stream of brilliant white light. In but a short time the iron melts and falls off in bubbles and sparks, the heating process being so rapid that neither the water nor the end of the bar held in the tongs are more than slightly warmed, and the current being switched off, the bar, with its submerged end glowing, may be readily held in the naked hand. In the experiments at Berlin it was estimated that fully fifty per cent of the current was directly utilized, whereas the practical limit of such utility is said not to have hitherto exceeded twenty per cent. The explanation of the process lies in the application of the well-known law that resistance to the passage of an electrical current causes heat. The current passing through the tongs and metallic bar into the water decomposes the latter into its two gaseous elements, oxygen and hydrogen. The oxygen is attracted and gathered on the relatively large surface of the lead lining, producing no noticeable results. The hydrogen, on the other hand, gathers around the immersed portion of the iron bar, which is immediately enclosed with a jacket of hydrogen, which, being a bad conductor of electricity, creates a resistance to the passage of the current, thus developing the heat causing the submerged bar to glow and melt.

This discovery or process if as reported is as yet in too early a stage to define its practical range, or its real commercial value. As far as experiments have so far been made, in the welding of certain metals the success in that direction is said to promise a revolution in methods. The difficulties at present existing in the electrical welding of metals, such as the government of the electrical furrace, and the disadvantages of impurities in metal are said to be overcome by the newly discovered process. It is further stated that the new method may lead to important results in the hardening and tempering of armor plates and other products of iron and soft steel in which great resistance to penetration or abrasion by friction is required, while preserving the interior tough and fibrous to resist concussion or strain, as in many parts of machinery. Krupp & Co., of Essen, Germany, are experimenting with the new process in the hardening of steel cannon, while this method of producing an intense heat and easily regulated temperature opens up some hitherto impossible achievements in chemistry, as is the production of precious stones by crystalized carbon.

In this, as in the early announcements of all discoveries, there may be much of anticipation to be qualified by atual results, but there can be no question that the facts as reported indicate an interesting deployment of electrical science and research.

FIRE CAUSED BY WATER.

IN two cases destructive fires have been caused by water, says *The Architect and Builder*. In one of these, a flood caused the water to rise high enough in a factory to reach a pile of iron filings. The filings, on contact with the water, oxidized so rapidly that they became intensely heated, and then set fire to the neighboring woodwork, and the building destroyed. In the other case, the water from the engines, during a fire, found its way into a shed containing quicklime, and the heat generated by the slaking of the lime set fire to the shed, and this to other buildings. Quicklime fires, however, are not uncommon. Many vessels carrying quicklime, have probably beem burned by the admission of water to the lime through a trifling leak, and no architect or builder needs be told how intense the heat of slaking lime may be. Glass globes, which act as lenses, often set fires, and it has recently been claimed, on high authority, that the convex glasses used in sidewalk-lights are dangerous, and should be abandoned in favor of lights with flat tops. As the convex glasses receive and transmit much more light than the flat ones, particularly in muddy weather, it seems hard to be obliged to give them up, and perhaps a lens might be made, convex on the outside and concave on the inside, the concavity being equal to or greater than the convexity, so that rays of sunlight would either pass through unchanged in direction, or would be dispersed instead of being concentrated, so as to unite the advantages of the convex form with complete security.

INCIDENT TO THE FAIR.

INVESTIGATING WASHINGTON WOOD.

WHERE is a prize in store for all lovers of forestry and botany who have not yet visited the Washington State Building at the World's Fair. In the midst of the great collection of tree sections, botanical specimens and other exhibits from the woods of the state is a good sized section of highly polished lead pencil cedar, just as fragrant as a new box of pencils. The tree shows a diameter of a little over one foot, and the grain of the wood is even and soft, just such as is best suited for lead pencil wood. This specimen has attracted the attention of Moriz Von Hardtmuth, a pencil maker of Austria, who with the aid of an interpreter, has beem making careful inquiry about the best way to secure a cargo of this wood for shipment to his factories. This particular tree is not very plentiful in the Puget Sound country, but there are a good many groves on the islands comprising the San Juan archipelago. It was at first supposed to belong to the tribe of cypress, and in consequence one of the islands in that famous group was named Cypress Island on account of the beautiful groves of this valuable wood found on its shores.—*Northwestern Lumberman.*

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute of Architects, meets second Friday of each month at 408 California street.

Geo. H. Sanders, Pres. W. J. Cuthbertson, Vice-Pres.
Oliver Everett, Sec. John M. Curtis, Treas.

Technical Society of the Pacific Coast, meets first Friday of each month at Academy of Sciences Building.

C. E. Grunsky, Pres. Charles D. Marx, Vice-Pres.
Otto Von Geldern, Sec. Geo. F. Schilp, Treas.

California Electrical Society, meets the first and third Monday evenings of each month at the Academy of Sciences Building.

Geo. P. Low, Pres. C. O. Poole, Vice-Pres.
Max Caspari, Sec. H. T. Bestor, Treas.

DEADENING FLOORS.

INSTEAD of loading the floor with plaster for the purpose of deadening sound, a method suggested by a writer in one of the French trade papers is to fill in the space between the boarding and the plastering of the ceiling with shavings, which have been first rendered incombustible by dipping them in a tub of thick whitewash. It is a well-known fact that soft substances in closing air spaces form a good non-conductor of sound, and the writer in the paper referred to is of the opinion that shavings so treated will be found of great service, while this incombustibility adds in no small degree to the fire-resising properties of the building. When it is desired to disinfect the space between the floor and the ceiling the shavings are saturated with chloride of zinc or the latter may be added to the lime wash.

$2,500 HOUSE.

The June number of THE ENGINEERING MAGAZINE, still devoted to Industrial Progress, comes to our table so full of good things that our space will not allow us even the mention of tidbits—but refer the reader to the magazine itself.

THE CANADIAN ENGINEER, Vol. 1., No. 1., published at Toronto and Montreal, Canada, is a well printed and well conducted journal, (as far as can be judged by the first number) devoted to the Mechanical Mining and other branches of the Engineering trades. It is thoroughly Canadian in tone, and gives a large amount of Canadian news, relating to the mechanical, mining and manufacturing interest of Canada. We welcome its appearance among our exchanges.

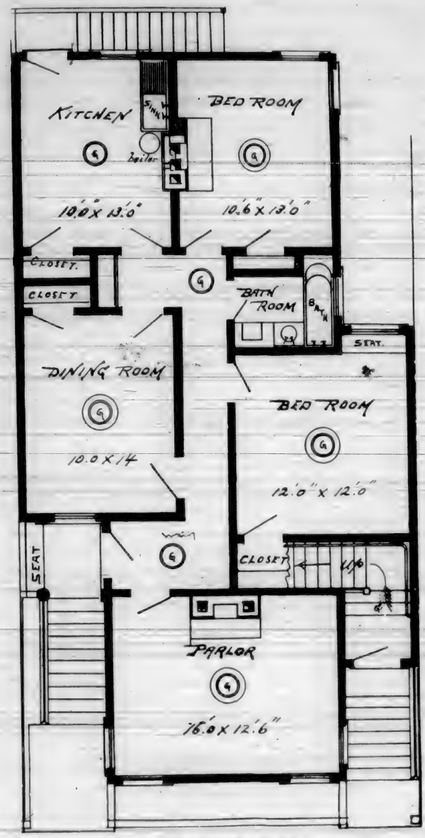
In the WORLD'S FAIR ELECTRICAL ENGINEERING, an illustrated Magazine published in Chicago, will be found in the April number a synoptical index of current Electrical literature which cannot fail to be of interest to the student, as well as to the general public now so generally interested on that subject.

LEND A HAND—A record of progress. Published by J. Stilman Smith & Co., Boston., comes to hand and needs only a list of the editors to be given to insure that there will be found something worth reading. Editors: Edward E. Hale, Mrs. Bernard Whitman, L. E. Dudley, Mary E. Dewey, John Tunis, A. Blair Shaw, M. D., and H. Sidney Everett.

THE SCIENTIFIC AMERICAN comes to hand regularly and is always welcome. According to this authority Tanning by Electricity has been successfully experimented upon in Turin.

THE MECHANICAL NEWS always full of good things in the mechanical line. The June number gives an interesting account of the ingenuity and skill exercised in the imitation of counterfeiting precious stones. Another article on the "Mistaken Idea of Shafting" cannot fail to interest those using power, and if it calls attention in vain, it will be the fault of the millwright who reads and not of the writter of the article.

A false statement is going the rounds of the press to the effect that visitors will not be able to get any water to drink without paying for it. There will be abundance of excellent water free to all who want it. Those who wish to drink mineral spring water, piped to he Exposition grounds from Waukeska, Wis., a hundred miles distant, will have to pay one cent a glass for it.



FIRST FLOOR PLAN.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

Liability of Owner for Negligence of Contractor.—Where an owner contracts for work to be done on his premises, which is lawful in itself, and, if properly done, is not likely to require any act likely to cause injury, he is not liable for the negligence of the contractor in performing the work.

Roemer v. Striker, Superior Court of N. Y. City, Jan. 18, 1893, 21 N. Y. Supp. 1090. 53.

Action for Failure to Erect Partition Wall.—In an exchange of lots, the deed recited that, as part consideration, the buyer and the subsequent owners of the lot conveyed, shall have the right and privilege of uniting with and using the south wall "which may be erected," by the grantors on the south part of their lot adjoining on the north, an action for damages for failure to erect such wall, and an amount of unpaid consideration equal to the agreed value of such privilege, could not be maintained since there is no agreement to erect the wall, and hence no breach of contract.

Money v. Peavey, Supreme Court of Mississippi, 12So. Rep. 334. 106

Commencement of Suit in Mechanic's Lien.—Where a lien statement omits part of the land included in the lien the claimant may correct the mistake by filing a correct statement at any time within the period for filing lien statements. Under the statute which declares that the filing of a petition in a court of record, and suing out process thereon, shall be taken and deemed the commencement of a suit, a suit is begun from the time the petition is filed.

South Mo. Lum. Co. v. Wright, Supreme Court of Mo. 21 S. W. Rep. 811. 81.

Indemnity of Owner for Damages to Third Persons.—A stipulation in a building contract by which the contractors assume liability for any damages that may be done to the property or person of any neighbor or passer-by, during the performance of such work is for the protection of the owner, to save him from claims enforceable against him, and does not give a neighbor a right of action against the contractors for the acts of an independent subcontractor, where the owner would not have been liable had such acts been done by the contractors themselves.

French v. Vix, Court of Common Please of New York City, 21 N. Y. Sup. 1016, Feb. 6, 1893. 97.

Binding Power of Customs.—Where an action for mason work at a specified price per perch, is brought, and the dispute is as to the number of perches contained in the work, a uniform, universal, and notorious custom of measurement among masons is binding, though the result of such measurements is greater then the actual contents.

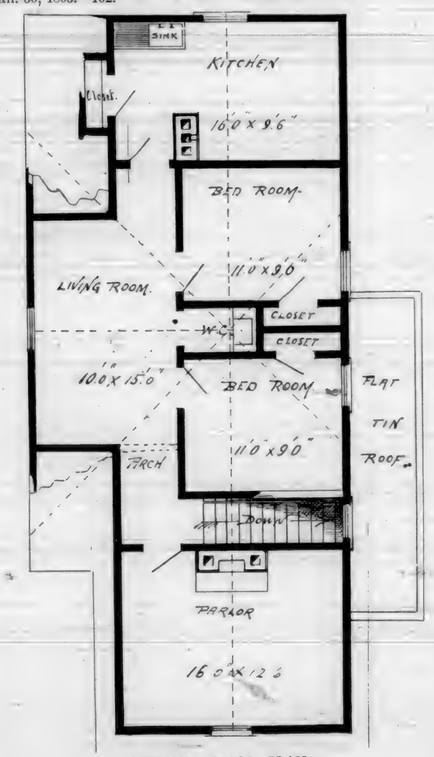
McCullough v. Ashbaidge, Supreme Court of Penn. 26 At. Rep. 10. 59.

Architects' Certificate for Building Contract.—Where a building contract provided that the owner should pay the contractor upon the presentation of certificates, signed by the architect, and that the decision of the architect as to the value of extra or deducted work should be final, and the contractor obtained from the architect a certificate showing the respective values of extra and deducted work, stating the balance due from the owner, which certificate the contractor gave back to the architect, who afterwards refused to give him any further certificate, the contractor was entitled to recover said balance from the owner, although he had not presented him with the certificate.

Arnold v. Bomnique, Supreme Court of Ill. 32 N. E. Rep. 530. 110.

Rights of Lowest Bidder in Building Contract.—A private person, who has asked for bids from contractors on a house that he intends to construct, is not bound to award the contract to the lowest bidder, but he has a right to inquire into the fitness and skill of the bidders to fulfil the contract. The fact that on the opening of the bids the person letting the contract or his architect said to one of the bidders, "You are the lucky man," is merely a recognition of the fact that he is the lowest bidder, and is not equivalent to awarding the contract to him.

Laskie v. Haveltine, Supreme Court of Penn. 25 At. Rep. 886, Jan. 30, 1893. 102.



SECOND FLOOR PLAN.

BUSINESS MOSAICS.

The Misses. Wilson & Kelley of room 45, 6th floor, Mills Building, make a specialty of type writing for architects. Having made a study of this branch of their work they will guarantee satisfaction to their patrons. Do not forget their place, room 45, 6th floor, Mills Building.

Columbus did not make an egg stand on end to confute his opponents. The feat was performed by Bruneleschi, the architect, to silence critics who asked him how he was going to support the dome of the Cathedral of Florence.

We have received from the E. D. Albro Co., manufacturers of veneers at Cincinnati, Ohio, samples of their work in the form of business cards printed on thin veneers, some not thicker than a sheet of note paper; Oak, Maple of various kinds, as well as Birch, making a very pretty souvenir for the World's Columbian Exposition Department of Forestry.

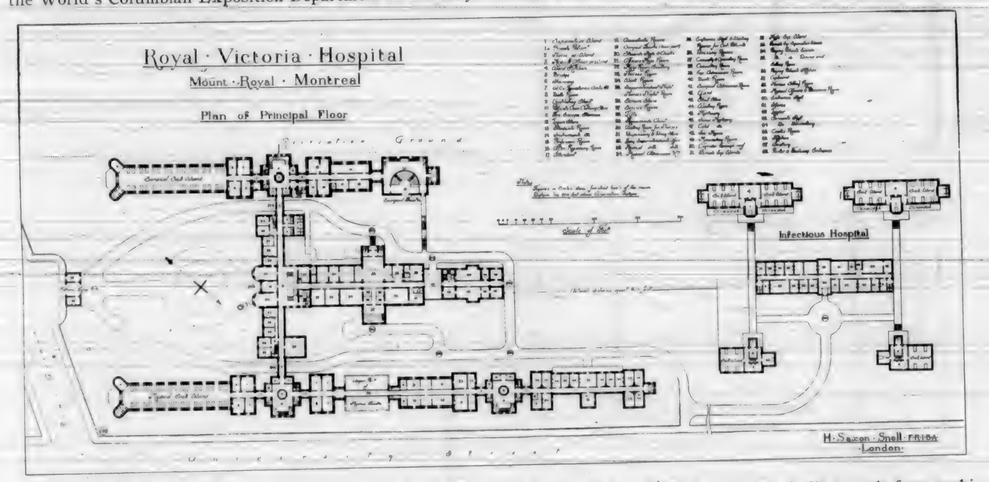
Persons in want of Artificial Stone work should call on George Goodman, 307 Montgomery street. Mr. Goodman's work is well-known for its superior quality, and his name is a sufficient guarantee.

Bilton—"It is a great misuse of terms to say a man is the architect of his own fortune."

CHILTON—"How so?"

Bilton—"When an architect plans a $5,000 house it costs $10,000, but when a man plans to get a $100,000 fortune he usually lands somewhere in the neighborhood of $1,500."—*Tid-Bits.*

The J. L. Mott Iron Works are too well-known to require a work of commendation from us, nevertheless we cannot refrain calling attention to their constant improvements in their line, for which the public should be grateful.



Messrs. Merchant & Co. deserve credit for having placed upon the market a Graduated Tile, which is a valuable addition to their regular "Spanish Metal" tile, and is well adapted for covering all Conical Towers, Circular Roofs, Turrets, Domes, etc., being so graduated in size and form as to fit almost any radius. This tile is manufactured in copper, steel or tin, the latter being painted in imitation of the red clay tile.

Doubtless the manufacture of this tile will do much to encourage the use of a more substantial material for roofing, and in copper we find the ideal material for this purpose.

More Than Plumb. ASSISTANT BUILDING INSPECTOR:—"I am afraid, Mr. Gilligan, you will have to take that front out of your residence,—it's dangerous." MR. GILLIGAN:—"An phat the Devil is the mather with the front; it's the best on the shtreet, and the only one with a bay windy." ASST. INSP'R.:—"But it's not plumb." MR. GALLIGAN: "The Devil ye soy! It's not plumb, is it not? Well I just want to shtate that it's more than plumb. This thing is getting outrageous It was only last week the plumbing inspector was here and made me tear the whole inside out o' the house to have it plumbed according to the modjern idee, and now ye want me to have the outside of it plumbed. Well, I guess not, and ye kin tell Entwisle that I'll see him in——first."

A fine model of Windsor Castle, built to scale from architectural drawings, will be exhibited at the World's Fair. It is believed to be the largest in existence and the only one architecturally correct. The model covers an area of 45x18 feet and stands sixteen feet high. It is built upon a stand, the inside of which is a work of art in saloon decoration.

We are indebted to Mr. Samuel Cabot of Boston, for a handsome Colored Lithograph of his factory, said to be the largest shingle stain work in the world. As specimens of the work done in this line, attention is called to the Forestry Building and several of the State Buildings at the World's Fair in Chicago. To those about to build, the offer is made to send one dozed colored studies upon application to their office in Boston.

With AN EYE TO THE FUTURE.—Mr. Billus was looking over the plans of a new barn he was preparing to build.

MR. BILLUS—"I don't care about having any windows on the side facing the kitchen yard," he said. ARCHITECT—"But you will need them for light." MR. BILLUS—"Light nothing!" "Those windows call for sixty-four panes of glass and I've a boy eight years old! Leave 'em out!"—*Chicago Tribune.*

The highest chimneys in the world are two in Glasgow, one being 468 feet and the other 455 feet, while one near Cologne comes next with a height of 441 feet.

The West Coast Wire Works of 13 and 15 Spear street should not be forgotten by persons in need of wire work of whatever description; Mr. Trowbridge is well and favorably known by architects and builders and any work done by him always gives satisfaction both as to workmanship and price.

A BRIGHT BOY.—OLD GENTLEMEN—"What would you like to be when you grow up?"

BOY—"I'd like to be a bricklayer."

OLD GENTLEMAN—"That's a commendable ambition. Why would you like to be a bricklayer?"

BOY—"'Cause there's so many days when bricklayers can't work."—*Good News.*

A transparent mucilage of great tenacity may be made by mixing rice flour with cold water and letting it simmer gently over the fire.

Ex-President Harrison, whose handwriting is as clear, precise and neat as that of a woman, said, after writing his annual message with a lead pencil, "My thoughts flow more freely from the pencil." General Grant, in writing his important papers, used a Dixon "American Graphite S M" and commended it for its unequaled qualities.

The 40,000 thousand souvenir quarter dollars, which Congress authorized to be minted for the Board of Lady Managers of the World's Fair, will be issued in June. It is thought the ladies will want two dollars each for them, quite a tidy sum.

CITY BUILDING NEWS.

Austin near Franklin. Two-story flat; owner, Mrs. B. McCarty; architects, Townsend & Wyneken; contractors, J. F. Klench & W. Faucher; signed, May 15; filed, May 16; cost $5,000.

Baker and Turk. One-story, basement and attic frame; owner, H. Northrup; architect, Geo. A. Bordwell; contractors, Portor Achinson & Meyer; signed, May 18; filed, May 19; cost $1,693.

Broadway and Steiner. All work to build; owner, M. Van B. Watson; architect, J. B. Mathison; contractor, A. Jackson; signed, May 11; filed, May 11; cost $7,532.

Broadway near Leavenworth. Two, 2-story frame buildings; owners, Jas. and Ann Walsh; architects, Shea & Shea; contractor, Jas. Maguire; signed, May 19; filed, May 22; cost $4,080.

Broderick near Clay. All carpenter work; owners, Mathias Edwards and wife; architect, J. H. Littlefield; contractor, O. E. White; signed, May 19; filed, May 20; cost, $3,757.

California and Jones. Copper work; owner, Geo. Whittell; architects, Coxhead & Coxhead; contractors, Forderer Cornice Works, signed, May 17; filed, May 18; cost $1,970.

California near Drumm. Slating, metal and copper work; owners, Luning Co.; architects, Coxhead & Coxhead; signed, May 19; filed, May 25; cost $2,750.

California near Drumm. Plumbing and gas-fitting; owners, Luning Co.; architects, Coxhead & Coxhead; contractors, Duffey Bros.; signed, April 20; filed, May 15; cost $3,918.

California near Broderick. Two-story frame; owners, Gottell Bros.; architect, C. M. Rousseau; contractors, L. Cuneo & Co.; signed, May 8; filed, May 9; cost $3,150.

California near Hyde. Underpinning, brick, stone, etc., for a 4-story frame; owner, F. Katz; architect, A. C. Lutgens; contractor, E. W. Haaf; signed, May 15; filed, May 16; cost $1,800.

California near Prospect Place. Three flats; owner, Mrs. Caroline Scherr; contractor, W. W. Rednell; signed, May 16; filed, May 16; cost $4,550.

Clara street. Alterations and repairs; owner, John Weir; contractor, J. A. McDonald; signed, May 19; filed, May 20; cost $435.

Clara street No. 223. Alterations and repairs; owner, Jas. L. Fallon; contractor, J. A. McDonald; signed, May 19; filed, May 20; cost $765.

Clarendon Heights, lot 13, block 4. Two-story frame; owner, J. H. Pauls; contractor, A. D. Muller; signed, April 28; filed, May 17; cost $2,510.

Carl and Stanyan. Plumbing, gas-fitting, sewering, etc.; owner, Thomas Lundy; architect, T. J. Welsh; contractors, Duffey Bros.; signed, May 23; filed, June 3; cost $1,898.

Clay near Jones. Excavating, sewering, brick, carpenter, etc.; owner, Cathe Carroll; architect, H. D. Mitchell; contractor, Martin Bapetl; signed, May 22; filed, May 22; cost $4,350.

Day near Sanchez. One-story frame cottage; owners, Gertude and George Samuels; architect, J. B. Wuerscheing; contractors, Home Building Co.; signed, May 20; filed, May 25; cost $1,500.

Drumm, Market and California. A solid brick wall; owners, Luning Co.; architects, Coxhead & Coxhead; contractors, Richardson & Gale; signed, June 3; filed, June 5; cost $3,950.

Ellis near Mason. Marble work; owner, Y. M. C. A.; architect, A. Page Brown; contractors, Inyo Marble Co.; signed, May 9; filed, May 11; cost $1,623.

Ellis near Mason. Terra-cotta work; owner, Y. M. C. A.; architect, A. Page Brown; contractors, A. Steiger Sons; signed, May 6; filed, May 11; cost $11,702.

Fell near Masonic Ave. Four flats; owner, M. A. Moldenhaurer; contractor, A. H. Baily, Jr.; signed, May 17; filed, May 18; cost $5,450.

Fell near Devisadero. Two-story frame; owners, Wm. and Rachel Smith; contractor, Wm. Plank; signed, May 26; filed, June 1; cost $3,843.

Filbert near Mason. Three-story frame, except painting and plumbing; owner, John Haub; architects, John & Balczynski; contractors, Weber & Kohler; signed, June 2; filed, June 3; cost $3,600.

Filbert near Mason. Three-story frame; owner, Jacob Schimp; architects, John & Balcznski; contractors, Weber & Kohler; signed, June 2; filed, June 3; cost $3,600.

Fillmore. Two-story frame; owner, Mrs. C. Fruitger; architect, C. W. Kenitzer; contractor, C. F. Ruppel; signed, May 16; filed, May 16; cost $4,825.

Florida near Butte. Two-story frame; owner, Ellen E. Ryan; contractor, E. Wilberg; signed, May 12; filed, May 12; cost $1,950.

Fremont Nos. 239, 241 and 243. Repairing and additions; owner, Jas. Enright; architect, Oliver Everett; contractor, J. T. Carberry; signed, May 10; filed, May 20; cost $1,640.

Fulton near Octavia. Excavating, brick, plastering, carpenter, plumbing, painting, tinning, etc.; owner, D. Guisto; architect, H. D. Mitchell; contractors, Cuneo & Caraglia; signed, May 29; filed, June 1; cost $4,790.

Garden near Harrison. Carpenter, brick, grading, plumbing, painting, plastering, mill, hardware, etc.; owner, C. H. Ingwerson; architect, M. J. Welsh; contractor, Henderlong Bros.; signed, May 31; filed, June 1; cost $4,025.

Green and Buchanan. Plumbing on six houses; owner, E. A. Sanders; contractors, Cowap & Trumbull; signed, May 2; filed, May 12; cost $1,095.

Hayes near Steiner. To build; owner, Bridget Mogles; contractor, John N. McLeod; signed, May 11; filed, May 11; cost $4,510.

Harrison bet. 5th and 6th. To build, except painting; owner, Henry Besthorn; contractor, Henry Munster; signed, June 1; filed, June 6; cost $4,675.

Harrison near 20th. Two-story frame; owner, J. J. Green; architect, A. J. Barnett; contractor, A. J. Ahern; signed, May 9; filed, May 9; cost $2,700.

Hoffman near Alvarado. To build cottage; owner, Mary A. McComb; contractors, Rule Bros.; signed, May 17; filed, June 1; cost $2,000.

Howard near 6th. Excavating, brick, carpenter, etc.; owner, Jos. F. Swift; architects, Martens & Coffey; contractor, John J. O'Brien; signed, May 13; filed, May 15; cost $5,500.

Howard near 11th. Alterations to a two-story frame; owner, Jos. Herrscher; architect, C. Mau; contractor, W. J. Field; signed, May 6; filed, May 11; cost $3,050.

Jones and Chestnut. Grading; owners, John and Clara Finley; contractor, J. J. Rauer; signed, Oct. 19, 1892; filed, June 3, 1893.

Kearny near Union. Two-story frame; owner, G. Filipelli; contractor, G. Ratto; signed, May 23; filed, May 24; cost $3,590.

Leavenworth near Lombard. Two-story frame; owner, J. J. Stofen; architect, Jas. H. Humphreys; contractor, N. R. Ellis; signed, May 24; filed, May 25; cost $2,488.

Lott near Hayes. To build except plumbing and painting; owner, Adolph Newmun; architects, John & Balczynski; contractor, F. V. Steinman; signed, June 8; filed, June 8; cost $3,650.

Market near City Hall Ave. Two-story brick; owner, S. H. Seymour; architects, Shea & Shea; contractor, W. W. Ackerson; signed, May 31; filed, June 2; cost $13,493.

Mason near Broadway. A frame building; owner, Mrs. Justi Capelli; architect, M. J. Lyon; contractor, Thos. Kinread; signed, May 6; filed, May 10; cost $8,100.

Mason near Eddy. Granite and sandstone work; owner, S. Silverberg; architects, Sailfield & Kohlberg; contractor, J. Sheedy; signed, May 11; filed, May 22; cost $1,250.

Mason near Eddy. Plumbing and gas-fitting; contractors, Samuel Ickelheimer & Bro.; signed, May 11; filed, May 22; cost $3,450.

Minna street, No. 1427. Alterations and additions; owner, Patrick Connell; contractor, M. S. Yerxa; signed, May 19; filed, May 20; cost $1,430.

Mission near Fair Ave. To build, except mantels, gas fixtures and painting; owner, Della Greenleaf; architect, E. A. Hermann; contractor, Henry Jacks; signed, June 3; filed, June 5; cost $4,650.

Oak near Clayton. Two-story frame; owner, Mrs. J. D. Jennings; contractor, W. W. Redmall; signed, May 11; filed, May 12; cost $3,742.

Octavia and Ellis. Grading, etc.; owner, Wm. Wolf; contractor, Jas. J. O'Conner; signed, May 18; filed, May 20; cost $4,709.

O'Farrell near Webster. Three-story frame; owner, David Bernstein; architect, A. J. Barnett; contractors, Miron & Gardner; signed, May 11; filed, May 18; cost $8,504.

O'Farrell and Grant Ave. Carpenter, marble and grille work, plastering, etc for saloon and basement; owners, Caley & Roeder; architect, Chas. I. Havens; contractor, C. B. Green; signed, May 26; filed, May 26; cost $1,855.

Page and Schrader. Plumbing, sewering, etc.; owner, John Witt; architect, F. P. Robin; contractor, H. Williamson; signed, May 18; filed, May 23; cost $1,074.

Page near Devisadero. To build; owner, Henry Mangels; architect, H. Geilfuss; contractor, F. Klatt; signed, May 9; filed, May 9; cost $4,800.

Page near Steiner. Two-story frame; owner, D. Sullivan; architect, P. R. Schmidt; contractor, J. J. O'Brien; signed, May 9; filed, May 10; cost $5,800.

Pleasant near Taylor. Three-story frame; owner, Annie Schurch; architect, Wm. H. Armitage; contractors, Gardner & Boyden; signed, May 20; filed, May 24; cost $6,500.

Polk street, No. 1710-1712. Alterations and additions; owner, Jos. Podesta; architect, Oliver Everett; contractor, John Strand; signed, June 1; filed, June 2; cost $950.

Post near Grant Ave. To alter elevator; owners, H. Liebes & Co.; architects, John & Balczynski; contractors, Cahill & Hall; signed, May 8; filed, May 15; cost $3,525.

Railroad Homestead Association, lot 4 block B. To build; owners, E. J. and Mary McMullin; contractor, Jos. Morris; signed, May 15; filed, May 20; cost $850.

Sacramento and Central Ave. Excavating, concrete and artifical stone work for a frame building; owner, John Irilary; architect, Wm. Mooser; contractor, H. M. Peterson; signed, May 22; filed, May 22; cost $1,950.

Seventeenth and Valencia. Lathing and plastering; owner, Mission Parlor Building Association; architects, Shea & Shea; contractor, J. T. Mackey; signed, May 8; filed, May 22; cost $1,215.

Shotwell near 19th. Painting; owner, Robt. R. Hind; architect, H. T. Bestor; contractor, Daniel Foley; signed, March 4; filed, May 11; cost $925.

Shotwell and 19th. Plumbing; owner, Robt. R. Hind; architect, H. T. Bestor; contractor, D. J. Daley; signed, May 2; filed, May 11; cost $2,050.

Spruce and Washington. Polishing and interior wood work; owner, O. D. Baldwin; architect, Samuel Newsom; contractor, P. N. Kuss; signed, April 19; filed, May 18; cost $1,200.

Spruce and Washington. Plastering and cement work; contractors, D. Leahy & Bro.; signed, April 14; filed, May 18; cost $1,040.

Stevenson near 20th. To build; owner, John T. Millbrick; architect, Edw. J. Vogel; contractor, Hugh Curran. signed, May 24; filed, May 25; cost $2,770.

Sunny Side. One-story frame; owner, John Johnson; contractors, Peterson & Olson; signed, June 3; filed, June 3; cost $1,420.

Sutter and Mason. Carpenter, tin roofing and galvanized iron work, etc. owner, S. Wenban; architects, Pissis & Moore; contractor, F. W. Kern signed, April 27; filed, May 18; cost $15,950.

Thirtieth near Noe. To build; owner, Mrs. B. Beck; contractor, O. E. White; signed, May 16; filed, May 19; cost $1,200.

Twenty-first and Howard. A frame dwelling and stable; owner, C. A. Clinton; architect, W. J. Mathews; contractors, Garden & Boyden; signed, May 20; filed, May 24; cost $8,575.

Twenty-third near Noe. To build; owner, Marietta I. Willats; contractor, J. A. McDonald; signed, May 13; filed, May 20; cost $2,300.

Turk and Larkin. Galvanized iron, metal and tin work; owners, Luning Co.; contractor, Forderer Cornice Works; signed, April 26; filed, May 15; cost $2,285.

Turk and Larkin. plaster work; owners, Luning Co.; architects, Coxhead & Coxhead; contractor, Chas. Dunlap; signed, May 3; filed, May 15; $3,000.

Turk and Larkin. Plumbing and sewering; owners, Luning & Co.; contractors, Duffey Bros.; signed, April 24; filed, May 15; cost $5,723.

Turk and Buchanan. Brick and carpenter work to four three-story frames owner, H. F. Fortman; architects, John & Balczynski; contractor, J. H. Munster; signed, May 10; filed, May 11; cost $23,678.

Turk and Buchanan. Plastering; owner, H. F. Fortman; architects, John & Balczynski; contractor, Arthur O'Brien; signed, May 10; filed, May 11; cost $3,070.

Turk and Buchanan. Plumbing; owner, H. F. Fortman; architects, John & Balczynski; contractor, Wm. F. Wilson; signed, May 10; filed, May 11; cost $3,900.

Union near Baker. To build; owner, Nicolas Silva; architect, J. B. Wuersch-contractors, The Home Building Co.; signed, May 10; filed, May 22; cost $2,900.

Vallejo near Laguna. Two-story frame; owner, C. A. Marshutz; architect, J. E. Krafft; contractor, S. H. Kent; signed, May 29; filed, Jnne 1; cost $8,970.

Vallejo near Laguna. Plumbing and gas-fitting; owner, C. A. Marshutz; contractors, Duffey Bros.; signed, May 29; filed, June 1; cost $1,200.

Vallejo near Polk. Carpenter, mill, etc.; owner, Earnst Lahgendorf; architects, Martens & Coffey; contractor, W. W. Ackerson; signed, May 9; filed, May 15; cost $3,600.

Vermont near Yolo. To build; owner, Morris Wendt; architect, R. H. White; contractor, D. T. Pierce; signed, May 9; filed, May 15; cost $4,933.

Vincent near Union. Two-story frame; owner, G. F. Ertola; contractor, Jean Ducasse; signed, May 24; filed, May 26; cost $1,500.

Washington near Jones. To build; owner, Matilda Wolff; architects, Pissis & Moore; contractors, F. W. Krelling & Sons; signed, May 9; filed, May 10; cost $12,800.

Washington bet. Lyon and Baker. A cottage; owner, Jas. Goveran; architect, Jos. P. Brady; contractor, John T. Hayes; signed, May 8; filed, May 10; cost $1,825.

ALAMEDA COUNTY.

Brush near Thirteenth, Oakland. Two-story frame; owner, Albert Rowe; architect, W. Kirk; contractor, L. H. Long; signed, May 11; filed, May 12; cost $7,245.

Caroline near Central Ave. To build; owner, F. Dohrman; contractors, Marcuse & Remmel; signed, May 8; filed, May 12; cost $2,700.

Caroline near Central Ave. To build; owner, J. C. Seigfried; contractors, Marcuse & Remmel; signed, April 20; filed, April 20; cost $3,950.

Fifth Assn. Tract, lot 9, block B, East Oakland. To build; owner, J. Williams; contractor, A. N. Frost; signed, April 17; filed, April 19; cost $1,280.

Folsom and Tenth, Golden Gate Tract. To build; owner, John Chicon; architect, E. Deplerre; contractor, T. A. Aymard; signed, April 24; filed, May 8; cost $1,350.

Grove near Sycamore, Oakland. To build; owner, Mrs. R. Farley; architect, E. C. McManus; contractor, H. W. Schacker; signed, May 9; filed, May 10; cost $1,500.

Haight Ave. Frame store; owner, F. C. L. Lawlor; contractor, A. R. Denke; signed, May 5; filed, May 8; cost $1,545.

Howard Ave. near Oakland Ave., Oakland. To build; owner, J. F. Callahan; contractor, C. S. Whalin; signed, May 9; filed, May 9; cost $1,300.

Moswood Tract, Oakland. To build; owners, C. H. and C. M. Dan Andker; contractor, K. Nelson; signed, May 10; filed, May 11; cost $1,500.

Ninth near Harrison, Oakland. Two-story frame; owner, C. Terney; contractor, D. S. Brehant; signed, April 15, filed, April 17; cost $6,650.

Pacific Ave. near Anglimbaugh. One-story cottage; owner, A. H. Wolf; contractor, A. R. Denke; signed, May 11; filed, May 11; cost $1,250.

Paru near Alameda Ave. Remodeling; owner, A. Schmidt; architect, C. S. Shaner; contractor, A. W. Cornelius; signed, May 11; filed, May 12; cost $2,185.

N. R. R. Ave near Walnut Ave. Three cottages; owner, Wm. J. A. M. Smith; contractors, Marcuse & Remmel; signed, May 6; May 8; cost $5,600.

San Pablo Ave. near 23d, Oakland. Two-story building; owner, J. M. Driscoll; architect, H. Burns; contractor, P. T. Nelson; signed, April 19; filed, April 31; cost $4,762.

Tenth Ave. near Twentieth, Oakland. Two-story; building; owner, W. H. Gregory; contractor, A. Burk; signed, April 3; filed, May 10; cost $3,672.

Twelfth Ave. near 15th, Oakland. Seventeen-room cottage; owner, M. E. Bacon: signed, April 11; filed, April 17; cost $3,200.

Washington near 11th. Oakland. Carpenter work; owner, F. W. Schultz; architect, C. Mau; contractors, Herbert & McLeod; signed, April 26; filed, April 28; cost $11,637.

PLACERVILLE.

Masonic Temple and Building. To build; owner, Masonic Hall Assn. architect, W. J. Cuthbertson; contractor, Beach & Co.; cost $17,000.

THIS journal is prepared to take charge of rendering perspective drawings in pen and ink or color. Charges will depend on size and kind of drawing wanted.

Upon receipt of plan and elevations, with a description of what is wanted, we will submit our estimates for the performance of the work.

THE project for the California Mid-Winter Exposition has taken definite shape, and if the enthusiasm of its originators can be imparted to the community of the State, the scheme bids fair to be a success. The time is short, however, and the work to be done immense, and if all difficulties are successfully overcome, great credit will be due the promoters of the enterprise, and undoubtedly much permanent good will result to this State and city.

IN another part of our paper will be found a detailed account of the excuse of an accident at the old Ford's Theatre at Washington by which so many lives were lost.

The lesson which has been so dearly taught ought to have presented itself to the common sense of the United States without such an experience. Professional men are well aware of the necessity of employing only well educated and experienced men on any construction—but the public are not so, so it seems necessary that some such event (it is a misnomer to call it an accident) as that before us should take place to call the attention of the public to these facts.

A competent architect or engineer should always be placed to superintend all works, no matter how apparently trivial they may be, that are undertaken by the government.

This occurence emphasizes the absolute necessity of having a body of men as architects who are thoroughly equipped in their profession—men who are compelled to pass an examination as are doctors and lawyers before they are admitted to practice. The Architectural profession involves more serious risks to life, health, happiness and general welfare, much more fold, than either of the other mentioned professions; and yet it is left to be recruited in a haphazard fashion from anyone who has the presumption to suppose he is fitted for it and is allowed to experiment on the health and life of the community.

ABUSES IN ELECTRIC WIRING.

BY GEO. P. LOW.

WHERE recently appeared in these columns an article upon the wiring of buildings for incandescent lights, in which was pointed out the utter helplessness of the layman in securing the conformity by wiring concerns in specifications for electric work and particularly was it indicated that the placing of an installation at three per cent drop in potential instead of at the two per cent loss so generally specified, will frequently net the electrical contractor hundreds of dollars saved in copper yet generally neither owner or architect will be able to detect the fraud. So completely has the universal ignorance in reference to the technical details of electric work placed the public at the mercy of a trade that is all but demoralized by irresponsible competition that property owners have in this "drop in potential" matter alone, paid thousands and thousands of dollars to wiremen for material contracted for yet which was never furnished. Nor in many instances, did the electrician intend to furnish this material when he contracted to do so. To the shame of the trade—for the just suffer with the unjust—it is a fact that of the truth of these statements there is not the slightest doubt.

Another fraud, equally flagrant with that described and which is closely akin to it, yet which, owing to the ease of detection, is not practiced so freely as it has been, consists in the substitution of a cheap and inferior grade wire for the high grade insulation that must always be used in concealed work. In localities not under the constant vigilance of an underwriters' inspector and where consequently, electrical matters all but take care of themselves, it becomes the simplest thing in the world to wire all circuits located in concealed and inaccessible places with an inferior wire and to splice on to the ends an approved insulation at all points where the wire is exposed to sight. Every experienced electrician—if he will—can cite instances in which this *felony* has been practiced. The word *felony* is used advisedly. If an electrician deceives an architect and defrauds an owner into paying for goods he did not deliver and never intended to deliver, it is a crime, but if he wilfully carrys the fraud to the extent that the property is endangered, that it may be burned from the wretched work and lives may be lost thereby, then the act is of that enormity that it should be treated as a felony. No one knows better than the insurance inspector that buildings have been so wired and that should he relax his vigilance, others would be so wired again.

Property owners suffer further great loss from the fact that sufficient judgment is not exercised in determining the proper voltage for which a building should be wired. Here again as in "drop," it is impossible to lay down a general rule that can be followed even for roughly approximate results. It may be stated however that except in buildings containing isolated plants, the voltage is determined from the nature of the plant or central station that is to supply the current. Should it be desired, the building may be so wired that the wiring may be occupied by any commercial low potential system of lighting, or to go still further, any building may be so wired that its circuits can be occupied by any incandescent system, whether for series or multiple lighting, but the last named scheme would be unnecessary, ordinarily.

The usual systems for which a building may be wired are known as the 50-volt, 100-volt, 110-volt and the three-wire, or 220-volt systems. As to the hazard presented by these systems they are about equally safe, and as far as the public is concerned they may be considered as merely different methods of distributing electric energy for commercial purposes. In the end they each accomplish the same thing, that is, by means of each, about 50 watts of electric energy is delivered to each 16 candle power lamp. But 50 watts may be 50 volts and one ampere, or 100 volts and one-half an ampere or 200 volts and one-quarter of an ampere, for the energy of a current of electricity is expressed in watts, which are derived in the product of the volts and the amperes that constitute that current. All 16 candle power lamps require about 50 watts to burn them, but these 50 watts may be variously derived as above stated, hence the voltage for which a building should be wired depends upon the voltage of the source of supply and upon the lamps to be used. Since lamp makers now furnish lamps of all voltages, the second consideration is immaterial. Clearly then the lower the voltage the higher the ampereage and as ampereage—not voltage—is the factor of electric energy that requires cross-section in the wire along which it travels, it is equally clear that the lower the voltage used, the greater must be the size of the wire run.

The point of greatest importance in determining the proper voltage is to derive the system that will meet all contingents and yet cost the least, for as will be shown, a vast difference exists in the amount of copper wire used by the various systems—and copper costs nearly 20 cents a pound.

In the accompanying table appear the ratios existing between the amount of copper used to effect any installation. In each instance, under the various voltages given, the results will be the same, each lamp will get the same amount of energy, the length of circuit is equal and the drop in potential is the same, yet it is plain from the table that for 50-volt work the amount of copper required will be 4 times that used in 100-volt work, 4.58 times that used in 110 volt work and 12.98 times that used in the three-wire system. Inversely the copper required if the installation was wired on the three-wire system, would be .077 of that used if the wiring was for 50-volts, .310 if 100-volts, and .375 if 110-volts.

RATIOS.

VOLTAGE	50 VOLTS	100 VOLTS	110 VOLTS	220 VOLTS
50	1.	4	4.58	12.98
100	.250	1.	1.21	3.22
110	.218	.826	1.	2.66
220	.077	.310	.375	1.

It must be borne in mind that these figures are theoretical. They, however, hold strictly good in practice except in the smaller sizes of wires where the fire underwriters' requirements prohibit the use of wire smaller than number 14, B and S Gauge. The ratios which the smaller wires bear to the large ones vary very materially in each installation but it is entirely safe to say that the amount of wire uselessly placed can be measured only in tons. The writer has in mind one large western building in which nearly $18,000 was thrown away absolutely, by reason of ignorance in selecting the proper voltage. Again as local electrical situations develop practices are becoming more uniform, and while only a year or two ago, owners were justified in wiring for 50-volts, at the present time the necessity for so doing is fast disappearing, particularly in large cities. Despite this many small and comparatively inexperienced electric wiring concerns still maintain that the only safe course is to wire for 50-volts. Frequently it is true, but by far more frequently is it true that precisely the same results would be attained with the expenditure of from one-fourth to one-thirteenth of the weight of copper necessary to install 50-volt wiring.

To the Editor of the California Architect:

FROM the most remote period of antiquity the tower has been a distinguishing feature of architectural composition. The towers most conspicuous in history, have been located on elevated ground, either natural or artificial, presenting a wide and firm foundation. The tower may be taken as a typical illustration of the sentiments and feelings of mankind. Man has a sense of ambition and a desire to rise above his fellows, so also should the tower rise to a towering height above all surrounding objects. Burke says in his essay on the "Sublime and Beautiful" that "astonishment is that state of the soul in which all its motions are suspended with some degree of horror." This sentence describes our feelings upon seeing an illustration in a morning paper of the proposed design for the buildings and grounds intended for the Mid-Winter Fair, bearing the name of Leon Bonet. It seems to me that no architect would make such a burlesque as that shown.

Upon an examination of the proposed design it appears that the central portion of the space is to be excavated and leveled off, and the outer portions of the plot to be raised, and the buildings erected thereon. As appears by the published design, the buildings will be about fifty feet in height and the terrace will descend about one hundred feet to the level of the central portion. A tower is shown standing in this lower portion; by itself, and if erected upon elevated ground, this tower would make a creditable appearance, but when placed as shown in the design is suggestive of many things. The lowest section might be used as a crematorium, or else for the reception of a power house and electric plant, and the column above as a light beacon, but for the fact that it is too low, and the light would be confined to the inclosure. It might be intended as a monument, but the effect would be insignificant, if a person had to climb a hundred feet to get a full view of it; monuments are not generally inspiring when looked down upon; possibly some of our former enterprising citizens may take that view of the subject. If it was intended for use as a smokestack the situation is also unfortunate, as the wind sweeping over the surrounding buildings would be apt to cause a down draft. Many other possible purposes might be mentioned if space permitted.

In all seriousness is this design to be typical of the whole scheme?

Yours truly,

CRITIC.

FIFTH ANNUAL COMPETITION FOR THE ROBERT CLARKE TESTIMONIAL.

UNDER THE AUSPICES OF THE CHICAGO ARCHITECTURAL SKETCH CLUB OF CHICAGO.

CONDITIONS—The author of each design must execute all drawings without assistance, and non-adherence to these conditions will cause the rejection of the design or designs in question.

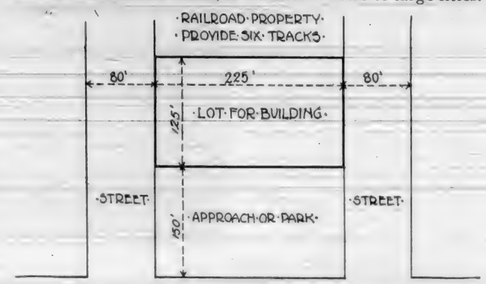
The competition is open to architectural draughtsmen under thirty years of age, residents of the United States and not practicing architects.

The awards will be made by the Adjudicating Committee on the "Robert Clarke Testimonial" competition, and are:

FIRST PRIZE	GOLD MEDAL.
SECOND PRIZE	SILVER MEDAL.
THIRD PRIZE	BRONZE MEDAL.

The prize drawings are to become the property of the Chicago Architectural Sketch Club.

PROGRAMME—A design for an elevated railroad terminal station for suburban traffic, in business centers of large cities.



PLAN OF SITE.

The building is to have three general stories, the first or ground floor to contain a lobby, stairways, offices and all necessary conveniences.

The second floor is to be on a level with the platform and to contain one general waiting room, one waiting room for women and one for men, toilet rooms, ticket office, depot master's office and necessary stairway to reach the Railroad Co's offices on the third floor.

The building can be smaller than the lot outlined on the accompanying diagram, and the space in front is to be used as an approach or park.

The drawings are to consist of the following, their arrangement and the number of sheets being left to the discretion of the competitor:

First or ground floor plan, second floor plan, front and side elevations, transverse or longitudinal section, perspective and block plan. Size of sheets to be 22x28 inches.

Plans, elevations and section to be drawn to a scale of 1-16 of an inch to a foot, pen and India ink rendering. The perspective to be drawn from an 1-8 scale plan, rendering optional.

The drawings are to be marked with a motto or *nom de plume*, and accompanied by a sealed envelope marked in the same manner, containing the name and full address of the author, with the place and date of birth, and must be delivered flat to HUGH M. G. GARDEN, Secretary, Chicago Architectural Sketch Club, at the Club Rooms, 913 Masonic Temple Building, Chicago, on or before Monday, October 2, 1893. Charges to be prepaid. All drawings other than those receiving prizes will be returned at the expense of the contributor.

The Adjudicating Committee on the Robert Clark Testimonial:
W. L. B. Jenny, Chairman.
Samuel A. Treat.
Chas. A. Coolidge.
D. H. Burnham.
Lorado Taft.

CALIFORNIA SLATE.

VERY few people, unless it be the architects, are aware that located in our "fair State" is one of the largest deposits of slate in the world. Its quality is second to none being a beautiful dark steel blue in color, tough and easily worked; it improves by exposure, and will not change color. In fact a true slate in every sense.

A better idea may be obtained of the magnitude of this slate deposit when one considers that the ledge is over 2000 feet wide, 1600 feet high from the bed of the American River—very likely as deep below the bed, with a length of two miles. A great mass, indeed, of fine material, good for all purposes where slate can be used.

PLATE NO. 1.

This deposit is situated in El Dorado County, about two miles from the city of Placerville, on the American River, at the bridge on the road leading to Georgetown. This deposit has been opened and worked in a small way for the past six years. Recently a company was incorporated who purchased the deposit, and has erected an improved plant of machinery for quarrying and manufacturing the material into roofing slate, slabs, etc. It is now in full operation, turning out several thousand squares of roofing slate each month, besides slabs and tiling in large quantities.

PLATE NO. 2.

The accompanying plate No. 1 shows the largest of the quarries, there being two in operation. The machine shown is known as a Channeler, which cuts the slate into solid blocks 6x8 feet. This machine is run by compressed air forced up from the machinery or compressor rooms in pipes, a distance of 500 feet to the quarry. From the Channeling machine the blocks are conducted on a tramway to where they are split into slabs. These slabs are then placed under the saw, which is made of wire 1400 feet in length, running over numerous sheaves and passes over the slate slabs to be cut, the wire being held down by an automatic appliance on the slate. During the passage of the saw, sand and water are dropped on the part to be cut. Thus the slabs are cut to any desired size. From the saw the slate is conducted on an inclined railway to the splitting sheds, is there split and trimmed ready for shipment. Slabs for billiard tables, tiles, and other purposes are cut to size in the same way, by the wire saw and sand. The sand used in cutting, is what is known as "Quartz Sand," and is at hand in great quantities. From the fact of its not having travelled but a short distance, the cutting edges are fully perserved. It is remarkable to note how fast the wire will pass through the slabs of slate.

The parties who first opened these quarries worked them by the old process of blasting with powder, and handling it by the system carried on in Wales for the past hundred years, destroying thousands of tons of the finest material through the action of powder. But by means of the machinery erected by the new company, almost all of the slate taken from the quarry is saved, and turned into a ready market.

The accompanying illustrations give one only a partial idea of these quarries. Plate No. 2 shows the quarry as it appeared when worked under the old system. Men may be seen in the act of drilling holes by hand in the slate to take the blast. Plate No. 3 shows the vast dumps of waste slate. These dumps are made up of the finest material broken into pieces, and almost worthless by blasting. But with such a mountain of slate the former owners of the quarries gave no thought to the material wasted. After a blast they selected the largest blocks or slabs, and the rest was consigned to the dump. Plate No. 4 shows the Channeling machine and one of the benches started by the new owners. This is in the largest quarry, which is an opening in the face of the hill, 250 feet in heighth, and over 400 feet in width. By the use of the machine, the quarry will present a series of steps or benches from bottom to top, six feet each in heighth.

PLATE NO. 3.

It would be hard to estimate the value of this immense deposit. In Wales and the eastern states thousands of men are employed in the slate industry, some of the quarries in Wales employing from three to four thousand men each. Let us hope that ere long we may see as many employed in the slate quarries of El Dorado county.

Surveys and estimates have been made for an overhead rope-way to be erected by the new owners, to transport the slate to the railroad at Placerville, a distance of about two miles.

THE MINISTER—"Do you ever think of a higher life, Miss Emma?"

MISS EMMA—"No! papa is so much afraid of fire we always take the first flat."—*New York Herald.*

THE WESTINGHOUSE ELECTRIC COMPANY'S PROPOSED WORKS AT BRINTON, PA.

THE plans for the Westinghouse Electric Company's new plant at Brinton are nearly ready, says the *Electrical Review*. Of the 222 acres owned by the company, 23 will be covered by the works. The machine shop will cover a space of 750 feet by 250 feet; the warehouse 750 feet by 25 feet; the foundry 700 feet by 250 feet; and the boiler house 150 feet by 40 feet. Including other buildings, the area of the ground floors will be 7⅜ acres, and including the second floors, 15 acres. The structure will be fire-proof stone and steel on the latest methods, and labor-saving devices will be employed to the fullest extent. Electricity as a motive power for labor-saving machinery will be utilized. It is estimated that the saving from the consolidation of the plants will not be less than $250,000 a year. Two hundred houses for the employees will be built at once.

MR. EDISON'S FUTURE WORK.

WHAT tireless inventor, Mr. Thomas A. Edison, has been again heard from as regards the problems he has undertaken to solve. He has not, by any means, given up his idea of devising ways and means of obtaining the energy of coal in a manner more direct than the present wasteful methods, and he promises to soon resume experiments along this line. He has had enough of the machinations of Wall street, however, and what he does hereafter, will be through his own enterprise entirely. He proposes to control all his future inventions himself, without the aid of Wall street.—*Electrical Age.*

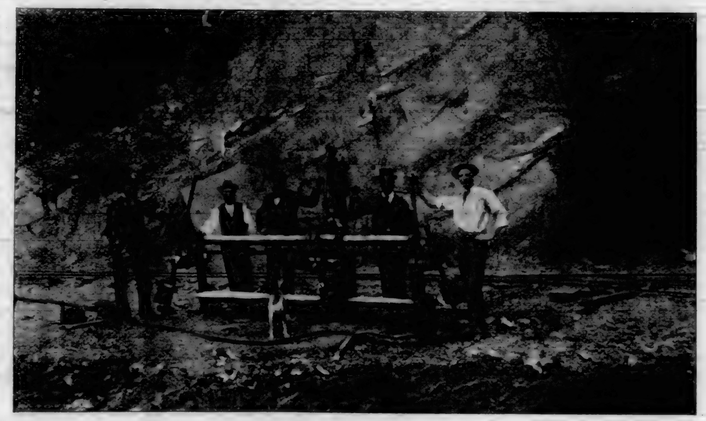


PLATE NO. 4.

ILLUSTRATIONS

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

THE Tower for the New City Hall, is by architect Frank T. Shea.

THE Kern County Land Co's Building at Bakersfield is by Henry A. Schulze, architect.

A residence for Mr. Wm. T. Garrett in Alameda, is by architect Fuller Claflin.

ACCIDENT IN THE BUILDING OF RECORD AND PENSION DIVISION, WAR DEPARTMENT, OLD FORD'S THEATRE, WASHINGTON.

LACK OF INTELLIGENT SUPERVISION OF UNDERPINNING.

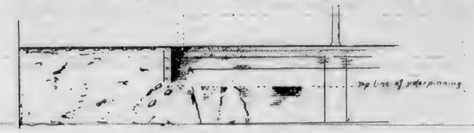
FORD'S old theatre situated on Tenth street between E and F streets was erected by John T. Ford in 1857. Mr. James Gifford was the architect. After Lincoln's assassination the Government took possession of the building and arranged the interior for the Army Medical Museum. The back wall was, and is, considerably out of plumb. The interior, with probably the exception of the roof, was replaced, the floor being supported on cast-iron columns carrying iron beams with four-inch brick arches sprung between them. The back wall, which was out of plumb was strengthened by the addition of an interior wall and anchors tying the wall to the system of interior beams.

The first floor rests on a series of arches sprung from dwarf walls two feet eight inches high from footing to spring line. These arches began about twenty feet from the front wall; the floor on the intervening space rests on sleepers laid in an indifferent bed of concrete.

A small cellar was arranged in the back of the building in which the heating apparatus was located.

For several weeks workmen have been excavating a passageway from the front to the rear of the building. The central archway had been selected for this purpose. The dirt for this passage was removed, and the dwarf walls were underpinned for a height of about four feet. Curious as it may seem, they had practically completed the underpinning, having finished all the piers on which the columns rested except one, this one as an excavation was made beneath it, gave way, letting down the colum marked *A*, pulling over the column marked *B* and precipitating the beams and brick arches which rested upon them on both the second and third floor to the first floor. The portion of the first floor which rested on 3″ x 4″ sleepers was carried into the excavation. The brick arch over the passageway did not fall. The roof, fortunately, was independent of the system of columns, reaching from wall to wall.

The clerks working on the different floors fell with the falling iron, brick, timber and desks, as there was no warning. Nineteen were killed by the fall, one who was safe, was killed by jumping from a window and sixty-eight were



injured, three having died from their injuries. Twenty workmen were under the archway. The bricklayer, who was preparing to underpin the pier which gave way, feeling dirt fall on his neck, stepped back (out of harm's way) to brush it from his neck just as the crash came.

This accident has brought to light customs of the War Department, which if practised by an individual or a corporation would not only be considered criminal but would render them liable to prosecution and conviction for manslaughter. It seems that in work of this character, where the lives of many people are at stake, it does not employ proper expert supervision, and further, that it does not even get expert advice as to the proper methods of conducting such an important undertaking as underpinning a series of piers on which rested columns supporting two stories of brick and iron floors, 13x20 square feet, loaded with men, desks and papers. The methods adopted in carrying on this work show an entire lack of comprehension of the matter in

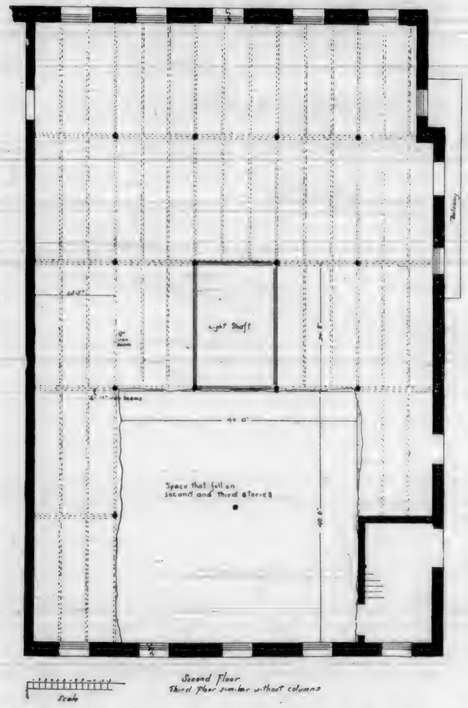
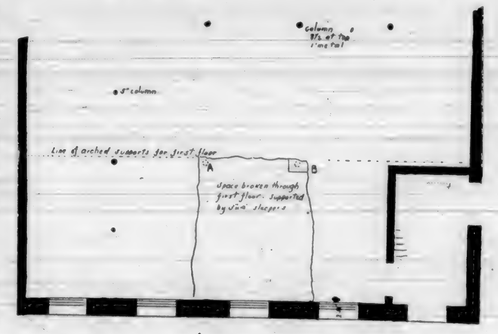
hand. Each pier had, at a low estimate, 51,000 pounds resting on it when the earth was taken from beneath, leaving a bond of about three feet of brickwork to support this great weight above. Curiously, this method was successful until they came to the last column. This pier had a wall bonding into it only on one side, hence they were depending on the strength of a brick corbel with only the counterbalancing weight of three feet in height to support 51,000 pounds. They (we might say miraculously) accomplished this feat at *B*, but at *A*, the last pier, what might have been considered inevitable, happened. The brick corbelling and the little support which was obtained from the earth, a mixture of sandy clay, gave way and the columns and superstructure which they supported collapsed. It does not seem to have occurred to the contractor or any of his supervisors to have shored up the story above. The ease and slight cost of such shoring the cross-beams by temporary support one would think would have commended itself to the most obtuse as well as the most penurious person, whether it was a Department Chief or a contractor. It appears from the assertions of those who made estimates on the job, that no specifications,* drawings, or directions were given for the work. The party in charge of the building said that no specifications were needed, all they wanted was that the dirt should be dug from beneath the walls, and the space bricked-up. That was the quality of expert direction as to how the work should be done. The supervision consisted in Colonel Ainsworth (medical Colonel), Chief of Division, the man who attends the boiler (dubbed engineer) and the contractor for the brickwork examining the work daily and asserting that everything was all right. Dr. Ainsworth and Captain Thorpe, who let-out the contract, assert that this is a common way of letting-out contracts for the War Department, and the Supply Division or Quartermaster's Department which has charge, of course, know little if anything about how the work should be done, hence they depend on the contractors.



This is a sorry confession from the Department which has the whole Engineer Corps of the United States Army at its command. To what better use could the engineers be put in times of peace than computing the weights and size of shores to resist them, and specifying the necessary precautions that shonld be taken in such cases as this? It seems as though such trifling affairs are not worthy the attention of even a lieutenant in the Engineer Corps.



It is a serious question to decide which party is the most to blame, the contractor, Dant, who should at least have known a little about relieving the piers from the weight above underpinning them, or the army officer, Dr. Ainsworth, who should have obtained expert advice and supervision.

The coroner's inquest and the Board of Inquiry, consisting of General Casey, General Batchelder and Major N. Davis, will investigate and probably place the responsibility where it properly belongs. Several questions have arisen in reference to this accident. The building has been condemned by reports of the Surgeon-General Barns, in 1881, and Representative Shellaberger, in 1883. These reports have naturally been talked over and magnified by the clerks. They seem to bear principally upon the bad light, lack of ventilation and the first floor having no cellar, so it was not considered healthful; and further, that the roof was not fireproof and the valuable collections of the Medical Museum were, therefore, in an unsafe building. The walls seem to be strong. The floor beams are lighter than would be used in ordinary practice, being 9" for a span of a little over twenty feet. Beams about four feet four inches on centres. This would be safe, but would give more deflection than would be considered agreeable. The collapse evidently did not occur from the condition of the building, as many suppose. The daily papers and the clerks make quite a point of the floor (which was temporarily supported by the sleepers and roped off while the excavation was going on) shaking when walked upon, but of course this had no bearing upon the accident. It was simply carelessness in preparation for doing and supervising the excavating and underpinning of the new work that was the immediate cause of the failure.

The accident also brings forward prominently the notoriously unhealthful and reported unsafe condition of the Government Printing-office as well as other make-shift buildings which the Government occupies in this city, and again calls attention to the fact that many such buildings are overloaded, and an entire lack of knowledge as to what the floors were intended to carry. All such buildings should have their capacity computed and posted on every floor, as the documents and other matter which the Government stores away, increasing daily, are a menace to the stability of the buildings and the life of their occupants.—*The American Architect and Building News.*

*"The contractor making the above statement declined to bid, and hence, presumably, the crude specification and drawings (which I have seen since writing the letter) which are stated to have been prepared, "not by a regular architect or *builder*," . . . but by a "steam engineer"; *i. e.*, the man who attended to the boiler for the heating-apparatus. The estimates and contract were made on such an indifferent basis as this.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.
GEO. H. SANDERS, Pres. W. J. CUTHBERTSON, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
C. E. GRUNSKY, Pres. CHARLES D. MARX, Vice-Pres.
OTTO VON GELDERN, Sec. GEO. F. SCHILD, Treas.

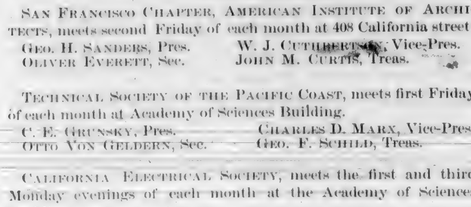
CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

A special meeting of the members of the San Francisco Chapter A. I. A. was held July 7th in reference to the buildings for the proposed Mid-Winter Exposition viewed from an architectural standpoint.

It was the general opinion that the best results could be obtained by following the method so successful in producing suitable designs for good execution at the World's Fair at Chicago, viz: by appointing a supervising architect for the entire work, and an individual architect for each building—a committee was appointed to present to the Executive Committee of the Mid-Winter Exposition resolutions embodying these suggestions.

The regular monthly meeting of the Chapter, held on the evening of the 14th, approved the action taken by the members at the special meeting. A committee consisting of Messrs. Bestor, Curtis and Kollofrath was appointed to consider the advisability of holding an architectural exhibit in connection with the Mid-Winter Fair and report at next meeting.

An amendment to the By-Laws was proposed to be voted on at next meeting.



We have received from the author James R. Willett, Esq., a copy of his address on HEATING AND VENTILATION OF RESIDENCES, delivered to the Engineering Society of the University of Illinois, March 23, 1893, confining himself to its practical application in order to show the way in which a person engaged in such business may prepare designs for excavation. It cannot fail of being useful to the class for whom intended, as well as of interest to the general reader.

The first number of a monthly journal called "ORNAMENTAL IRON, devoted to industrial art, has just been received, certainly the publishers have reason to congratulate themselves upon having produced a jem. The illustrations are truly works of art applied to every day use.

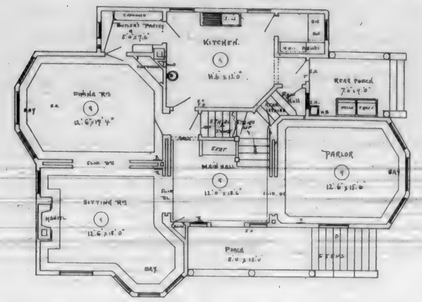
Published by The Winslow Bros. Co., office 761 Rooking, Chicago, Ill. Subscription price per year $2.00.

The circular of the SCHOOL OF ARCHITECTURE of the University of Pennsylvania, just received, is a very attractive four-page leaflet, in two colors, describing in brief and comprehensive form the advantages offered by that institution, its faculty, course of instruction and equipment. Full information will be sent upon application to the Dean of the College Department.

RESIDENCE IN SAUSALITO, W. H. LILLIE, ARCHITECT.

The June number of PAINTING AND DECORATING contains a paper on glass embossing, by Arthur Segmour Jennings. The regular departments contain much to interest the carriage painter, paper hanger and all branches of the trade. One dollar a year seems a small price to pay for so excellent a magazine. Published by the House Painting and Decorating Publishing Co., Philadelphia.

We are indebted to THE WINSLOW BROS. CO. of Chicago, for a handsome collection of photographs of ornamental iron. This new photogravure edition of their catalogue for the year 1893 is certainly a very creditable specimen of the printers art, but cannot fail of being of great use to the architect and contractor who are about to order work of this kind. A long list of buildings that have been supplied with this class of work by this firm, being in many cases illustrated by engravings, gives the reader an opportunity to judge of the effect produced, which in some instances is really very fine. Mr. P. H. Jackson & Co., of 228 and 230 First street, this city, are the agents.



LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

CONSTRUCTION OF LAWS IN REGARD TO MECHANICS' LIENS.—Under the provision of the Laws of Ky. that persons furnishing labor or materials for the construction of railroads and other public improvements, by contract express or implied, with the owners thereof, or by a subcontract thereunder, shall have a lien thereon for the price of such labor and materials, does not embrace one who furnishes such labor and materials under a contract with a sub-contractor.

Cent. Trust Co. v. R. N. I. & B. R. Co. Circuit Court D. Ky. 54 Fed. Rep. 723. 74.

NEGLIGENCE OF INDEPENDENT CONTRACTORS.—Where a contractor agreed to furnish all materials for the construction of piers, for a railroad bridge across a river, the materials to be subject to the inspection and approval of the engineer of the railroad, and to construct the piers according to certain plans and specifications under the continuing inspection and subject to the approval of the engineer, he was an independent contractor and as such liable for the injuries to third persons, resulting from his negligence in the performance of the work.

Casment v. Brown, 13 Supreme Court Reporter 672. 86.

EFFECT UPON MECHANICS' LIEN OF FAILURE TO RECORD CONTRACT.—Where the constitution provides that mechanics, material men, etc., shall have a lien on the property on which they have labored or furnished material, and the statutes provide that all contracts between the owner and contractor for work, where the amount exceeds $1,000, shall be in writing and recorded before the work is begun, otherwise the contract to be void, and no recovery to be had thereon by either party thereto; that the labor done and materials furnished by all persons except the contractor shall be deemed to have been done at the instance of the owner, and they shall have a lien for the value thereof, a contractor who has failed to record his contract for work, where the amount to be paid therefor is over $1,000, is not entitled to a lien.

Morris v. Wilson, Supreme Court of Cal. 32 Pac. Rep. 801. 131.

ASSIGNMENT OF RIGHT TO MECHANICS' LIEN.—Where the statute provides that all persons and laborers of every class, performing labor upon, or furnishing materials to be used in the construction of a building, may have a lien thereon for such services or materials; and also provides that such persons shall themselves file a claim for record, stating the character of the labor or materials which they themselves furnished for the building, the right to assert such a lien is a personal right, for the laborer's own protection, and cannot be assigned.

Mills vs. LaVerne Land Co., Supreme Court of Cal. Feb. 1, 1893, 32 Pac. Rep. 169. 90.

WHERE BUILDING IS NEGLIGENTLY CONSTRUCTED.—In an action on a contract for the erection of a house, the owner pleaded a set-off for failure to build the same in a workmanlike manner, his evidence showed that the floors were not level, that the windows were not vertical, not at equal heights from the floor, though intended to be on the same level; that they had embrasures above them; that bricks were put in the outer wall that had to be removed; and that one room had so many holes in the wall that daylight could be seen at seventeen different places. The contractor's evidence was that the house was constructed according to the local custom, but did not greatly qualify the facts shown by the owner. If a man contracts to build a house in a workmanlike manner, that means a house built in a workmanlike manner, constructed according to the customs and usages of the section of the country in which the countract is made, but a custom which justified the erection of a house in the manner shown by this owner, is unreasonable.

Anderson v. Whittaker, Supreme Court of Alabama, 11 So. Rep. 919. 185.

SEMI-ANNUAL SUMMARY OF BUILDING OPERATIONS.

The first six months of this year has shown a slight increase in comparison with the first six months of 1892, both in the number of buildings and total cost.

CHICAGO ARCHITECTURE.

NO other American city can claim such a record, and it is not the least glory of the whole that the artistic results are as satisfactory as they are characteristic. Granted that the bad buildings of the city out-number the good, the latter are already so numerous and are so entirely part and parcel of Chicago as really to represent its present architectural spirit. And this spirit is thoroughly business-like, thoroughly comprehensive of the complicated problems which hedge in and bind the architect at every turn. Chicago buildings are not palaces, they are not highly ornamental edifices, they are not wonders of decorative skill nor miracles of gingerbread appendages. They are calm business structures, designed for business, used for business and admirable because the business motive is so evident. If they are plain it is because there is reason for the plainness, not because their architects cannot design good ornament nor because decorative structures are not appreciated. They must be judged for what they are, not what they are not nor what they might have been. Those who want palaces for their places of business should not find fault with the people of Chicago because they are wiser and reserve their palatial work for palatial structures or some public building like the Auditorium. The buildings of Chicago form one of the most distinctive and remarkable and successful products of American architecture, and it will be a decided step in advance when we in the East learn to appreciate them better and take them as models for similar structures for ourselves.

At last America has buildings worth going a thousand miles to see, and the traveler who sets forth from New York on his first Western tour will find in the buildings of Chicago some examples of a new form of architecture, a more sensible and more business-like treatment than he will find at home. The least impressive of the lessons he takes away with him will not be the one he gains from the study of Chicago's new buildings.—*Lippincott's.*

Rub a creaking hinge with a very soft lead pencil.

BUSINESS MOSAICS.

The present utilitarian age is one of continuous advancement in the perfection of improved methods of construction, and the scientific specialist is always on the *qui vive* to discover more economical processes for applying the materials placed at his disposal by arts and sciences of advancing civilization. Numerous examples of the application of these remarks can be found, and to call attention to a notable instance of securing greater strength by the combination of two materials, is the object of this writing.

As the gothic architects of the middle ages studied the thrusts of arches till they had ascertained the least weight required to establish an equilibrium of force and the best possible way of disposing of that weight, and out of the results of their studies reared those wonderful cathedrals that now remain as enduring monuments of the skill and knowledge of their designers, so with a similar purpose, the constructors of the present generation are studying to arrive at the simplest and most economical processes for disposing of the more numerous and varied materials at their command, and on pages v, vi and vii of this issue of the CALIFORNIA ARCHITECT, is a detailed description of the methods now perfected and employed by Mr. P. H. Jackson, for combining the great compressive strength of concrete, with the great tensile strength of iron, thus neutralizing the comparatively weak tensile strength of the concrete, and enabling the construction of sidewalk arches, roofs of vaults and fire-proof floors, etc., without the use of the customary steel supporting beams and girders, thus effecting a very material saving in the amount of money required, and resulting in material savings to the property owner, that are more eloquent and speak in louder tones than the language of the most gifted orator.

This saving in cost, which has been secured without lessening the strength of his constructions, enables Mr. Jackson to increase his already extensive business in the face of all competition, and the experience gained during his long connection with the department of public works in New York city, showed him how to practically apply the successful solution of problems and achieve the remarkable results that have sprung from his studies.

In this connection the reader should carefully peruse the scientific analysis of the principles that underlie this construction, which were fully discussed in a paper by Calvin Brown, C. E., published in the June number of this journal.

Mr. Brown enjoys a deservedly high reputation in the scientific world, and the ability and skill displayed in designing and building the immense dry docks of the United States Government at Mare Island, made him one of the best of recognized authorities. In whatever concerns the use of concrete and cement, his opinion can be relied on absolutely, and no more interesting reading can be had by architects and builders than lucid explanations of the principles that have been so successfully applied by Mr. Jackson.

We predict that the use of this method of employing concrete and iron will enter more largely into the construction of the future, not only for the heavier and more substantial buildings suitable for mercantile purposes, but with the object of making the residences of the future more substantial, more enduring and more in keeping with the progressive spirit of the age. It rests with the progressive architect when designing the structures to be erected under his supervision, to take advantage of the opportunities thus presented and introduce into his specifications the result of Mr. Jackson's latest thought.

Verdant Visitor—"What's all the fuss about? Accident happened? BROKER—"The cordage trust has gone to pieces, shares have fallen from 75 to 16. VERDANT VISITOR—"I am not surprised at all. No wonder there is no demand for cordage when the electric chair has been substituted for the rope."

Antinomin is said to offer a complete protection against Dry Rot, Fungi, Mildew, etc., it can be applied like white wash with a brush; is odorless and non-volatile, it has the recommendation of many architects in the old countries. If half that is claimed for this wonderful chemical with a still more wonderful name o-dinitrokresolkalium is true, it is well worthy the attention of architects and engineers. For further information apply to W. H. Schieffelin & Co., New York city.

"The servant you have now seems very nice and quiet."

"Oh, yes: she doesn't even disturb the dust when cleaning up a room."—*Chicago Tribune.*

Model Art Glass Works.—Notwithstanding a conflagration on the second of May last, nearly destroying Mr. Wm. Schroeder's works at 29½ Fremont street, thanks to the energy of the latter gentleman, they were soon rebuilt. A company was then incorporated of which the following are the directors:—Wm. Schroeder, President; Edward Lemme, Vice-President; Henry J. Breuer, Secretary; Wm. Buttner, Superintendent; Wm. J. Breuer, Director.

Mr. Wm. Schroeder continues the management of the works. When such an establishment is at hand no excuse can be given to send for such work abroad.

San Francisco Slate Co., whose office is in the Mills building, have furnished us the illustrated account of the quarries of their company, which appears in this number of our paper. It will be found of much interest; and as for the quality of the slate, parties interested have only to call at the office where full particulars and information will be given. Take the elevator and go to 10th story, rooms 4 and 5.

The attention of our readers is called to an interesting illustrated article in this number of our journal under the title of California Slate Company of this city, having an office in Mills building, are introducing to notice an article of slate said to be equal in quality to any found in the market: it is taken from a quarry described as being 2000 feet wide and 1600 feet high from the bed of the American river and very likely as deep below the bed.

CITY BUILDING NEWS.

Belvedere bet. Waller and Frederick. Plumbing five houses; owners, Smith, Coop and Hinkle; architect, Ed. Burns; contractor, Geo. Humphreys; signed, June 27; filed, June 27; cost $1,375.

Broderick near California. Two story frame; owner, Paul Aguilar; architects, Percy & Hamilton; contractor, F. W. Kern; signed, June 14; filed, June 15; cost $3,490.

Bush near Powell. Painting; owner, Mrs. L. M. Bigelow; architect, J. C. Newsom; contractors, A. Gradin & Co.; signed, June 15; filed, June 17; cost $975.

Bush near Powell. Mill work; owner, Mrs. L. M. Bigelow; architect, J. C. Newsom; contractor, C. M. Depew; signed, June 14; filed, June 17; cost $3,500.

Bush near Powell. Plastering four 2-story frames; owner, W. A. Van Dervort, architect, J. C. Newsom; contractor, G. W. Glosser; signed, June 19; filed, June 26; cost $1,775.

Bush near Powell. Four 2-story frames; owner, Mrs. L. M. Bigelow; architect, J. C. Newsom; contractor, W. A. Van Dervort; signed, June 16; filed, June 10; cost $15,900.

Bush near Powell. Plumbing four 2-story frames; owner, Mrs. L. M. Bigelow; architect, J. C. Newsom; contractor, H. Williamson; signed, June 13; filed, June 13; cost $2,400.

Carl and Stanyan. Painting; owner, Thomas Lundy; architect, T. J. Welsh; contractor, M. J. Donovan; signed, May 28; filed, June 27; cost $1,286.

Carl and Stanyan. Two-story frame; owner, H. Johnson; architect, J. Wuersching; contractor, L. F. Fletcher; signed, July 5; filed, July 5; cost $1,800.

Central Ave. near Washington. School building; owner, Edward B. Spalding; architect, Wm. Curlett; contractor, Jos. Norris; signed, June 28; filed, July 1; cost $8,425.

Clarence Place and Townsend. To construct concrete tunnel; owners, Edison Light and Power Co.; architect, Chief Engineer employed by owner; contractor, W. J. Holmes; signed, June 3; filed, June 5; cost $19,500.

Commercial and Battery. Repairs to brick building; owner, Henry Kane; architect, M. J. Lyon; contractors, M. Fennell & Son; signed, May 31; filed, June 15; cost $1,500.

Eighth Ave. near Point Lobos. A cottage; owner, A. E. Lowry; contractor, Thos. Ridout; signed, June 6; filed, June 10; cost $1,750.

Ellis near Mason. Interior wood finish and mill work; owner, Y. M. C. A.; architect, A. Page Brown; contractors, Burnham, Standeford & Co.; signed, June 9; filed, June 10; cost $13,000.

Ellis and Webster. Alterations; owner, J. F. Ross; contractors, Cook & Patterson; signed, June 14; filed, June 14; cost $1,610.

Filbert near Jones. Three-story frame; owner, J. J. Howser; architects, John & Balezynski; contractor, Emil Hoelle; signed, June 21; filed, June 24; cost $3,750.

First near Natoma. A four-story brick; owner, Pacific Metal Works; contractors, Smille Bros.; cost $20,000.

Folsom and Treat Ave. To build; owners, R. W. Lahaney and wife; architect, D. J. Ellis; contractors, J. P. Rines & Son; signed, June 20; filed, June 26; cost $790.

Folsom street. A cottage; owner, Chas. Hankel; contractors, Koening Bros.; signed, June 15; filed, June 28; cost $1,600.

Fourteenth Ave. and L. Alterations; owner, Board of Education; architect, J. C. Havens; contractor, Robert Currie; signed, June 7; filed, June 10; cost $877.

Francisco near Powell. Excavating and brick work; owner, J. Schweitzer; architect, H. Geilfuss; contractor, J. O. Sullivan; signed, June 30; filed, July 3; cost $4,329.

Franklin and Hickory Ave. Three-story frame; Mrs. C. M. Berger; architect, Oliver Everett; contractor, Jos. McLean; signed, June 12; filed, June 13; cost $6,000.

Golden Gate Ave. near Lyon. One story frame; owner, A. F. Morton; architect, J. B. La Romer; contractor, Todd Boone; signed, June 19; filed, June 19; cost $2,395.

Green near Scott. Two-story frame; owner, Carrie L. Lawler; architect, Fuller Claflin; contractor, A. C. Soule; signed, June 23; filed, June 27; cost $8,500.

Harrison bet. 7th and 8th. Tinning and roofing; owner, Timothy Hopkins; contractor, Forderer Cornice Works; signed, June 12; filed, June 14; cost $9,978.

Hoffman near Alvarado. To build; owner, G. B. Lang; contractors, Soule Bros. signed, June 5; filed, June 12; cost $1,800.

Hyde and California. Carpenter, plastering and stair work; owner, Fred Kutz; architect, A. C. Lutgens; contractor, F. V. Steinmann; signed, July 1; filed, July 5; cost $12,000.

Jackson near Devisadero. Plumbing 3-story frame; owner, Chas. I. Wingerter, architect, A. C. Lutgens; contractor, W. F. Wilson; signed, June 14; filed, June 17; cost $1,084.

Lafayette near Minna. To build; owner, E. Lauthier; architects, Townsend & Wyneken; contractor, J. A. McDonald; signed, June 6; filed, June 12; cost $1,765.

Lily ry near Church. A 1-story frame; owner, E. J. Malloy; contractor, Daniel Einstein; signed, June 19; filed, June 20; cost $1,714.

Lyons near Page. Alterations; owner, Kate Johnson; contractor, F. V. Acker; signed, June 13; filed, June 13; cost $1,726.

Market near City Hall Ave. Two-story brick; owner, L. H. Seymore; architects, Shea & Shea; contractors, M. Fennell & Son; signed, June 5; filed, June 10; cost $6,235.

Market near City Hall Ave. One-story brick; owner, Henry Schmeidell; architects, Mathilson & Howard; contractor, R. Ringrose; signed, June 14; filed, June 16; cost $4,195.

Merritt bet. Denver and Hattie. Two-story frame; owner, Edward McBride; contractor, R. O. Davis; signed, June 21; filed, June 22; cost $2,950.

Minnesota near Butte. A two-story frame; owner, Jas. Flanigan; contractor, Ed. Mooney; signed, June 7; filed, June 10; cost $2,675.

Mission near 30th. To build; owner, Gottlert Arnold; contractor, H. K. Schmuckert; signed, June 6; filed, June 12; cost $5,849.

Mission near 5th. Elevator; owner, Emma Lolor; architect, Chas. Geddes; contractors, Wm. H. Birch & Co.; signed, June 27; filed, July 1; cost $1,755.

Oak near Buchanan. Additions and alterations; owner, Robert Taylor; architect, Edward J. Vogel; contractor, Robert Currie; signed, July 1; filed, July 5; cost $1,829.

Octavia near Grove. Plumbing two buildings; owner, P. L. McCure; architects, Pissis & Moore; contractor, E. Moenning; signed, May 12; filed, May 25; cost $2,150.

Octavia near Grove. Painting; owner, P. L. McCure; architects, Pissis & Moore; contractors, Smith & Daley; signed, May 12; filed, June 25; cost $1,100.

O'Farrell and Bayley Place. Iron work and tiling 6-story brick; owner, B. Curtaz; architects, John & Balezynski; contractor, Western Iron work; signed, June 17; filed, June 19; cost $10,523.

O'Farrell and Bagley Place. To build; owner, Benjamin Curtaz; architects, John & Balezynski; contractor, Adam Miller; signed, July 3; filed, July 3; cost $27,500.

Parker and Henderson Ave. A four-story building; owner, Albert Meyer; contractor, G. G. Gillespie; signed, June 8; filed, June 10; cost $3,250.

Pennsylvania Ave. near Sierra. A cottage; owner, Wm. L. Nolan; contractor, T. F. Mitchell; signed, June 12; filed, June 12; cost $1,880.

Pierce near Oak. To build; owner, Mary G. Murasky; architects, Martens & Coffey; contractor, J. O'Brien; signed, May 16; filed, May 17; cost $8,490.

Pine street No. 2016. Alterations, etc.; owner, Mrs. M. E. Pleasant; contractor, S. C. Murray & Co.; signed, June 8; filed, June 8. cost $5,135.

Plymouth and Lagamore. Additions, owner, P. Pellegrini; architect, L. Morrison; contractors, Morrison & Cook; signed, June 21; filed, June 27; cost $1,330.

Sacramento and Central Ave. Sundry mill work; contractors, N. Parish & Co.; signed, May 12; filed, May 27; cost $1,307.

Sacramento near Polk. Carpenter and plumbing; owner, J. Cazour; architects, Townsend & Wyneken; contractor, Robert Trost; signed, June 8; filed, June 12; cost $2,465.

Sacramento near Spruce. To build; owner, C. P. Fonda; contractor, Phillip Rive; signed, June 12; filed, June 13; cost $2,500.

San Jose Ave. near 26th. All work to build six flats; owner, E. A. Culling; contractor, Jas. Norris; signed, June 10; filed, June 14; cost $5,685.

Seventh near Bryant. Carpenter, mill and mason work; owner, Hayfield & Helling; architects, Townsend & Wyneken; contractors, Brodt & Bateman; signed, June 8; filed, June 9; cost $14,000.

Seventh near Harrison. Two-story frame; owner, Patrick Quinn; contractor C. A. Henderlong; signed, June 24; filed, June 26; cost $2,325.

Seventh near Bryant. Painting and graining; owners, F. Heydenfeldt and Z. O. Hellings; architects, Townsend & Wyncken; contractor, Wm. R. Eaton; signed, June 28; filed, July 5; cost $1,058.

Seventh near Bryant. Plumbing; owners, F. Heydenfeldt and Z. O. Hellings; architects, Townsend & Wyneken; contractor, G. C. Sweeney; signed, June 29; filed, July 5; cost $1,225.

Sickles near Scars. To build; owner, G. A. Gibbing; architect, D. M. Duel; contractors, Bates & Deuel; signed, June 26; filed, June 28; cost $1,100.

Steiner near Ellis. Raising, moving, etc.; owner, F. Knoppnacker; architect, A. C. Lutgens; contractor, James Geary; signed, June 28; filed, July 5; cost $1,375.

Tenth Ave. A cottage; owner, Chas. Boehringer; architects, John & Balezynski; contractor, Emile Hoelle; signed, June 14; filed, June 16; cost $2,010.

Washington and Devisadero. All work except plumbing; owner, Estate of F. Merrifield; architect, E. R. Swain; contractor, J. T. Logan; signed, June 6; filed, June 8; cost $6,123.

Washington and Devisadero. Plumbing; owner, Estate of F. Merrifield; architect, E. R. Swain; contractor, J. T. Logan; signed, June 6; filed, June 8; cost $495.

Washington near Walnut. To build; owner, Lillian E. Suydam; architect, Chas. I. Haven; contractor, Jas. McLean; signed, June 21; filed, June 22; cost $5,470.

Washington near Jones. Plumbihg; owner, Mrs. M. Wolf; architects, Pissis & Moore; contractor, R. A. Vance; signed, June 21; filed, June 24; cost $1,475.

Washington near Buchanan. Alterations; owner, John A. Wright; architects, Percy & Hamilton; contractor, F. W. Kern; signed, June 20; filed, June 27; cost $3,390.

York and 24th. Two-story frame; owner, Adam Herman; contractor, H. P. Conrady; signed, June 13; filed, June 13; cost $4,650.

ALAMEDA COUNTY.

Adeline near 5th, Oakland. Cottage; owner, M. Studewiskl; contractor, A. J. Wood; signed, June1; filed, June 5; cost $1,287.

Blake near Grant Ave. A cottage; owner, F. W. Bauer; contractor, J. J. Rose; signed, May 27; filed, May 27; cost $1,585.

Brush near 22d, Oakland. To build; owner, C. Moran; architect, E. J. McManus; contractor, C. S. Barnard; signed, June 24; filed, June 26; cost $1,651.

Colway near LeConte Ave., Berkley. Two-story frame; owner, R. H. Wetmore, Jr.; architect, R. H. Wetmore, Jr.; contractor, J. F. Meyers; signed, June 20; filed, June 23; cost $2,155.

Eighth and Filbert, Oakland. Two-story frame; owner, M. J. & F. Toushard; architects, W. T. Veitch & Bro.; contractor, A. E. Fake; signed, June 26; filed, June 27; cost $500.

Everett and Central Ave. Two-story frame; owner, E. Z. Garette; architect, G. A. Bordwell; contractor, D. S. Brehant; signed, June 28; filed, June 29; cost $2,275.

Filbert near 14th, Oakland. Alterations and additions; owner, M. E. Coogan architect, H. Burns; contractors, Gardner & Hayden; signed, June 7; filed, June 21; cost $1,250.

Filbert near 24th, Oakland. One-story frame; owner, M. Meyers; contractor, P. J. Brophy; signed, June 19; filed, June 28; cost $2,035.

Filbert near Encinal, Oakland. To build; owner, G. E. Randolph; architect, H. F. H. Brown; contractor, A. E. Fake; signed, June 26; filed, June 27; cost $1,895.

Fruitvale lot 16th. One-story frame; owner, C. T. Slamberg; architect, W. M. Campbell; contractor, A. E. Fake; signed, June 22; filed, June 27; cost $1,390.

Fourteenth near 26th, E. Oakland. To build; owner, J. Anderson; architect, C. L. Corregan; contractor, C. C. Burke; signed, June 7; filed, June 9; cost $2,120.

Haight near 7th, Alameda. To build; owner, A. E. Hoffman; contractor, A. R. Denke; signed, June 23; filed, June 24; cost $1,600.

Lot 10 block E. L. V., Oakland. Two-story frame; owner, W. W. Garthwaite; architect, J. C. Newsom; contractor, T. G. Krownick; signed, June 19; filed, June 28, cost $3,642.

Park near Lincoln Ave. Addition to Pacific Hotel; owner, M. Debret; architect, J. Lath; contractors, Ryus & Underwood; signed, June 16; filed, June 21; cost $1,400.

Rose and Shattuck, Berkeley. To cottages; owners, W. F. & H. Lingaid; architect, Geo. A. Emburg; contractors, Ryus & Underwood; signed, June 19; filed, June 21; cost $2,658.

Santa Clara Ave. Two-story frame building; owner, J. M. Raun; contractor, A. W. Cornelius; signed, May 29; filed, June 1; cost $4,000.

Seventh street. Two-story frame, including fourteen stores; owner, J. Bruguiere, architects, Smith & Freeman; contractors, Hebert & McLeod; signed, May 29; filed, June 9; cost $20,500.

Santa Clara Ave. One-story frame; owner, A. M. Jenkins; contractor, A. R. Denke; signed, June 14; filed, June 14; cost $2,284.

San Antonia Ave. near Union. To build; owner, L. Raschen; architect, N. P. Fisher; contractors, D. Straub & Son; signed, May 27; filed, June 1; cost $3,200.

Second Divison street. Carpenter work; owner, Joe Arenat; architect, W. Veitch; contractor, J. F. Meyers; signed, June 21; filed, June 21; cost $3,750.

Sonoi. To build; owner, J. E. McElrath; architect, H. Wharton; contractors, Weber & Rohler; signed, June 2; filed, June 2; cost $3,350.

Third near Cypress, Oakland. One-story frame; owner, J. Milley; architect, H. Gelifuss; contractors, Weber & Rohler; signed, June 2; filed, June 2; cost $2,222.

Twelfth and Washington Ave., Oakland. Carpenter work; owners, H., S. and F. Kahn; architect, W. J. Mathews; contractors, Price & Rush; signed, June 5; filed, June 12; cost $9,355.

Webster and Haight. Two-story frame; owner, Mrs. J. Schmitt; contractor, A. R. Denke; signed, June 12; filed, June 12; cost $6,250.

THIS journal is prepared to take charge of rendering perspective drawings in pen and ink or color. Charges will depend on size and kind of drawing wanted.

Upon receipt of plan and elevations, with a description of what is wanted, we will submit our estimates for the performance of the work.

IN another column will be found an interesting talk, delivered by invitation of the San Francisco Chapter of the American Institute of Architects, by Mr. G. Morin Goustiaux, on the present status of architects and architecture in France. In some particulars the practice of the profession there has certain advantages over the customs in vogue in this country; notable in regard to the honesty of both patron and architect in the manner of conducting and judging competitions.

In this country we regret to have to say, the majority of building committees endeavor to secure gratis, the best ideas of the profession, by dangling a hook seldom baited with anything more substantial than contingent promises. If cash prizes are offered, they are usually inadequate to properly compensate an architect for a serious study of the problem, and are often tied up with the condition that the premiated designs shall belong to the committee. As long as this method succeeds, it will be useless for architects to hope for a better.

On the other hand the architect who enters a competition, usually does so with the expectation or at least the hope of securing by personal means enough influence to secure a decision of the committee favorable to himself, irrespective of the merits of his design. Thus the cause of progress in architecture is seriously retarded, and instead of architects striving to arrive at the best possible solution of the problem submitted to them, they are too apt to slight the design, and trust to personal considerations for achieveing success.

Another advantage the competing architects enjoy in France, is the fact that the awards of prizes are made on the recommendations of a jury of experts. Who would think of electing a doctor to the Supreme Bench, or consulting a

lawyer in case of sickness? yet the parallel holds good in a majority of cases here, as it is the exception rather than the rule when a building committee considers it necessary or advisable to secure professional advice on the merit of plans submitted.

THE City Trustees of Alameda deserve great credit for the model advertisement for Competition Drawings for their proposed New City Hall, the conditions of which were arranged with great fairness. The result has been that they have received the largest number of well thought-out plans and from the largest proportion of standard architects of any competition that has been held of late.

The competitors generally have also reciprocated, as almost without exception no attempt has been made by them to obtain any undue advantage over their fellows by going beyond the size and quality of the Drawings laid down in the Conditions.

A reception was tendered by the San Francisco Chapter of the American Institute of Architects to Mr. G. Morin Goustiaux, on the evening of Friday, July 28th.

Mr. Goustiaux was delegated by the city of Paris as its representative at the World's Columbian Exposition, and previous to returning to France, passed some few weeks in this city.

Mr. Goustiaux, who is a native Californian, renewed old acquaintances in the Chapter and made new ones, and entertained and instructed his professional brethren by a detailed description of the conditions under which architects and architecture flourish in France.

He described the requirements and examinations necessary to enter the *Ecole des Beaux Arts* and the difficulties to be overcome by the students before graduating, when they are entitled to a diploma, issued by the Government, and the option of entering the public service.

The requirements are severe, and a bright young man is doing well if he secures his diploma at the end of six or seven years—about twelve each year reach their goal; seldom at less than thirty years of age; should they chose to enter the public service, they first take the position of *Conducteur* of work, are afterwards promoted to that of *sub-inspecteur*, then to be *inspecteur*, and finally at the age of forty to forty-five years of age to the position of Architect, and are then given charge of such repair work as may have to be done.

For important works there is a corps of ten to fifteen architects under the direction of the *Inspecteur General* of Paris.

In competitions for public improvements the committee of awards is composed of a certain number chosen by the competitors themselves, a representation from the *Societe Centrale* (the principal architectural association of France) and a special commission of prominent architects. The method employed to arrive at a decision is first to reject all designs that do not conform to the programme, then to reject those that are seriously defective in any important particular, and continue this process of elimination till the number of designs that remain are reduced to the number of prizes offered—and these are then classified in their order of merit; and to the credit of the committee, Mr. Goustiaux states that their decision is almost universally acknowledged among the competitors as being just.

In regard to Architectural Societies there are three—the most important being the *Societe Centrale*, with branches in other departments of the country. This society is very exclusive, and very difficult to enter. No contractor, nor any one who has ever been a contractor is eligible—a certain standard of work must have been executed by the applicant. The customs of the profession as determined by this society are taken as precedents by the courts, and judges frequently refer to the society for information as to the customs, and govern their decisions according thereto—the schedule of material and prices fixed by this society are authoritative.

These is a smaller society consisting of *architects diplome* and a third society to which architects and builders are admitted indiscriminately.

Important public works over 500,000 francs in value is usually decided by competition, the competition being confined to Frenchmen.

A vote of thanks was tendered Mr. Goustiaux for his pleasant talk and the meeting adjourned with mutual good wishes.

A PERFECT ELECTRIC INSTALLATION.

IF any doubt existed as to the advisability of placing the details of electric wiring under the charge of an independent electrical expert, that doubt will be eradicated upon reference to the San Francisco building of the Mutual Life Insurance Company of New York, of which Mr. Clinton Day is architect and of which a full page illustration was presented in the June number of the CALIFORNIA ARCHITECT AND BUILDING NEWS. As most of our readers are aware, this building is a thoroughly modern fire-proof structure of steel, terra-cotta and pressed brick, nine stories in height. No more difficult construction in which to place electric wiring exists, yet the electric work therein installed is a marvel of simplicity and perfection.

The experiences which have been had with the electrical work of other buildings of similar construction in various portions of the country was taken advantage of in designing this installation. Its main features resemble closely those of the incandescent wiring of the Mills buildings, San Francisco, yet the wiring of the Mutual Life building may be considered as the perfection of the idea carried out in the first named structure. In the Mills building, for instance specific provision is made for electric light conductors only. All other wiring such as telephone, district telegraph, time service or bill circuits, are placed together in a recess on top of the incandescent ways, while in the Mutual Life building a separate recess or groove or tube is provided for each distinct class of wiring.

Throughout the whole system, the inviolable idea which has been carried out in that all wiring shall be concealed and hence unobtrusive, yet always accessible.

The wiring usually placed in a large modern office building may be divided into two general classes, namely: electric lighting circuits and signal circuits. It is important for several electrical reasons, chief among which are that immunity from fire and reliability are effected, that the wires of these two classes of circuits be kept distinct from each other. From a mechanical standpoint, running separate ways for distinct classes of circuits is necessary to facilitate handling and what is sometimes equally important it keeps concerns from interfering with wires of other and perhaps rival companies. In the Mutual Life building it was found that the best service would be attended by dividing the circuits into four groups; electric lighting, telephone, bells, and district telegraph and clock wiring. These circuits run to each room of the building; every foot of wire is concealed, every foot is accessible and moreover any wiring may be carried from any room in the building to any other room on any floor without breaking plaster or without exposing the conductors in any way. It is difficult to conceive anything more perfect.

From the engine room in the basement is run an electric riser-way which continues in a straight line to the top floor paralleling the elevator shafts. In this riser-way are run all the electric circuits of the building. The telephone circuits, for instance, come into the building from the under-ground cables, the cable being continued through the basement and up the electric shaft to the fourth floor where it terminates in two twenty-five pair cable heads, and whence the telephone circuits are distributed to the various rooms as will be described. Similarly, the under-ground incandescent service of the Edison Light and Power Company is brought into the basement and connected up to a simple marble switch-board. From this switch-board independent circuits are run to each floor and each hallway in the building. Throughout the entire structure, with the single exception of in the corridor moldings, the insulating tubing of the Interior Conduit and Insulation Company is used. Separate tubes are run through the riser-way from the switch-board to each floor and each hallway for the incandescent system while special tubes are similarly run for containing the signal wires.

In the lavatory of each floor is a cabinet which opens directly into the electric shaft and in which is placed the plug switches and cut-outs for each particular floor. About each hall is placed molding run in line with the casings of the doors and windows and capped and finished in oak to match. The molding is in two parts, capping and backing, the latter containing five grooves, two for electric light wires, one for telephone wires, one for district telegraph and clock wires and one for bell wires, and each room is supplied with a separate tube from each groove. The room cut out is set in flush with the backing of the molding so that the grooves of the cut out and molding are in line. From the cut out conduit tubing is carried down to the room switch, thence to the fixture. A valuable innovation will here be noted. No safety devices are used in the fixture. Each fixture circuit is contained in an independent conduit tubing carried through a switch from a separate cut out in the molding to the fixture direct. Both the fixture and circuit are protected by the safety cut out in the molding, hence if the fuse blows it may be replaced in the hall without inconvenience to the tenant or sometimes without even entering the room affected. The cappings of the moldings are all secured with screws and although it extends entirely around the halls it is neither conspicuous nor a disfigurement in any way.

In each room, the electrical service is confined to two polished oak service blocks. The smaller, placed near the door contains the electric light switch and a push button which may be connected with any part of the building at any time. To the larger service block, also of polished oak 14x16 inches, is brought the messenger circuits of the Postal and Western Union Telegraph companies and the San Francisco District and American District telegraph companies respectively, while but a few inches away and at the proper height is a conduit tubing leading to the telephone groove in the corridor molding so that the tenant may have a telephone placed without disfigurement whenever desired. In order that the idea of accessibility of all circuits should be carried out, not an inch of wire of any description, nor even a fish string, was placed in any tube until after the tubing was set in place, and not an inch of electric light wire was inserted in the tubing until after the plastering was finished. All the incandescent circuits in the building are of the well known Grimshaw White Core insulation. Flush, push wall switches of the Cutter Specialty Company, Philadelphia, are used throughout while the hall circuits are controlled by the S-C flush key switches of the same company. In these the janitor alone holds the key by means of which the switch may be operated.

The entire electrical work was installed by the San Francisco office of the General Electric Company under the electrical expertship of Mr. Geo. P. Low.

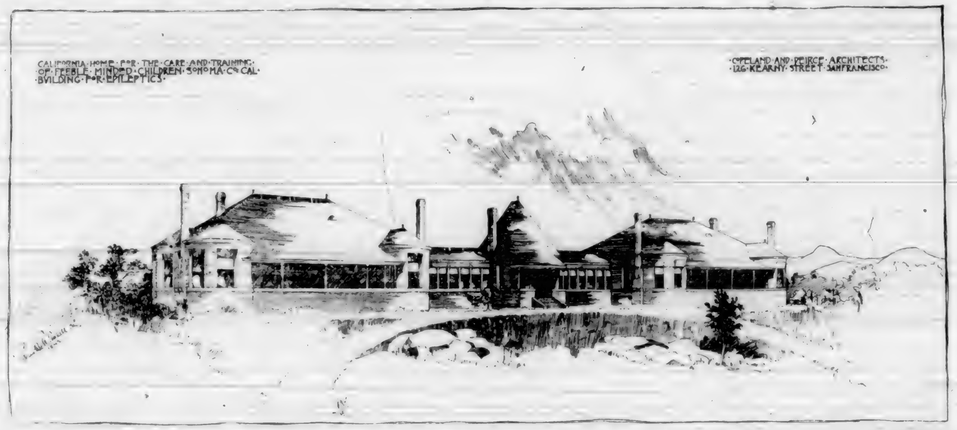
FIGHTING FIRE WITH GASES.

AN interesting experiment in fighting fires was tried at Salem, Mass., last week, and it appeared to be successful. All the apparatus used in the experiment was a sheet-iron cylinder about three inches in diameter and sixteen inches in length. This cylinder was charged with gases and chemicals sufficient to throw a stream half the size of an ordinary lead pencil about twelve feet continuously for five or six minutes. After the cylinder had been charged a box eight feet long and four feet high by four feet wide was obtained, and the inside smeared with tar. Then, to add to the inflammable quality of the material, a half-gallon of kerosene oil was sprinkled upon it and the whole thing set on fire. The heat created by the fire was intense, and those who were witnessing the experiment had grave doubts as to the success. After the fire had burned the boards nearly half through, the contents of the little can were turned on and in less than a minute the flames were extinguished. The test was certainly a severe one. The inventor of this extinguisher thinks that in time he will be able to perfect a device for fighting large fires, and that eventually gases will take the place of water entirely in the fire departments.—*Fire and Water.*

THE RE-INFORCEMENT OF CONCRETE BEAMS BY TWISTED IRON FOR FIRE-PROOF FLOORS.

WHE reference made in the May number of the CALIFORNIA ARCHITECT to the use of Twisted Iron incorporated in Concrete, has called out some inquiries as to the nature and extent of the tests so far applied to this mode of construction. Though first introduced upon this Coast but little has been published here respecting this new departure in fire-proof building.

The Museum at the Standford University was not the first structure where this method was employed, but the concrete beams supporting the heavy dome, have the longest span yet produced, forty-five feet. Another notable example is the California Academy of Sciences on Market street, where five floors covering an area of 50,000 square feet are so constructed. The span ranges as high as thirty feet, and there is also a projection of three feet of concrete over the central area, supporting an iron railing at the outer edge, and a walk for visitors. The floors were estimated to carry with



safety 250 pounds per square foot. One section, 15x22, was tested with a uniform load of 415 pounds per square feet, and the load was left on one month. The architects reported the extreme deflection at the center as only one-eight of an inch. Contractors and workmen were distrustful at first, but their confidence became unbounded before the completion of the work. The saving over the usual mode is estimated at fifty cents per square foot.

Touching the weight of these floors, as compared with iron girders and hollow tiles, the first impression that the concrete must necessarily be much heavier, is found incorrect. For when the span is of usual length, and the required strength of moderate limit, the weight per square foot is less with the new construction. For example: with spans of fifteen to twenty feet, and a safe load of seventy-five pounds per square foot, the saving in weight is about forty per cent over iron girders and hollow tiles. With a load of 125 pounds it is some twenty per cent.

This economy is doubtless due to the fact that the bond between the twisted iron and the enveloping concrete is so perfect and continuous as to give the effect of a homeogenous beam, and that the tensile strength of the iron bar is utilized.

Ordinarily in the use of iron with concrete the strain has been concentrated at a single point by the employment o nuts and washers. By twisting the iron before it is imbedded in the concrete the strain is diffused equally through the length of the bar, while it is firmly held at all points by the enveloping mass.

An incidental advantage of the twisting is that therby all imperfectly laminated iron is at once detected, and the defect exposed, ensuring the employment in practical use of only a high quality of iron.

In the more common forms of construction the major element has been the iron beam, whose lower cord was exposed, necessitating additional protection below against the action of heat. By substituting the concrete beam as the chief factor, the iron used is so incorporated within the body of the stone as to be amply protected without extra cost. Moreover the iron girder is an expensive form, while the very simplest and cheapest is the flat or square bar.

The claim that cold twisting actually adds to the strength of the bar, rests upon somewhat exhaustive experiments conducted by Lieutenant F. P. Gilmore, U. S. N. (Government Inspector of Iron and Steel for war vessels under construction at San Francisco) and by the College of Mechanics of the University of California at Berkeley, also at the celebrated Low Moor Iron Works, England.

Lieutenant Gilmore found that common commercial iron ¾ inch square, being given 1½ twists per lineal foot gained seventeen per cent in tensile strength; given 3¾ twists, twenty per cent, and six twists gained twenty-four per cent.

The best Norway Iron given six twists per foot, gained from fifty to fifty-three per cent in tensile strength.

Similar experiments at the Low Moor Iron Works with ¾ inch round iron, showed twenty-two per cent gain for 1½ twists per foot; thirty-six per cent with 2½, and forty-one with three twists, which was as far as the experiments noted were carried.

The latter experiments conducted by the University of California gave similar results, with one important fact ascertained, namely: that a suitable interval between the twisting and the testing gave a much greater gain. Three-quarter inch iron turned down to ⅝ was given six twists per lineal foot. Twisted while hot there was a small loss in tensile strength. Twisted cold and tested immediately, the gain ranged from thirty-three to forty-three per cent. Twisted cold and allowed to remain five days and then tested, the increase in tensile strength of the same quality of iron was from forty-seven to fifty-nine per cent, or an average of fifty-three per cent.

It would seem that advantage might be taken of this important augmentation of tensile strength in many places. Bridge builders, as well as workers in concrete, would do well to inform themselves fully upon this claim.

SCULPTORS OF THE WORLD'S FAIR.

BY J. H. GEST.

WHATEVER may be the success of the World's Columbian Exposition as an exhibition of the liberal and mechanical arts, or of natural products, it has achieved in one respect a result that could not reasonably have been expected, and certainly could not have been foreseen in its actual magnitude. In 1889 France presented to the world an architectural and artistic spectacle unapproached by former exhibitions, and until within a few months past the last French exhibition remained the ideal in the public mind. Almost no one had thought of an American exhibition which in the architectural beauty of its buildings, and especially in their sculptural decoration, should in any way rival Paris of 1889.

Conceding the ability of our architects to carry out their part of the task, where were the sculptors capable of acceptably decorating the buildings? To do this work required not only one man, or a half-dozen men, but a score or more of trained sculptors supported by a corps of personal assistants, and a small army of subordinate modelers and molders. They must be men fertile in the invention of a kind of ornament for which comparatively little use has hitherto been found in this country—not men capable of modeling merely detached statues, but able also to do it in harmony with architectural surroundings. This aspect of the sculptor's art is almost entirely unknown to the Americans as a people, who for want of knowledge have really no conception of its uses and its value in civic and national life. Even those of us who have occasionally the good fortune to travel in Europe, and who bring back in memory, and in photographic scrap-books, impressions of the architectural and sculptural interest of European towns large and small—even they drop back into the practical course of the overpowering commercial and mechanical movements peculiar to our civilization, and ere long become content with the bald surroundings of brick and stone amidst which the large percentage of our population live and labor. If even these favored few do not sufficiently value the presence of beauty of sculptural form as a leaven in the hard commonplace of our cities, how can the less fortunate, to whom this beauty is as unknown as though it had no existence?

It may be asked: What is the value, to a civilization like ours, of the esthetic expressions in form which are the products of the sculptor's art? Some years ago esthetics seemed entirely apart from the proper course of our lives. The usefulness of art was practically unknown, and even recreation was indulged in either under compulsion or with an unhealthy excitement. It is now generally admitted that of all the means of mental recreation none are so nearly inexhaustible as art, and in none can the restful influence be so ever-present. This is acknowledged in our strenuous efforts to introduce beauty into the most humble of the industral arts, which is the marked characteristic of our industrial advance since 1876. All of this reaches the homes of the people and introduces an esthetic leavening of growing force. Art museums and galleries of paintings and sculpture are carrying the movement forward on a higher plane. But we have just begun to appreciate the fact that buildings, public and private, should themselves teach the value of beauty of proportion, of mass, of form in outline and surface, and even of color. Here the sculptor's work joins that of the engineer, architect and builder. When the capitalist has employed the engineer to plan his enterprise, the architect to give his building not only adaptability to its use but also a character that shall be its entity as compared with others, then steps in the sculptor to ornament, until the whole shall possess not only utility but a beauty which shall make acceptable and perhaps emphasize that very utility. The finished work is thus by its attractiveness made even more efficient for the purpose for which it was intended. Other things being equal, the increased rental of the building will pay the interest on the cost of the sculpture. And the city with fine public squares, artistically dressed with statuary in appropriate architectural settings, will thrive as compared with the rectangular, monotonous, bald, utilitarian town, provided the location and other commercial conditions be not too unfavorable. Further, this ornamentation of a city stimulates its pride—a force constantly active in advancing a community. The streets should, so far as public and private enterprise can make them, be as popular museums full of object lessons that will tend to make good citizens. One of those lessons is the evidence of thrift given by the bustling crowd, another is the stability of buildings, but still another should be the appropriateness and the architectural and sculptural beauty of these same buildings. All this provision for his enjoyment of life tends to add something to the capacity of the citizen for activity.

There is no doubt as to the impression that will be made upon thousands of visitors to Chicago this year. The beauty of grand buildings harmoniously grouped in Jackson Park, the charm of decorative sculpture, the richness of public places and avenues abounding with statuary, create an unsuppressable longing that something of this, apparently so permanent, yet really so temporary, may remain as a lasting impression upon our people. While not attempting to distribute the credit for the beauty of these buildings and grounds, we may well recall that, when the use of Jackson Park—then largely swamp-land— was under discussion, it was Frederick Law Olmstead, the landscape architect, who conceived the plan of dredging lagoons and canals to secure sufficient earth for fills upon which to place the buildings, thus meeting the practical demands of the occasion, and providing the opportunity for artistic effects of land and water. Then followed the grouping of the buildings, of which much was prompted by Mr. Root, though conferences among the chosen architects led to the arrangement finally worked out, and to the adoption of the prevailing style of classic architecture. Coming to the sculptural ornamentation of the buildings and grounds, we should probably find Augustus St. Gaudens the dominant power, though his own work is limited to the gilded "Dina" on the main dome of the Agriculture building, whither it was removed from the tower of the Madison Square Garden, New York. These names, coupled with that of D. H. Burnham, the director of works, are those one hears from all who speak of the enterprise.—*The Engineering Magazine.*

THE COGSWELL FOUNTAIN IN BOSTON.

IT will be remembered, says the *American Architect*, that a few years ago, a certain Dr. Cogswell, of San Francisco, we believe, made to the City Government of Boston, as he already had to other municipal bodies, a proposition to erect on the Common, and present to the city, a fountain, consisting of a bronze figure, sheltered under a classical pavilion of granite, and furnished with an appropriate pedestal and inscriptions. No conditions were annexed to the offer, and the gift was accepted, and the fountain and pavilion duly erected on the Common. The site assigned to it was not a happy one, and the structure itself, although tolerably well executed, did not please the educated taste of the citizens, while, the name of the donor being rather conspicuously displayed on it, an idea became current that it was intended as an advertisement of the donor's business. However that may have been, the popular dislike to the affair became so marked that, after four or five years, the City Government appropriated money to have it removed.

ILLUSTRATIONS

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

VESTA DEL MAR—to be erected corner Jones and California streets, an apartment house of 250 rooms, arranged in thirty suits. To be strictly fire-proof. Material, light press brick and terra cotta. Cost $320,000. Reid Bros., architects.

THE proposed building for the San Francisco *Examiner* is by Willis Polk, architect.

SKETCH of stable for A. B. Spreckles is by C. I. Havens, Architect.

DEATH OF COLONEL R. T. AUCHMUTY.

EVERY architect, and every one who has the good of his fellow citizens at heart, must mourn the loss of Colonel R. T. Auchmuty, who died at Lenox, in consequence of an amputation made necessary by a painful disease of the leg, from which he had long suffered. Colonel Auchmuty was a grandson of one of the first rectors of Trinity Church in New York, and was throughout his life identified with that church and with the charitable and religious undertakings connected with it. He served in the army during the Civil War retiring with the rank of colonel. He was educated to the profession of architecture, and was for some time a partner of James Renwick, the architect of Grace Church, but, being possessed of an independent fortune, and finding ways in which he could be of more use to his fellow men than in the practice of his profession, he came of late years to devote himself entirely to his various charitable works, of which the greatest was that of the establishment of the New York Trade Schools. From the time of his first acquaintance, through his professional work, with mechanics of the old and new schools, Colonel Auchmuty had observed the unfavorable effect upon the younger men of the limitation or abandonment of the old apprenticeship system, and the substitution, for the instruction and control of the masters, of the tyranny of trade-unions. In New York, as in other large cities, the unions are almost completely under the control of foreigners, who favor their compatriots, to the exclusion of the native-born, and Colonel Auchmuty found his young fellow-countrymen not only shut out of employment in New York, to make room for foreigners, but prevented from learning a trade which they might practice elsewhere, by the limitation of the number of apprentices in the shops, rigorously enforced by the unions, and the absence of any other provision for training them. Finding that the same difficulty had been met abroad by the establishment of schools, under Government patronage, for teaching the manual arts, Colonel Auchmuty determined to see whether something similar could not be done in this country by private effort, and, securing a small building in New York, he employed instructors and opened a school where young men could be taught carpentry, masonwork and house-painting. The school was not free, a small tuition-fee being charged, and there was every year a deficit to be met, which Colonel Auchmuty and his wife paid. The first year the school was small, but it grew rapidly. Not only was practical workmanship thoroughly taught, but theoretical instruction was given in the properties of materials and elementary statics, and drawing was taught to all the pupils. Very soon, the school increased so much that it was necessary to erect new buildings, which were constructed by the pupils. New courses were added, and the school now has about six hundred pupils, of the best type of American adolescence. It is hardly necessary to say that an institution which taught young men to work and think excited from the first the hatred of the organizations which look upon anarchists as the true labor-reformers, and the walking-delegates tried open violence, as well as their arts of secret terrorism, to destroy the schools. Finding that the schools could not be closed by these means, they closed the shops against the graduates of the schools, ordering every shop "struck" that employed one of them. Colonel Auchmuty met this step by resuming his old profession, and making plans for a considerable number of buildings, which were carried out by the school graduates. After this, the labor organizations, finding that they had aroused a public feeling which it was advisable to allow to subside, ceased active hostility, and the relations between them and the trade schools, though far from cordial, are not now belligerent. On being attacked by the ailment which finally caused his death, Colonel Auchmuty was obliged to leave the work of managing his schools mainly to others, greatly to his regret, but, as he himself said, this has proved a certain advantage, as their continuance is in that way better assured, so far as the system of instruction is concerned, while they were recently firmly established financially, by the generous endownment of half a million dollars, presented them by Mr. J. Pierpont Morgan. Before his death, Colonel Auchmuty, with his wife, added one hundred and sixty thousand dollars to the endowment, this being outside of the seventy thousand dollars which they had already devoted to the schools.—*The American Architect and Building News.*

NOTES & COMMENTS.

Clinton Day, Architect, has removed his office to the fine new building SE corner California and Sansome Sts.

Mr. Geo. P. Low, Electrical expert for the Pacific Insurance Union and who is well known to architects, left for an extended business trip east on August 10th. While absent will attend the meeting of the Underwriters' International Electric Association, of which committee he is a member. Mr. Low will also sit as delegate to the World's Electrical Congress to be held in Chicago beginning August 21st.

The first building erected by the London Council with their own men and without the intervention of a contractor has been brought to a successful issue. The new school building at Crossness was advertised in the usual way and the lowest tender obtained for a contractor was $10,940. The estimate of the Council's architect was $8,440 and the work was actually executed for the sum of $8,310. The example, however, is on too small a scale to prove anything very much at present in regard to the superiority of this system of doing work.

BRITTON & REY PHOTO LITH

VOL. XIV Nº 8 AUGUST 1893.

To the Editor of the California Architect:

AT a time when so much use is made of the Photographic method in the reproduction of drawings and the preparation of plates for the press, a glance backward may not be uninteresting in tracing the development of this process to its present state of perfection. To Mr. Joseph Dixon of Salem, Mass., the founder of the Joseph Dixon Crucible Co. of New Jersey City, N. Y., belongs the credit of this invention. His first experiments in this line were made at Salem, and so successful was he in reproducing a bank note that the bank officials declared it a genuine bill. Mr. Peabody, of the same place, when shown this result, was so convinced of the danger of this discovery, if the process became generally known, and fearing it might be applied for fraudulent purposes, he induced Mr. Dixon to go before the Massachusetts Legislature for the purpose of having a law passed that all bank notes should be printed in colors to prevent reproduction by the photographic process.

Mr. Dixon appeared before a committee of the Legislature, who evidently did not favor the measure; the chairman after hearing Mr. Dixon, remarked: "Well, Mr. Dixon, you tell us that no one but yourself and Mr. Peabody know of this process?" "Certainly," replied the inventor. "Then sir we shall look to you and Mr. Peabody if any counterfeit bills appear."

This naturally angered Mr. Dixon and he resolved to publish the process and accordingly prepared an article for the *Boston Daily Advertiser*. On his way to the office he met a gentleman in Park street and informed him of his purpose. The gentleman said: "Mr. Dixon, you are naturally angry now, give me the manuscript, if you want it to-morrow after thinking the matter over, I will return it at your request."

Mr. Dixon told the writer of this article of the incident and added, "I never called for it and the manuscript may be in his keeping now."

Some years after this event, at a meeting of some scientific society, the process was announced as a recent English discovery; but Mr. Edward Everett of Boston, then United States Minister to the Court of St. James, at once claimed the invention as having been made in this country by Mr. Dixon; as positive evidence to this fact he showed the reproduction of a Latin manuscript with his own autograph and date, thus establishing the claim without a shadowof a doubt.

A. H. E.

DESIGNS ACCEPTED FOR MID-WINTER FAIR.

THE executive committee of the California Mid-Winter Exposition, has made the following choice of designs for the exhibition buildings:

Manufacturers and Liberal Arts, the plans of A. Page Brown. Mechanical Arts—Edward R. Swain. Agricultural and Horticultural—Samuel Newsom. Fine Arts—C. C. McDougal. The decision has yet to be made in regard to the Administration Building.

Ground will be broken on Thursday, August 24th, and the energy displayed and the enormous amount of preliminary work already accomplished afford the most satisfactory evidence that the great project will be made a great success. It only remains for the public at large to say how great a success.

TENDERS TO BE RECEIVED.

Treasury Department, Office Supervising Architect, Washington, D. C., July 25th, 1893. Sealed proposals will be received at this office until 2 o'clock P. M. on the 30th day of August, 1893, and opened immediately thereafter, for all the labor and materials required to put in place a complete Heating and Ventilating Apparatus in the U. S. Post Office, etc., Building at Sacramento, Cal., in accordance with the drawings and specification, copies of which may be had on application at this office or the office of the Superintendent at Sacramento, Cal. No convict labor nor the use of any product of convict labor will be allowed in this work.

Each bid must be accompanied by a certified check for a sum not less than 2 per cent. of the amount of the proposal. The right is reserved to reject any or all bids and to waive any defect or informality in any bid, if it be deemed in the interest of the Government to do so. All proposals received after the time stated will be returned to the bidders. Proposals must be enclosed in envelopes sealed and marked, "Proposal for Heating and Ventilating Apparatus at the U. S. Post Office, etc., Building, Sacramento, Cal.," and addressed to

Jeremiah O'Rourke,
Supervising Architect.

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute of Architects, meets second Friday of each month at 408 California street.
Geo. H. Sanders, Pres. W. J. Cuthbertson, Vice-Pres.
Oliver Everett, Sec. John M. Curtis, Treas.

Technical Society of the Pacific Coast, meets first Friday of each month at Academy of Sciences Building.
C. E. Grunsky, Pres. Charles D. Marx, Vice-Pres.
Otto Von Geldern, Sec. Geo. F. Schild, Treas.

California Electrical Society, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
Geo. P. Low, Pres. C. O. Poole, Vice-Pres.
Max Caspari, Sec. H. T. Bestor, Treas.

THE regular monthly meeting of the chapter was held on Friday evening, August 11th. The nomination of officers was postponed till next meeting.

The following communication was received from the Architectural Association of Southern California, and a committee of three, consisting of Messrs. Babson, Bestor and Curtis was appointed to confer with the committee from the Southern Association:

Los Angeles, Cal., July 26, 1893.
To the San Francisco Chapter
American Institute of Architects,
Mr. Oliver Everett, Secretary.

Dear Sir:—At a meeting of the Architectural Association of Southern California, held on the fifth day of July, it was resolved that a committee be appointed to confer with your association with a view of securing, should it meet its approval, the incorporation in the by-laws of both societies, rules governing the submission of drawings in competition for public and private works, in order that there may be uniformity of practice by architects throughout the State.

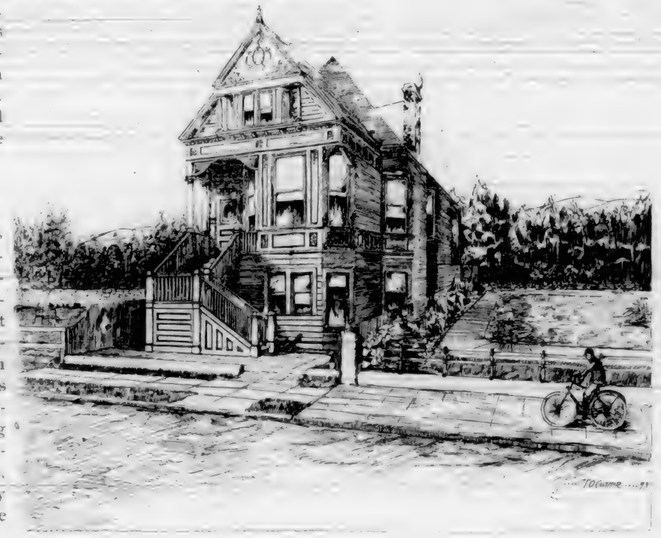
It is certain that the manner in which architectural competitions are generally conducted, securing as they do to public committees and too often to private individuals, elaborated drawings from architects of acknowledged ability, utterly without compensation, is one of the most serious evils with which we have to contend, having a tendency to cheapen all architectural services in public estimation.

Believing that concerted action by our respective associations, making it imperative on members to refuse submission of drawings except under the rules common to both will greatly advance the practice of our profession, we respectfully request you to submit this communication to the Chapter at the earliest convenient opportunity.

T. A. EISEN,
A. WACKERBARTH, } Committee.
A. B. BENTON.

"What's the matter, old man?" "Oh, I've just had a quarrel with my wife." "Well, forget and forgive." "I never can forgive her. You see I was in the wrong." "Then, in that case, demand an apology."—*Brooklyn Life.*

MODERN HOUSES—A new publication by J. Cather Newsom, architect, show a variety of modern residences designed with special reference to the requirements of California. The selections embraces a great variety of styles from the plainest to the most elaborate finish, and the different arrangements shown on the plans, will be of interest to those intending to build. Price $2.50, for sale by Osborn & Alexander.

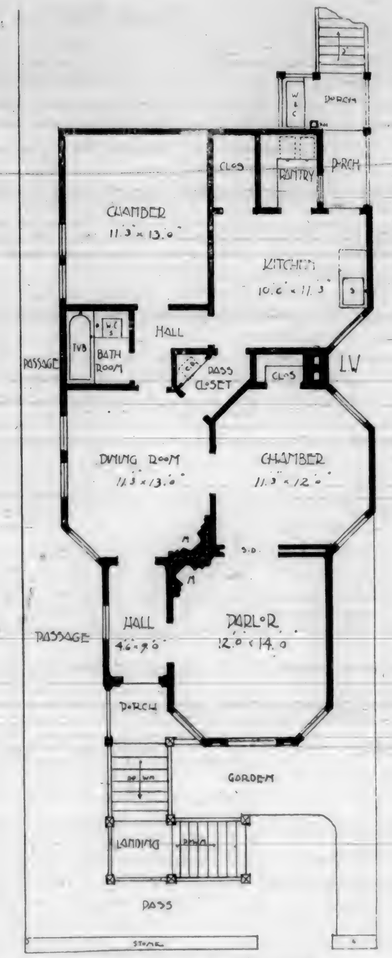


$1800 COTTAGE.

THE STUDIO, an illustrated magazine of fine and applied art. Published at 16 Henrietta St., Convent Garden, London.

This charming and truly artistic magazine cannot fail to please the art student as well as all lovers of the beautiful. The opening article in the July number entitled "Artistic Gardens in Japan" by Charles Holme, will be found very interesting, and illustrated with some charming bits of landscape. The "Leek Embroidery Society" will interest the ladies; while "The Art Magazines of America" will please the general reader.

THE PHOTOGRAPHIC TIMES—This excellent journal devoted to the art, science and advancement of Photography, comes to hand for July, under the heading of "Convention Number" with a charming portrait of H. R. H. the Princess Eulalia, said to be the best photographic portrait which her Royal Highness has had made in this country. The July issue is a double number containing twenty-four pages, but hereafter the regular issue will be increased by just one-third the present number of pages, and will contain sixteen pages instead of twelve.



PLAN OF $1800 COTTAGE.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

Modification of Building Contract.—Where one contracts to complete a house, ready for occupancy, within sixty days, according to plans which do not require the finishing of the second story and putting on the last cont of paint, the effect of a subsequent contract made after the sixty days have expired, to do the additional work, for an extra payment, is to waive the original stipulation to complete the work at a certain time, and substitute a stipulation for completion within a reasonable time.

Cornish v. Suydam, Supreme Court of Ala. 13 Sup. Ct. Rep. 148. 80

Decision of Architect in Building Contract.—Where a building contract provides that the work shall be done to the satisfaction of the architect, and that any dispute as to extra claims shall be referred to him, and that his decision shall be final, it is error, in an action by the builder on the contract, to refer to the jury such questions as to extra work and the performance of the contract, in the absence of evidence of fraud, or if the question of fraud is not submitted to the jury.

Guthat v. Gow, Supreme Court of Mich. 55 N. W. Rep. 442. 92.

Extent of Recovery on Mechanics' Lien.—In an action to foreclose a mechanics' lien it appeared that both parties had abandoned the contract when the house was partly built, and before the contractor had been paid anything, and that thereupon the owner had torn down the building and rebuilt it, using the same materials. The contractor was entitled to a lien for the value of the materials furnished by him, less the cost of tearing down the building.

Charlton v. Scoville, Supreme Court of N. Y. 22 N. Y. Supp. 863. 76.

Abandonment of Contract.—Where a building contract provided that if the contractors should fail to perform the contract in any particular, and the architect should so specify, the owner might give them three days' notice to perform, and in case of their refusal to do so within that time, the owner might terminate the contract. The architect having certified that the work was not being done according to the contract, the owner notified the contractors to remove their labor and materials, and to provide such materials as were called for in the specifications, and at the same time notifying them that he should terminate the contract, and taking from them the plans and specifications, the owner thereby abandoned the contract.

Charlton v. Scoville, Supreme Court of N. N., 22 N. Y. Supp. 884. 127.

Party Wall Agreement.—The casement of an adjoining lot owner created by a party wall agreement ceases when the wall becomes unfit either from age or accident. The provision in a party wall agreement that the rights of the parties shall continue so long as the wall shall stand, does not mean so long as any portion of the wall shall remain itself, but so long as the wall shall remain fit for use as a party wall, and therefore it does not violate a provision in the agreement that no perpetual right or casement shall be thereby acquired.

Odd Fellow's Assn. v. Hegels, Supreme Court of Ore. 32 Pac. Rep.. 679. 97.

Accepting Note Not a Waiver of Mechanics' Lien.—Where an agreement that where the work is properly done and the materials furnished, the owners were to give a note at three months from the date thereof, on the 20th of January the work was completed, and accepted by the owners. On the 12th of January they gave their note for a part of the contract, and on the 21st of January, another note for the balance due. The acceptance of the owner's note for materials furnished by the material man is not a waiver of his lien.

Jones v. Morris, Supreme Court of N. Y. 22 N. Y. Supp. 53. 92.

Mechanics' Lien on Land under Contract of Sale.—Where a contractor repaired a house at the request of an intending purchaser, who as the contractor knew, had only an oral contract or an option to purchase, and he was not misled by the owner, who did nothing to prevent the intending purchaser from acquiring title under his contract, he cannot claim a lien on the property as against the owner. He could acquire nothing by the foreclosure of his lien, except the right to be subrogated to the privilege to purchase the property, and they could not obtain that relief until he had tendered the amount which he was bound to pay to establish his right.

Thomas v. Ellison, Supreme Court of Ark. 22 S. W. Rep. 95. 111

Mechanics' Lien on Building on Leased Ground.—Where a lease of land contains no permission or provision giving the lessee, the right to construct any building or to put any machinery on the land, the land cannot be held for a mechanics' lien for a building erected by the lessee on the ground that the owner consented to its construction, since he was not in possession of the premises, and had no power either to dissent from or consent to such construction. The fact that the owner participated slightly in the construction of the building is not proof of such consent, when it appears that he was acting as agent of the company which had leased the land.

Havens v. West Side Elec. L. & P. Co. Supreme Court of N. Y. 20 N. Y. Sup. 764. 108.

Violation of Building Restrictions.—A clause in a deed of a lot prohibiting the erection thereon of any buildings other than dwellings with necessary out-buildings, such dwelling to cost not less than $2000, is violated by placing a tent on the lot, costing less than that sum, and used by the grantee and his family in the summer time as a dwelling, though they do not sleep therein. Since no dwelling house was erected on the lot by the grantee, a stable placed thereon cannot be placed thereon as a necessary out-building.

Blackemore v. Stanley, Supreme Court of Mass. 33 N. E. Rep. 689. (92.)

A HOUSE ON A TREE.

ABOUT sixty miles from the mouth of the Escondido is situated one of the most curious habitations in the world. It is a house built on the top of an enormous lignum vitæ tree. It is the home of Captain Henry Wildersen, a former Louisiana planter, who selected this remote and isolated habitation as his home several years ago. The tree is nearly six feet in diameter, and grows on a bluff overlooking the Rama River, a branch of the Escondido. At about fifty feet from the ground a platform about thirty feet square has been built, supported by diagonal braces, and this serves as the foundation of a rather pretty cottage painted white, with green shutters, and boasting a veranda in front and an observatory above the roof. The diagonal braces are boxed in, and in the inverted pyramid thus formed is the kitchen and storerooms. The upper story is nicely furnished. Access from the ground is gained by means of an elevator resembling a "dumb-waiter," so balanced that a person can easily raise himself by pulling on a rope.—*Phidelphia Ledger.*

A RAPID UNDERGROUND TRANSIT.

MESSRS. Walker & Kimball, of Boston, have made a valuable suggestion for a rapid-transit sub-way for that city. They have, perhaps first among those who have treated the subject, fully adopted the system of underground travel, and propose to excavate the whole width of Tremont street, covering the excavation with concrete vaulting, decorated on the underside with white glazed tiles. In the middle of the space would be two tracts for express trains, sunk below the general level, and the tracts for accomodation trains would run on each side, while a wide platform would occupy the space between the accommodation tracts and the fronts of the buildings on each side, the basements of the stores being fitted up for retail trade, and opening on the platforms, these constituting a continuous sidewalk. The scheme resembles that of the Arcade Company for a Broadway road, but with several improvements, both in construction and arrangement. Messrs. Walker & Kimball provide access to their express tracts by tunnels under the accommodation tracts, and stairways up to the stations, bridges being thrown across the express tracts, to provide communication between the upward and downward accommodation tracts. Of course, the whole structure would be brilliantly lighted by electricity, and those who have seen a modern first-class underground establishment, such, for instance, as the Subterranean Cafe in the Equitable Building in New York, will not need to be told how attractive it may be made.—*American Architect and Building News.*

BUSINESS MOSAICS.

—**Architects** should not forget to specify the "Josson" and "North" brands of Portland Cements in their specifications for brick or concrete work. Every barrel guaranteed by the importers of it, Grace & Co., 203 California street.

Dissensions and bickering may occasionally occur within the Board of Lady Managers, though individually they are agreeable to a man.—*World's Fair Puck.*

Contractors will do well to call on the Pacific Coast Door Co. of 808 Bryant street near Fifth, for estimates for doors, windows and blinds. They also give particular attention to estimates on special work of all kinds. Do not forget them.

Husband—I think I shall go out and catch a few fish for our dinner to-morrow.

WIFE—No, Edwin, we must economize. Buy them of the regular dealer.—*Detroit Tribune.*

For flats there is nothing handier for the opening and closing of the front door than the Rischmuller Door Opener and Closer. Price $15.00. All orders promptly attended to by Geo. Rischmuller, 934B Capp street this city.

When in need of Artistic Metal Work go to the San Francisco Novelty and Plating Works, corner of First and Mission streets, who make a specialty of this branch of their business, also gas and electric fixtures at manufacturers' prices. Gold, Silver and Nickel Plating of every description.

"Your picture of Columbus is anachronistic. You represent him as smoking when tobacco was not used."

"That's all right. He's smoking a cigarette.—*Detroit Free Press.*

We take pleasure in calling the attentions of Architects and Engineers to the very latest Patent Combination Architects' Level and Transit. This instrument is not only a great improvement over many now in use but also appears to be all that is required. It is made in the most substantial manner and a credit to the manufacturers, Messrs. Keuffel & Esser Company, for whom H. S. Crocker Co., 215-217-219 Bush street, are the agents.

The breaking weight of one foot of cast iron one inch square is 5781 pounds; the breaking weight of a piece of hickory of the same dimensions is 270 pounds.

We call attention to an advertisement in this paper of Mr. Albert Hansen, successor to M. & A. Hanson, who retired after a business career of seventeen years. The Pacific Planing Mill, Berry street near Sixth, is too well known in this vicinity to need any commendation from us, and we trust Mr. Albert Hanson will find plenty of new friends to add to the number of those of the old firm.

"**Miss** BLEECKER (describing a fire)—"The building was completely gutted."

MISS EMERSON (of Boston)—"Yes, thoroughly entrailed."

Every building of any importance needs a fire hose reel for its protection. The Chapman Improved Fire Hose Reel is conceded to be one of the most simple, practical and efficient apparatus of its kind, and many a large building has been saved from destruction by the foresight of its owner in placing one or more of these reels in a building. Every machine is guaranteed by the maker, R. S. Chapman, 14 and 16 Front street.

One of the lost arts is the manufacture of malleable glass.

There is nothing so convincing as facts that are proved by experience. At the paper mills East Walpole, Mass., where "Neponset" is made, the red rope fabric can be seen in liberal use, testifying the confidence of the makers in their product, and exemplifying the ability of the fabric to demonstrate its own value. Not only is this fabric used in the protected methods recommended in architects' specifications, but without even the protection of a coat of paint it can be seen where it has been for years doing duty in the place of clapboards and shingles, exposed to the elements on the outsides of buildings used as storehouses and offices, with perfect security to the merchandise and furniture, and entire comfort to the occupants within.

Dimmick & Low, 221 Front street, are the agents for this city where information will be cheerfully given of the merits of this favorite brand of water proof papers.

The door of the studio was flung open and she dashed wildly into the room, and seizing the unlucky photographer by his few remaining locks, shouted wildly: "How dare you, sir! How dare you insult me!"

"Insult you, madam? I am sure I —— ——"

"What is the meaning of that then, sir?" and she pointed to the notice on the back of the mount, "The original of this is carefully prepared."

It took him three weary hours to explain, and she left him a sadder and a wiser man.—*Photographic Times.*

Linerusta Walton is being extensively used at the present time in flats for wainscoting and gives to a room a most pleasing effect. For the latest designs go to M. M. Heineman & Co., No. 32½ Fremont street.

Mr. MCSWAT—"Have you packed you trunk yet, Lobelia?"

MRS. MCSWAT—"Not yet."

MR. MCSWAT (looking at his watch)—"Then you havn't any time to lose, the train leaves in exactly thirty-six hours." *Chicago Tribune.*

D. E. Condon, M. E., C. E., A. M. Inst. C. E., Consulting Engineer, 122 Geary street, room 1. Specialties: Accurate Calculations of Stresses and Strains; Safe Strength and Stability of all Structures in Iron, Steel, Masonry and Wood. See advertisement on prge xxii.

CITY BUILDING NEWS.

Army near Church. Additions to buildings; owner, Margaret Walsh; contractor, Jas. E. Schulz; signed, July 5; filed, July 6; cost $1,333.

Bartlett Nos. 117 and 119. Two-story frame, four flats; owner, J. W. Popper; contractor, M. Linn; signed, July 8; filed, July 11; cost $10,000.

Belvedere near Frederick. Frame building; owner, Amelia C. Rodrigues; architects, Pissis & Moore; contractor, Wm. Knowles; signed, July 24; filed, July 26; cost $2,025.

Broadway near Buchanan. Alterations; owner, Lizzie J. Hemphill; architects, McDougall & Son; contractors, P. J. & M. Brennan; signed, Aug. 8; filed, Aug. 9; cost $4,910.

Broadway and Mason. To build; owner, Catherine Mayer; architects, John & Balczynski; contractor, Peter Johnson; signed, July 18; filed, July 20; cost $3,150.

Broadway between Octavia ann Laguna. Addition to 2-story and basement; owner, James G. Burnett; architects, Piercy & Hamilton; contractors, C. A. Hooper & Co.; signed, July 27; filed, July 28; cost $1,175.

Bryant near 26th. Cottage; owner, Josephine A. Wardwell; contractor, W. W. Rednall; signed, July 26; filed, July 26; cost $1,800.

Capp street. Alterations and additions; owner, Mrs. Annie Smith; contractor, Geo. L. Marshall; signed, July 13; filed, July 15; cost $985.

California near Jones. Cement work; owner, Geo. Whittell; architects, Coxhead & Coxhead; contractors, Chatain & Gillett; signed, Aug. 3; filed, Aug. 5; cost $4,450.

California near Webb. Steam heating and ventilation; owner, S. F. Savings Union; architect, Wm. Curlett; contractors, A. Bannisteiger & Co.; signed, July 23; filed, Aug. 2; cost $5,285.

Carl and Stanyan. To build; owner, H. Johnson; architect, J. B. Wuersching; contractor, L. F. Fletcher; signed, July 5; filed, July 5; cost $1,800.

Central Ave. near Washington. To build; owner, E. B. Spaulding; architect, Wm. Curlett; contractor, Jos. Norris; signed, June 28; filed, July 1; cost, $8,425.

Chestnut near Mason. Two-story frame; owner, Wm. Beckman; contractor, A. Guilbert; signed, July 12; filed, July 26; cost $3,490.

City Hall Ave. Granite work for statuary; owner, Lick Estate; architect, F. Happersberger; contractors, Rocklin Granite Co.; signed, July 11; filed, July 17; cost $17,025.

Clay near Broadway. All work to build; owner, W. S. Rainey; architect, T. J. Welsh; contractor, H. Jacks; signed, July 14; filed, July 17; cost $1,910.

Clement near Ninth. To build; owner, Henry Verleger; contractor, Peter Johnson; signed July 11; filed, July 18; cost $1,580.

Dupont near Clay. To build; owner, Susan Crooks; architect, Chas. I. Havens; contractor, Jno. Furness; signed, July 6; filed, July 11; cost $10,869.

Eighteenth near Sanches. Two-story frame; owner, J. H. Lawson; contractor, Jas. Gabriel; signed, July 5; filed, July 6; cost $3,200.

Ellis near Mason. Hydraulic elevator; owners, Y. M. C. A.; architect, A. Page Brown; contractor, John Hammond; signed, July 18; filed, July 18; cost $4,650.

Fairmont near Palmer. A cottage; owner, Catherine Shepston; contractor, J. L. McLaughlin; signed, June 28; filed, June 29; cost $1,100.

Fell near Laguna. Carpenter work, brick work and painting, etc.; owner, Mrs. Annie Haynes; architect, J. J. Clark; contractor, Jonn G. Adams; signed, July 25; filed, Aug. 1; cost $5,700.

Fell near Lyons. All excavating; brick work, lathing, plastering, plumbing, etc.; owner, A. B. Spreckles; architect, Chas. I. Haven; contractor, Peter Crichton; signed, July 24; filed, July 27; cost $13,400.

Fell near Steiner. Grading and building; owner, Wm. Arthur Martin; architect, W. H. Lillie; contractor, C. P. Moore; signed, July 20; filed, July 28; cost $4,425.

Filbert and Leavenworth. Three-story frame; owners, A. Giusti and wife; architect, J. H. Littlefield; contractor, H. P. Hurlbut; signed, July 15; filed, July 18; cost $13,462.

Fillmore near Felton. All work to build except brick work, plumbing and painting; owner, D. B. Faktor; architects, Martens & Coffey; contractor, I. Bucher; signed, July 24; filed, Aug. 1; cost $4,819.

Fillmore near Fulton. Ex. and brickwork; owner, D. F. Faktor; architects, Martens & Coffey; contractor, J. O. Sullivan; signed, July 29; filed; Aug. 1; cost $784.

Fillmore near Fulton. Carpenter, mill and stairwork; owner, A. Jungblut; architects, Martens & Coffey; contractor, J. Bucher; signed, July 24; filed, Aug. 1; cost $4,787.

Fillmore near Fulton. Excavatings and brickwork; owner, A. Jungblut; architects, Martens & Coffey; contractor, J. O. Sullivan; signed, July 29; filed, Aug. 2; cost $784.50.

Fourth street. To build; owner, Ed. Laeffler; contractor, Jos. Gabriel; signed, July 18; filed, July 20; cost $1,600.

Franklin near Pine. Two-story frame; owner, Chas. Schmitt; architects, Henriksen & Mahoney; contractor, James McLean; signed, July 25; filed, July 26; cost $8,500.

Franklin and Pacific. Alterations; owner, Henry Meyer; architect, J. E. Krafft; contractor, Geo. R. Lang; signed, June 19; filed, June 30; cost $1,482.

Francisco near Powell. Excavation, concrete and brick; owner, J. Schweitzer; architect, H. Geilfuss; contractor, J. O. Sullivan; signed, June 30; filed, July 5; cost $4,324.

Francisco near Powell. Two-story frame, 26 flats; owner, J. Schweitzer; architect, H. Geilfuss; contractor, A. Guilbert; signed, July 18; filed, July 21; cost $16,500.

Francisco near Powell. Plumbing two-story frame; owner, J. Schweitzer; architect, H. Geilfuss; contractor, W. J. Weeks; signed, July 18; filed, July 21; cost $2,105.

Francisco near Powell. Plastering two-story frame; owner, J. Schweitzer; architect, H. Geilfuss; contractor, Arthur O'Brien; cost $2,697.

Francisco near Powell. Painting two-story frame; owner, J. Schweitzer; architect, H. Geilfuss; contractors, J. Quadt & Co.; signed, July 18; filed, July 21; cost $1,925.

Golden Gate Ave. near Devisadero. Carpenter work, etc.; owner, John J. McElroy; architect, M. J. Welsh; contractor, Henry Rohling; signed, July 27; filed, Aug. 5; cost $4,700.

Golden Gate Ave. near Larkin. Additions; owner, Mrs. Eliza Magnes; architect, J. F. Kenna; contractors, Currie & Loomer; signed, July 28; filed, July 29; cost $1,450.

Green near Scott. Grading; owner, Martin O'Connell; contractor, Julian E. Carey; signed, July 24; filed, July 25; cost $485.

Hayes near Webster. Alterations and additions; owners, T. & C. Molloy; architect, C. J. I. Devlin; contractor, Daniel Powers; signed, July 5; filed, July 7; cost $1,451.

Hyde and California. Plumbing and gas-fitting; owner, F. Katy; architect, A. C. Laugens; contractor, Wm. F. Wilson; signed, July 29; filed, July 31; cost $1,587.

Hyde near California. Carpenter and plastering; owner, Fred Katz; architect, A. C. Laugens; contractor, F. V. Steinman; signed, July 1; filed, July 5; cost $12,000.

Jackson and Scott. To build; owner, Wm. H. Talbot; architect, Clinton Day; contractor, Peter Crichton; signed, Aug. 7; filed, Aug. 9; cost $38,000.

J. near 8th Ave. All work to build; owner, Mary Freel; architect, M. J. Welsh; contractor, James McConahey; signed, July 20; filed, July 25; cost $1,500.

Jones and Filbert. Alterations and additions; owner, Chas. O. Rether; contractor, Geo. Weismann; cost $3,875.

Jones near Chestnut. Two-story frames; owner, J. F. Witzel; architect, W. Winterhalter; contractors, Saywell & Mackenzie; signed, July 12; filed, July 13; cost $2,765.

Lombard near Jones. Three-story frame; owner, Kate Johl; architect, R. H. White; contractor, Jas. Campbell; signed, July 19; filed, July 21; cost $5,080.

Marine Hospital. Additions; owner, United States; contractors, McCann & McKay; cost $2,240.

Market near Church. Two-story and basement; owner, Godfrey Smith; contractors, Patterson & Person; signed, July 31; filed, July 31; cost $3,685.

Mason near Eddy. Tinning and iron work; owner, S. Silverberg; architects, Salfield & Kohlberg; contractor, Jos. F. Forderer; signed, Aug. 4; filed, Aug. 9; cost $1,125.

Mason near Eddy. Elevator work; owner, S. Silverberg; architects, Salfield & Kolberg; contractor, Wm. H. Birch; signed, July 18; filed, Aug. 9; cost $3,710.

Mason and Vallejo. Alterations; owners, Francesco Pagano & Cono Sabatino; contractor, Emanel T. Picapo; signed, July 27; filed, July 31; cost $1,300.

Minna between 6th and 7th. Alterations and additions; owner, Mrs. M. Connell; contractor, T. R. Bassett; signed, July 27; filed, July 28; cost $1,400.

Minna near 3d. Three-story brick building; owner, Jean Rieu; architect, E. Depierre; contractors, Ewell & Barton; signed, July 8; filed, July 10; cost $3,925.

Mission Road. All work to build; owner, Jas. Comosky; architect, Ed. J Vogel; contractor, J. F. Mullerick; signed, June 28; filed, June 29; cost $2,250.

Mission near 5th. An elevator; owner, Emma Lolor; architect, Chas. Geddes contractors, W. H. Birch & Co.; signed, June 27; filed, July 1; cost $1,755.

Natoma near 8th. Three-story frame; owner, Jno. Hurley; contractor, Allen MacDonald; signed, July 6; filed, July 7; cost $2,280.

Ninth and Clementina. Carpenter work; owner, E. J. Fotheringham; architect, J. E. Krafft; contractor, C. P. Moore; signed, July 12; filed, July 19; cost $8,700.

Ninth and Clementina. Plumbing; owner, E. J. Fotheringham; architect, J. E. Krafft; contractor, H. Williamson; signed, July 12; filed, July 19; cost $1,150.

Ninth and Clementina. Brick and stone work; owner, E. J. Fotheringham architect, J. E. Krafft; contractor, R. Ringose; signed, July 12; filed, July 19 cost $1,369.

O'Farrell and Bagley Place. Gas fitting, etc.; owner, Benj. Curtaz; architects John & Balczynski; contractor, Wm. F. Wilson; signed, July 29; filed, Aug 5; cost $5,735.

O'Farrell near Franklin. To build; owner, Richard Bunton; architects, Shea & Shea; contractor, Duncan G. Chisholm; signed, July 24; filed, July 26; cost $5,672.

O'Farrell and Bagley Place. Plastering on six-story brick: owner, Benjamin Curtaz; architects, John & Balczynski; contractor, Chas. Dunlop; signed, July 11; filed, July 13; cost $3,475.

O'Farrell and Bagley Place. Carpenter work on six-story brick; owner, Benj. Curtaz; architects, John & Balczynski; contractor, Adam Miller; signed, July 3 filed, July 3; cost $27,500.

O'Farrell near Franklin. Excavating and brick work; owner, Richard Bunton; architects, Shea & Shea; contractors, M. Fennell & Son; signed, July 8; filed, July 11; cost $2,119.

Pacific near Sansome; To build; owner, Antonio Chichiz; architect, Chas. I. Havens; contractor, John G. Adams; signed, July 28; filed, Aug. 2; cost $14,450.

Pine and Broadway. Moving, building and repairs; owner, Lizzie I. Hemphill; architects, McDougall & Son; contractor, Geo. Davis; signed, July 15; filed, July 17; cost $1,700.

Post near Lyon. Alterations and additions; owner, G. S. Olsen; contractor, G. G. Gillespie; signed, July 10; filed, July 11; cost $2,900.

Rich and Harrison. Alterations; owner, E. B. Vreeland; architects, Townsend & Wyneken; cost $6,000.

Santa Clara near Florida. All work to build; owner, Jno. Hannavan; contractor, F. M. Schweizer; signed, June 29; filed, June 29; cost $2,280.

San Jose Road near Onondago Ave. Two-story frame; owner, David Ferullo; architect, Chas. M. Rousseau; contractor, Louis Cereghino; signed, July 24; filed, July 25; cost $2,554.

Sanchez and 14th. Three-story frame; owner, Charles F. Selk; architects, Martens & Coffey; contractors, Schutt & Krecker; signed, Aug. 3; filed, Aug. 4; cost $4,535.

Second street. A salt water intake; owner, Edison L. & P. Co.; architect, T. H. MacDonald; contractors, Healy, Tibbetts & Co.; signed, July 7; filed, July 19; cost $7,500.

Stockton street 119. Building brick house; owner, Stefano Arata; architect, H. Pauls; contractor, J. F. Hills; signed, Aug. 9; filed, Aug. 9; cost $1,675.

Turk near Scott. Two-story frame; owner, Jeremiah Manning; contractor, J. J. Manseau; signed, July 18; filed, July 18; cost $3,600.

Turk and Larkin. Painting; architects, Coxhead & Coxhead; contractor, James W. Reinfield; signed, Aug. 4; filed, Aug. 8; cost $1,007.

Twentieth near Valencia. Two bakers ovens; owners, Frank & Bregetta Laub; architects, Martens & Coffey; contractor, Chas. C. Krelling; signed, July 27; filed, Aug. 2; cost $1,100.

Twentieth near Valencia. Carpenter, mill and stair work, painting and plumbing; owners, Frank and Brigitta Laub; architects, Martens & Coffee; contractor, F. Weirochi; signed, July 24; filed, July 27; cost $6,200.

Twenty-third near Eureka. To build; owner, John Conly; architect, Wm. Mooser; contractor, Wm. Helbing; signed, July 17; filed Aug. 3; cost $3,000.

Twenty-fourth and Mission. Three-story frame; owner, Mrs. Geo. Sweetser; architect, S. Hatfield; contractor, Allen McDonald; signed, July 11; filed, July 15; cost $3,280.

Twenty-fifth street 1413. Alterations and additions; owner, Louis Finberg; contractor, H. R. Schmuckert; signed, July 29; filed, Aug. 3; cost $779.

Twenty-sixth and Mission. Artificial stone work; owner, Emma L. S. Mangels; architect, H. Geilfuss; contractors, Cump & Curillon; signed, July 6; filed, July 7; cost $1,199.

Vallejo near Kearny. Alterations and additions; owner, Thos. Poggie; architect, E. Depierre; contractor, John Dyar; signed, June 28; filed, June 30; cost $540.

Waller and Belvedere. Plastering five houses; owners, Cook, Smith & Hinkle; architect, Ed. Burns; contractor, Andrew Flood; signed, July 14; filed, July 14; cost $1,413.

Waller near Fulton. All work to build; owner, National Bottling Co.; architects, John & Balczynski; contractor, Chas. Hippely; signed, July 19; filed, July 21; cost $3,025.

Waller near Devisadero. Alterations; owner, W. W. Grissim; contractor, John L. Larenzen; signed, July 20; filed, July 21, cost $2,225.

Washington near Franklin. To build; owner, A. G. Booth; architects, Smith & Freeman; contractor, L. H. Kent; signed, June 27; filed, June 30; cost $4,275.

ALAMEDA COUNTY.

Alice and 3d, Oakland. Alterations; owner, Mary A. Surryhue; contractor, Chas. Riedel; signed, July 10; filed, July 11; cost $1,585.

Bartlett Tract, Alameda. To build; owner, I. L. Van Brunt; contractors, A. W. Pattianni & Co.; signed, July 29; filed, July 31; cost $2,360.

Bray Ave. near 19th street, Fruitvale. To build; owner, Seraphie Lampe; architect, Brother Adrison; contractor, T. R. Bapett; signed, July 12; filed, July 14; cost $12,942.

Filbert and 32d, Oakland. Cottage; owner, Mrs. F. Jacobs; contractor, P. J. Brophy; signed, Aug. 3; filed, Aug. 3; cost $1,436.

Ninth and Jackson, Oakland. To build; owner, Rufus Smith; architect, J. Conant; contractors, Cadwell & Nickerson; signed, July 10; filed, July 11; cost $4,023.

North addition to Brooklyn, lot 42 and 53, block 67. To build; owner, C. B. Foote, architect, J. Conant; contractor, A. W. Cornelius; signed, July 7; filed, July 10; cost $3,057.

Paru near Clinton Ave., Alameda. To build; owner, P. B. Ladd; contractors, R. & W. H. Weeks; signed, July 12; filed, July 14; cost $2,718.

Taylor Ave. and McPherson street, Alameda. To build; owner, Eliz. Rodenbeck; architect, C. S. Shanner; contractor, T. F. Fennell; signed, June 7; filed, July 11; cost $1,760.

Villa Lots, Berkeley. Two-story frame; owner, N. L. Freese; contractor, J. W. Budenbecker; signed, July 10; filed, July 11; cost $2,460.

The California Architect and Building News.

Copyrighted 1893, by the California Architectural Publishing Company.

OFFICE, 408 CALIFORNIA STREET, SAN FRANCISCO, CAL., U. S. A.

VOLUME XIV. SEPTEMBER 20th, 1893. NUMBER 9.

A MONTHLY JOURNAL DEVOTED TO THE ARCHITECTURAL INTERESTS OF THE PACIFIC COAST.

Published on or about the 20th of each month by The California Architectural Publishing Company. The Stockholders being Architects and others interested in the profession.

SUBSCRIPTION TO THE JOURNAL, - $3.00 PER YEAR IN ADVANCE.

MR. H. T. BESTOR, one of our most experienced architects is now on his way to visit the World's Fair along with the Veteran Firemen's Association. Mr. Bestor is one of the directors of the CALIFORNIA ARCHITECT AND BUILDING NEWS and has been such since its incorporation four years ago. We wish him *bon voyage* and a safe return.

WE regret to see that no steps are being taken to start work on the new Post Office that San Francisco has so long needed. It is too bad that political influence should hinder the well being and progress of this city. The Post Office is needed and needed badly; the work it will make for idle mechanics is also needed badly, and there exists no valid reason why the two needs should not be satisfied.

If the citizens of this city had enough public spirit to act and act vigorously, when occasion required, and did so, there would not be half so much complaint about hard times. Now is the time to make an energetic protest for this public improvement. Let us knock for recognition; if that hint is not enough, let us kick for it, and kick hard enough to be heard.

WHE Board of City Hall Commissioners have re-considered their action in adopting the design of an Octagon tower for the New City Hall, and have accepted a design prepared by their architect, Mr. Frank Shea, which if executed according to the present intention of the Board, will crown the building with a circular dome; as soon as the drawings are finally completed, we will, with the architect's kind permission, publish such of them as will give a clear idea of the solution now arrived at.

In the mean time we publish in another column the report on the vexed and much discussed problem, that was prepared several years ago by the San Francisco Chapter of the American Institute of Architects, at the request of the Commissioners who had charge of the works at that time.

The present state of affairs substantially justifies the conclusions that were reached by the chapter, after a most careful and painstaking study of the problem, and after lapse of

many years and the rejection of many designs, the recommendations that the chapter made have been followed, and we think the public will, when they have the opportunity of judging the completed structure, be satisfied with the decision reached.

In this regard we desire to call the attention of the Commissioners to a suggestion made by Mr. Pissis, one of the committee who prepared the report in question, who pointed out the value of a model, constructed to scale, of the existing portions of the building on which could be illustrated in miniature the effect of any subsequent proposed modification or additions to the buildings, giving opportunities to judge of the effects that would be produced from the various points of view, and enabling a more correct judgment of these effects to be had than could be obtained from any number of perspective drawings, however carefully executed.

Such a model would prove invaluable in case the question of completing the buildings with the mansard roof, shown in architect Laver's original design, should ever be seriously brought up. To satisfactorily solve this question of a mansard roof, will require quite as much study as has been expended on the problem of designing a suitable tower.

WE present our readers this month with the accepted designs for the five principal buildings that will house the California Midwinter International Exposition, to be held in San Francisco, California this coming winter—as well as some that received the second prize.

The idea of having such an institution in the winter season is a novel one, and one of the main purposes of the originators of the project, is to show the world at large that we possess a climate that will admit of such an innovation upon accepted precedents.

The managers of the Exposition have adopted a set of designs that will do us credit, and our architects have shown that they are fully able to meet such an emergency as that requiring the hasty production, on short notice, of creditable sets of plans for a style of buildings with requirements differing entirely from the customary routine of an architects' duties.

The contracts for the two largest buildings have been awarded and work on them will be begun this month.

On the first of next January the Exposition will be opened to the public and California will show what she can do on short notice.

ARCHITECTS AND THEIR SPECIFICATIONS FOR ELECTRIC LIGHT WIRING.

NAT. B. ALLEN.

THE little importance which Architects attach to the wiring of their buildings for electric lighting, and the loosely gotten up specifications for this class of work, is a matter of regret to every electrical contractor who desires to see the standard of wiring raised to where it should be—as near an ideal system as is possible.

The Pacific Insurance Union, have issued rules which regulate the manner in which work shall be done, also the kind of material to be used, so it is not necessary for the Architect to go into these details, all contractors know that "switches and cut-outs must be double-poled and have incombustable bases," they know that the work must be done according to these rules in order to secure the certificate of inspection from the Pacific Insurance Union; yet the general run of specifications are made up of these details, and no attention is paid to what is of paramount importance, and without which, no reliable estimate can be made, that is, an accurate set of plans showing the location of each cut-out cabinet, the circuits running from these to the lamp terminals, the length of each circuit, the *size* of wire, location of switch out-lets, and the number of lamps to each out-let.

The loss of potential should be figured out in such a manner that the most economical results, in the working of the system may be obtained; this can only be done by one who has, both a theoretical and practical knowledge, of what is required in each individual case. It is impossible to make one set of specifications fit all buildings, as the distribution of losses is entirely different in buildings used for different purposes, a difference of fifty feet in the position of the centre of distribution may entirely alter the location of risers, and may entirely change the cost of the installation several hundred dollars.

Another point of importance which is almost invariably overlooked is the leaving of chases in the walls of brick buildings to carry the wires for floor distribution and for mains; the location of such chases should be carefully considered with reference to lateral openings. Architects leave chases for the plumber and gas-fitter, why not for the electrican? They could be left at a small expense while the walls were being built, but if the contractor has to devote days to drilling brick or stone walls, it necessarily adds considerable to the wiring contractor's bid.

Of no less importance is the position of all out-lets and the number of lights per out-let, since this determines the number of circuits, the length and sizes of tap lines, the method of running the circuits, the number of cut-outs, and the amount of labor involved.

From the foregoing it will be seen that the Architect should make ample provision for the wiring of buildings; we do not think that Architects, as a rule, are sufficiently educated in electrical matters to be able to understandingly make a set of specifications for this class of work and see that they are complied with, he should, therefore, employ some successful engineer to attend to the electrical part of the buildings, this will be much more satisfactory to the electrical contractor, being assured that intelligent provision has been made for his work, he can afford to charge much less for same.

THE SLATE INDUSTRY OF CALIFORNIA.

THE fact that there is a growing demand on the Pacific Coast for Slate Roofing cannot be questioned. In view of this, it is but fair that our journal, published in the interest of the building industry, as well as all materials used in the construction of buildings should at this time present a few facts concerning a material which in the Eastern States as well as Europe is used almost exclusively for covering roofs. Our earliest building on this coast was of such a temporary character that no thought was given to how long the roof covering would last. The cheapest (first cost) most convenient material at hand, would be selected and on it went. In a year or two if the roof leaked on went another, or the old one was patched up to try and outlive another winter. In a few years the roof had cost twice as much as would have covered it, in the first instance, with a material that nature has given us and which will not wear out for many years. Yet to bring slate from the east meant a very expensive roof, and only a few could afford to use the material. Not so to-day for the opening of the Slate Quarries of El Dorado County in this State, has put the material within the reach of everyone. Again we have entered a new era in the building line. Our architects are being called upon to design structures composed of steel, iron, brick, terra-cotta and stone; and such as will compare with any buildings in the world. This is what is causing a demand for slate. Our architects, if allowed, will have a material on the roof that will be in keeping with the rest of the building. The earliest use of slate for covering roofs (of which we have any record) was in the twelfth century. The Old Castle of North Wales at Carnarvon and Conway, were covered with slate. Also the Castle at Augers, France, built in the vicinity of the slate beds that are now being largely quarried under-ground. When Edward I. visited the copper mines o Drwysyeold in North Wales, he stayed at a house in Nantlle, roofed with slate. On the mountain slopes of North Wales on several of the slate ranges are traces of old workers, and the tracks along which they carried the slate on their own backs, or the backs of their horses, are still discernable and form part of many a mountain path. In an Ode written by a Welsh poet in the year 1570, we find the first mention of the Penrhyn quarries. The Bard Sion Tudor asked the Dean of Bangor for a load of slate form the Caehier quarry. The Aberllefeni quarry is as ancient, for an old timbered house is said to have been covered with slates from the quarry in the days of Queen Elizabeth. About the same time the slates from the De la Bole quarries in Cornwall had attained considerable repute. Carew writing in 1602 describes them as, "in substance thimee, in color faire, in waight light, in lasting strong, and generally carrieth so good regard as (besides the supply for home) great store is yearly conveyed by shipping both to other parts of this realm, and also beyond the sea into Britaine and "Netherlands." Speaking of the same quarry in 1758, Borlaise writes that for its lightness and enduring of weather it is generally preferred to any slates in Great Britain. He describes the great quarry as in his time 300 yards long, 100 yards wide, 80 yards deep. It is evident from the size of the quarry that a considerable quantity of slates had at that date been extracted from it.

The growth of the slate trade in Europe within the last twenty-five years has been something enormous, and may be spoken of as one of great prosperity. Limited only by the ability to supply the demand. Merchants there are ready to contract for the whole out-put of good quarries. Aside from this during the year 1892, New York alone exported to the British Isles 2,122,065 roofing slates; notwithstanding the great number of quarries in operation in Wales and the thousands of men employed in the production.

In the United States we have the following states which are producers of slate: Main, Vermont, New York, Ohio, Georgia, Pennsylvania and California. It would take up too great a space to go into details and treat the vast business done in these different states in roofing slate alone. We will however note two as an example. Our Vermont company last year produced 20,152,719 squares and their shipments amounted to 10,299,724 squares. Another company in Pennsylvania shipped from their quarry from eleven to sixteen car loads daily, twenty tons each equal to sixty squares of slate to the car. During the year 1892 the total tonage shipped from the counties of Lehigh and Northampton amounted to 172,000 tons of roofing slate, a little less than 9,000 car loads of twenty tons each.

Until a few years ago all the slate used on the Pacific Coast come from the east, to-day the county of El Dorado supplies most of the slate used here (at least in California). In our issue of two months ago we described the quarries of this county which seems to be the only deposit in this state that could be used for roofing; where there is deposits o what is called slate in other counties it is not such as could be used for roofing. The material for this purpose must have good cleveage qualities, or rather be such as will allow of its being split into sheets, however it is not the process we wish to deal with, sufficient it is to say that California produces a slate of such quality and color as will compare with any produced in the world, and the same can be bought for one-half the cost of eastern slate landed here. The fancy colored slate is fast going out of use, the demand being for black slates, and rightly so, for nothing can be more handsomer than a plain black roof, particularly for our modern style of architecture.

A roof strong enough for shingles will hold slate. It is fire-proof, and when laid properly the elements have no apparent effect. It will not absorb water, nor hold snow. There is many instances where slate has been taken from a building on which it has been for seventy-five to a hundred years and re-laid on another.

Assuming the life of the various kinds of roofing to be as described in the following table, it will be seen that while the first cost of slate is somewhat greater than other materials, it has a very great advantage at the out come:

Material	Original Cost per Square or 10 x 10 feet	Life	Average Cost per Annum
Slate	$10.50 to $11.00	100 years	10 5-100 or 10 10-100 cents
Tin	8.50 " 9.00	15 "	56 2-3 or more "
Corrugated Iron	8.00 " 8.50	10 "	80 " " "
Shingles	4.00 " 5.00	12 "	33 1-3 " " "
Boards	2.00 " 2.50	8 "	25 " " "

In above estimates we have made no allowance for painting of the tin, iron or shingles, if these materials are not painted regularly and well, they will not last the time given.

To the owner or landlord no portion of a building is so great an expense to keep in repair as the roof, nor so great an annoyance to a tenant as a leaky one. Slate is always sold by the square which is 10x10 feet or 100 superficial feet. Let us have more slate roofs on this coast and the result will be that we shall have fewer fires, cooler houses in summer, warmer in winter, and last but not least, less expense for repairs.

ARE CALIFORNIA HOMES AS HEALTHFUL AS THEY SHOULD BE?

BY MARSDEN MANSON, C. E.; Ph. D., MEM. TECH. SOC.

[Read May 19, 1893.]

THIS question must be answered in the negative, for the prevalence of filth diseases* in city, village and country homes in California, in the presence of natural conditions which are a guarantee of the purest health, forces the conclusion that we are not maintaining the healthful conditions which naturally exist. There is, therefore, every justification for a rigid inquiry into the causes which produce and propagate filth diseases, and the use of plain words in laying

*The writer prefers the term *filth disease* to the more frequently used term *zymotic disease*. The former more plainly expresses the true cause of much sickness, which, when fully appreciated, suggests the proper remedy—cleanliness.

the facts bare. The threatened visitation of that most frightful of all filth diseases, Asiatic cholera, further accentuates the propriety of bringing up the subject of cleanliness—not only as to person—but in the broader and equally important application to water, food, air and surroundings.

The causes and conditions which propagate many filth diseases have been considered so subtle that an investigation of them is ofttimes regarded as super-technical and impracticable until too late, when their track is plainly marked in the health reports and death list. The simple and rigorous methods of analysis which microbiology brings to the aid of chemistry, makes the detection of the cause and course of filth diseases absolutely certain.

The particular microorganisms which produce certain of these diseases are as well known as are the symptoms; they are traced from patient to patient through the water, food, or clothing with a certainty, which if generally known, would make every intelligent human being an expert in sanitation. They are multiplied in favorable places and under favorable conditions with a degree of rapidity which would poison a continent in a few weeks with the developments of a single germ. It is therefore necessary to discuss these facts in plain words, and to bring them not only before the physician and the civil engineer, but to the very children in the school house. The complete following up of the study thus inaugurated involves one of the deepest problems of modern science, namely, how to treat small areas so as to permit them to be densely populated without impairing the natural healthfulness, and even to remove natural conditions inimical to healthful occupation.

All the sewers, all the water works, all the heating and ventilating contrivances ever built, have been attempts, more or less successful, to solve this great problem or to remove the fatal consequences of failing to provide proper sanitation at the outset. It therefore becomes necessary for municipal officers to employ the most honest means and the highest talent in planning and constructing every detail of municipal engineering, and to leave no part to the charge of either the ignorant or the grasping. Such large portions of the population of all cities are either ignorant or unmindful of their surroundings that special efforts must be made to force sanitation upon them; not only for themselves, but for the sake of those who are forced to partake of the consequences of witless or vicious self-neglect.

THE CONDITIONS IN THE COUNTRY.

The duties of the writer have called him to many parts of the State, and the natural conditions have been a matter of close observation and study for many years. It may be said that no filth disease naturally prevails in California, except chills and fever in certain low lands in the great valley, and in similar localities elsewhere. Yet in these localities the disease is easily escaped by avoiding the use of surface water. This fact was first brought to the writer's notice some fifteen years ago by Colonel Mendell of the Engineer Corps, of the U. S. A., and has since been closely followed up and observed in numerous localities.

In traveling through the great valley of California, the close observer is frequently struck with the entire absence of chills and fever in a particular locality of a district over which the disease is generally prevalent, the drainage and surroundings of the escaping locality being frequently worse than the infected neighborhood. The method of ascertaining the conditions is as instructive a way of explaining the facts as any other—After the usual salutations and inquiries as to weather and crops, the subjoined questions and answers follow—

"What kind of water have you?"

"Well water"

"Deep well?"

"No, not very, some twenty feet, struck a fair flow at sixteen feet."

"Is the water good?"

"Firstrate, soft water, washes easy so the women folks say."

"Any chills and fever?"

"Well, a little now and then towards fall, but we generally go up to the mountains or to the seashore for a time and get over them."

"What causes the chills?"

"Well the air draws in here from the tules and swamps and brings malaria."

Passing on for a mile or less the inquirer reaches a neighbor and asks the same questions of a sturdy citizen whose ruddy youngsters and buxom wife bespeak entire absence from chills. His replies as to water are about as follows—

"Our well is pretty deep, we didn't get much water at the first gravel and had to bore 190 feet (frequently three or four hundred feet) before we got water, but then got a good flow rising nearly to the surface."

"What kind of water?"

"Firstrate cool water, but a little hard and mineral like. The women folks have to use soda in washing."

"Any chills and fever?"

"No, not here, but down at neighbor Blank's they have a touch in the fall."

"Why do you escape?"

"Well the air draws in here from the plains and we don't get the miasma from the tules."

These questions the writer has asked dozens of times and found that where chills and fever prevailed, the wells are either shallow, or the surface water is permitted to drain in alongside the well casing and is pumped up with the deep water.*

In country homes, exposed tanks badly cleaned are another source of injurious contamination. Very frequent cases are found of milch cows and stock being watered from a shallow well surrounded by the accumulated filth and manure of years. The milk or flesh of such animals cannot possible be wholesome.

The City of Stockton affords a very marked example of the effect of the water supply upon chills and fever. In the early history of the city the water was obtained from wells, generally shallow. After the introduction of the water from deep wells, the disease began to disappear, and is now as rare as it was formerly prevalent. A study of the various strata is very instructive in this connection. At from forty to sixty feet a stratum of dense clay occurs, below which the water is drawn from very distant sources; at from fifteen hundred to twenty-six hundred feet the water is hot and charged with light carburetted hydrogen which largely forms the natural gas of the locality.

The disposition of garbage, manure and fæcal matter around country homes rarely receives that attention which health necessitates. The dangerous and fetid cesspool is almost universal. It could be easily replaced by the construction of a closet on a well shedded mound and the use of a little dry earth. With ordinary attention this simple expedient makes the surroundings entirely pure and inodorous. Some such simple method should be obligatory in isolated country school houses and hotels.

THE CONDITIONS IN VILLAGES.

The villages and small towns of California where there is a public water supply, are generally furnished from deep wells supplemented by the wells of individuals. These latter are classified as are country wells, and are subject to greater danger of surface contamination from cesspools and garbage heaps. The mountain towns and villages have generally a water supply of great purity. It is in the villages and small towns that the disposition of fæcal matter reaches its maximum point of danger to health and life. This fact is distinctly recorded in outbreaks of diphtheria, typhoid, and gastric fevers, and other filth diseases—which diseases could find no lodgment were the naturally healthful conditions maintained by the adoption of proper measures.

The most glaring case of contamination of this character which ever came under the writer's notice was as follows: Some five years since, in looking into the sanitary conditions of a valley town, one family in particular was reported as suffering from a series of filth diseases necessitating expen-

*See "Drinking Water as a Source of Malaria," the *Sanitarian*, August, 1892, Vol. XXIX, page 127.

sive doctor's and druggist's bills and frequent trips to the seashore. The head of the house had been very positive and strong in his condemnation of the healthfulness of the town, and was then absent and his home tenantless. The case was so aggravated that there was justification for a very thorough examination of the premises. The house-drainage was at first looked to. There were no waterclosets, tubs, nor basins, so that danger from this source did not exist. The kitchen sink, receiving all waste water and refuse matter from this source, drained into an open box very much clogged up and full of putrescent matter. This box passed within a few feet of the well casing and was broken so as to permit the drainage to pass to the well; within less than twenty feet of the well was a cesspool with the putrifying fæcal matter of years soaking through the soil in all directions.

The strong remarks of the owner as to the town were but feeble expressions compared with a proper condemnation of this individual case. Instructions were left to the effect that if pure water were not supplied, the household could dispense with the doctor and druggist and send for the undertaker. It is needless to state that as soon as the causes and actual conditions were pointed out the matter was promptly remedied. The city of Sacramento is particularly exposed to the pollution of the soil from cesspools. This danger is increased by the drainage of water-closets into the cess-pool, which practice is essentially more dangerous than the simple pit, although both should be avoided.

An illustration of the results of the want of care as to purity of water supply, is very strikingly illustrated in the case of Plymouth, Pa. This town has about eight thousand inhabitants. In the spring of 1885, nearly one person in every six was stricken with typhoid fever, more than ten per cent of the cases being fatal, the deaths being about 130. This outbreak was traced by Dr. Shakespeare to a single case occuring during the winter in the water-shed supplying part of the town. The dejecta of this patient were thrown out upon the snow and upon the occurrence of warm weather the germs found their way into the water supply with the above result. The melting of the snow occurred on the twenty-fifth of March; the disease broke out on the tenth of April, and was confined to that portion of the inhabitants using water from the infected source.* Medical and sanitary journals and reports are full of many similar cases.

In the hotels and public schools in the villages and smaller towns without proper sewerage systems the closets are generally of the most primitive kind, and foul to a nauseating degree. The simple measures suggested for country homes would make a marked difference in the health of those exposed to this source of disease. It must be remembered that where improper methods of disposing of human waste are practiced the ill effects are cumulative and are not eradicated in centuries.

Several of the large towns and cities are supplied with river water taken below sources of deadly contamination and only escape its consequences for a time and probably not to the extent that they imagine. In the event of the occurrence of filth diseases of a virulent type above these towns it is difficult to see how they can escape serious visitations of the disease. At this point it is proper to call attention to the illegality of discharging foul matter into the streams of this State and the lax administration of Section 374 of the Penal Code. It will thus be seen that there are too many instances of either ignorance or carelessness as to the water supply of homes, and it is the duty of every house holder to look carefully to this, the most ready course of filth disease into the system.

THE CONDITION IN THE CITY OF SAN FRANCISCO.

The water supply of San Francisco is obtained from several sources, the major portion coming from sources of undoubted excellence. There are two minor sources whose area by reason of growing population and neglect are rapidly becoming dangerous if not already so.

The catchment area of Mountain Lake and Lobos Creek, embracing some 1500 acres, all within the limits of the City and County, is fast gaining in those conditions which pollute both the surface and underground drainage. The most glaring of these conditions are:

1. The absence of any sewer system with proper outlet.
2. The existence within its area of a hospital connecting with a sewer without any outfall.
3. The existence of not over clear "dairies."
4. The use of part of the area for cemetery purposes.
5. The dumping of garbage and filth as filling for lots below grade.

The watershed tributary to Lake Merced, some 5,000 acres in extent, is objectionable from the same general causes, although less in degree and extent.

The area tributary to the present Alameda creek source will have to be abandoned in the future for the same cause. All areas from which a municipal water supply is drawn should be kept absolutely free from human habitation, and it would be a wise measure for municipalities in a growing country to acquire catchment areas and afforest them. In this way valuable forest reserves could be made for all time, and the area made as valuable for timber as ordinary farming lands, and by the proper section of the trees to be cut the area made a source of permanent timber supply.

The house tank, when not kept scrupulously clean, is a source of contamination even when pure water is supplied. When not absolutely necessary they should be dispensed with.

Water is the most active disease distributor imaginable, and to paraphrase the very truthful words of a celebrated authority—"No power upon earth could save San Francisco from the scourge of cholera or typhus were a single case to occur or a single infected garment to be washed in one of the watersheds supplying the city with water." The use of a water supply from areas partly within our city limits should be immediately prohibited.

In this connection it may be well to quote from the recent law of the State of New York,* which, in providing for the purity of the water supply of her chief city, conferred upon the Commissioner of Public Works powers possessed only by the most tyrannical governments. Yet these powers were wisely conferred and are being justly and wisely executed; for never can the power of law be more humanely and justly exercised than in the enforcement of those conditions which prevent the introduction and spread of filth diseases. In this remarkable law the Commissioner of Public Works was authorized to enter in upon the lands and homes of persons breaking the imperative laws of cleanliness, and even to burn up and eradicate every vestige of possible contamination. One million five hundred thousand dollars is made available in three equal sums for three years.† Such action is necessary in the face of the fact that during the years 1832, 1848, and 1866, cholera had entered that great mart and paralyzed every industry and brought death and sickness in its most frightful and disgusting forms to her homes.

In 1873, cholera devastated the southern and western portions of the United States, but it gained no foothold in New York by reason of the rigid quarantine measures and excellent control of the imported cases.

DISPOSITION OF GARBAGE AND WASTE.

The degree of carelessness and inattention reached in San Francisco to this important sanitary matter is unequaled in any part of the United States. In this city the matter has long passed the stage of official and criminal neglect, and reached that of civic indifference.

Many lots and streets in the northern part of the city have been filled up with highly putrescent matter which cannot be excavated for foundations, sewers, pipes, or conduits of any kind within the next few centuries without endangering human health and life. In the center of the city, and in a

*Page 3, Textbook of Medicine, Strumpell.—Page 4, Practice of Medicine, Oster.

*AN ACT to provide for the sanitary protection of the sources of water supply for the City of New York. Approved March 23, 1883.

†The New York Academy of Medicine realizing the vast importance of pure water, drafted and presented a bill providing for—

A Croton Water Commission, consisting of five members.

1. The Commissioner of Public Works—President.
2. The Commissioner of public Health—a Physician.
3. A member of the State Board of Health—a Physician.
4. A member selected by the Chamber of Commerce.
5. A member selected by the American Society of Civil Engineers.

This Board appoints a civil engineer who has power to carry out permanent plans, systems and methods for securing pure water. $50,000 is appropriated for the year 1883, and $20,000 for each year thereafter.

district which is surrounded on all sides with dwellings or stores and factories, is an area of many acres already piled from ten to twenty feet deep with foul and putrifying garbage. During the prevalence of a west wind this pest breeding spot can be smelled a mile or more from shore. With every south wind its pestilential odors are blown through the heart of the city. Its foul smell can be detected not only along the adjacent low-lying districts, but at elevations 300 or more feet above tide water and a mile and a half way. After a few hours south wind the course of this foul air can readily be traced by dull headaches, and latter by influenza and sorethroats if nothing worse.

From 250 to 300 loads are daily added to this pest heap, which in aggregate is more dangerous than a dozen well-conducted hospitals for pestilential diseases. Indeed when the truth is known, vastly more disease can be traced to these sources than to the hospitals; and in fact they are one of the prime causes making the maintenance of pest houses necessary. We have been recently treated to prolonged and bitter discussions as to where a pesthouse should or should not be located, when in our midst conditions are tolerated which are many fold worse than a pesthouse full of patients, and which may under favorable circumstances make a pest house out of the homes which we have built for ourselves and families, and which repeatedly fill those homes with air too foul to be pleasant and undoubtedly dangerous; and which greatly adds to the danger from the hundreds of local defects in our sewer system. It is not necessary to here anticipate a report now in progress of compilation, but it may be safely said that we are running risks which only our unparalled natural advantages enable us to do with partial impunity. That we do not entirely escape is known to every citizen, for there is not an intelligent being in this city who cannot recall many preventable deaths. Oft' times, alas, of relatives or friends.

These views are the result of years of observation, and are in harmony with centuries of experience. They may not meet the approbation of those whose interests lie in an easy and profitable disposition of this material, nor of those who desire a cheap filling for valuable tide lots. There are interests at stake in every community which are not in harmony with a proper administration of the law. But it is the imperative duty of every man to see that the true needs of the community are subserved. The hope is therefore expressed that the members and our guests will freely express their observations and views, for "in the multitude of counsellors there is safety."

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

IN presenting to our readers this month, the accepted designs for the Exposition Buildings of the Midwinter Fair, to be erected in Golden Gate Park, San Francisco, California, we think their importance warrants us in giving a short description of the most striking features of these structures, which present an agreeable variety of well planned buildings, that will effectively display the numerous exhibits that are to interest and entertain our own citizens, and we hope the citizens of other countries as well.

THE largest of the buildings is that to be devoted to Manufactures and Liberal Arts and was designed by A. Page Brown. It covers over 100,000 square feet of surface and is nearly 500 feet long. The exterior covering is to be "staff" treated to represent marble. The style of the building is Moorish and the prominence given to the entrances relieves the building from what otherwise would be a monotonous repetition of arches supported by twin columns. Four corner towers, richly and elaborately decorated, support domed roofs which it is the intention to cover with tiles. An interior gallery thirty-five feet wide extends around all four sides, and allows the visitor to survey the panorama spread before him below. Five flights of broad steps lead to these galleries, affording ample means of communication. The building is divided longitudinally into a nave with two side aisles, the nave being lighted by a clere story. The cost will be $100,000.

THE Administration Building was the last to be given out but it is one of the most important as it will be the business building, it is also by A. Page Brown. This structure is Oriental in outline, and in the detail of its ornamentation the Central Indian and Siamese are tastefully combined. The cost will be about $25,000.

THE building next in importance to that of Manufactures is the Mechanical Arts Building designed by Ewd. R. Swain, who derived his inspiration from the architecture of the Orient. Mr. Swain has, like Mr. Brown, made the main entrance the most prominent feature, and its massiveness is well relieved by the two delicate minarets that flank it. Color is to be lavishly introduced to heighten the effects, and we think the completed building will be second to none. The towers at the corners are provided with balconies that will allow the visitors to enjoy a general view of the grounds and obtain a more striking idea of their extent than could be obtained from a lower point of view. The estimated cost is about $65,000.

MR. C. C. McDougall's design for the Fine Arts building, was the one accepted by the Committee. In style Egyptian and in plan simple, it presents an imposing effect; the building is a rectangle, 136 feet by 72 feet. It is the only building designed to be a permanent structure, and is to be of brick, cemented, with ornamentation carved. The approach is to be flanked with sphinxes, and by setting the building back some 50 feet from the main driveway, an effective entrance is secured—the peculiar details of the Egyptian ornamentation have been carefully followed, and the lotus crowned columns and battered walls of the portico give the characteristic effect of Egyptian Architecture. The interior of the vestibule is to be a striking feature of the building. It will rise through two stories and the roof representing the "stepped" construction of the pyramid wall, through colored glass cast a soft light to the gallery. The estimated cost is $45,000.

FOR the Agricultural and Horticultural Building, Samuel Newsom has undoubtedly taken for the foundation of his work the Mission building, making free use of his own ideas to adapt it to all the requirements to which the building is designed and cannot be considered a servile copy of any order

of architecture. The great dome is a striking feature of the building, it will be 101 feet 6 inches in diameter and 90 feet high from the ground to the "lantern." The cost will not exceed $70,000 and will doubtless make an attractive feature of the Fair.

SECOND AWARDS.

THE proposed Mechanical Arts Building for the California Midwinter International Exposition, submitted by Edmund Kollofrath, architect, 58 Flood Bldg., and awarded second prize.

The building is of the oriental style and measures 275x175 feet with a boiler house annex, 25x60 and covers about 50,000 square feet, being the third largest in size.

There are three entrances, the main entrance in centre of building and two side entrances.

The entire building, except boiler house annex is to be constructed of wood the latter to be brick.

The main entrance is the principal feature and is covered by a large dome. The skylight on the roof is forty feet wide and running the entire length of the building. All the outside finish to be wood and staff painted in proper colors.

The gallery inside is about thirty-seven feet wide extending all around the four sides of building with two grand staircases at both side entrances and large offices, lavatories, etc. The estimate cost of building is about $75,000.

Mr. Kollofrath is also preparing elaborate plans for all the buildings of the "Vienna Prater" which will be one of the main features of the fair, it will cover about 72,000 square feet.

THE second premium design for the Agriculture and Horticultural Building of the Midwinter Exposition, illustrated in our present number, is the conception of Rowell & Benson, architects.

The drawing was submitted under the *nom de plume* of "Alhambra", and presents a building 300 feet long and 125 feet wide, designed after the Moorish type of architecture, the intricacies of ornamentation admissible in this style being concentrated around the entrances and especially the main entrance which it was intended to embellish in the ornate treatment of color and ornament distinctive of this style.

The roof is entirely of glass supported by a graceful system of iron trusses.

An open roof garden and promenade over-looking the grounds, extends along the front and is accessible from level of second story. The building complete would cost $69,600.

MR. Pelton has selected the Greek style as appropriate for the Fine Arts Building., While the various Oriental styles are eminently appropriate for those buildings which are to be built simply for this occasion, he questions the introduction into this building, of the gay treatment required in Oriental detail.

The permanency of this building, in fact, has been of the first consideration, in character, treatment of detail and construction. He proposes that the walls of the building shall be of brick, seventeen inches thick, with foundations of twenty-one inches thickness. The exterior and the interior surfaces of the walls, to be covered with the Fitzgerald wall finish or other material equally as good. The roof gallery construction and floors, to be of wood and to be protected with fire-proof material as per sample, wherever practicable. All mouldings, projections, decorative treatment, shall be done in Portland Cement, or other durable material. For the interior wood work he proposes to use native redwood and spruce. This building when completed would cost the sum of $35,000.

A design for Trinity School, San Francisco, is by Wm. Curlett, architect.

AN INVALID'S ROOM.

EVERY large family would be the gainer by having a special room in case of sickness. Just how and where this should be situated depends altogether on circumstances. If it is a large family with plenty of means, it is recommended that the room should be in the top of the house and in the southeast corner, with large windows, a pleasant outlook and an abundance of sunlight and air. Every necessary appliance should be at hand. Water and drainage are among the most important. One country family, where modern sanitary ideas are very well carried out, has a room built at the top of the house with the effect of a large square tower. This room has a register-pipe, a water tank and a drainage pipe, which is connected with an independent cesspool far out of reach of the yard or garden, and itself with drainage into porous subsoil. Any illness that seems at all obscure is a signal for removing the patient to the tower chamber, which is voted the most delightful room in the house. A force-pump supplies an abundance of water. There are a bath-tub, closets and all the requirements of the invalid's apartment. This tower, being practically a fourth story of the house, has been arranged with a lift, operated by strong pulleys and heavy weights. There are four pulleys, one on each corner of the box, which is in dumb-waiter fashion. If the care-taker is a heavy person, there are extra weights to attend, and there is also a cord and a tackle-pulley from the middle of the box to a strong cross-beam in the roof and a corresponding one below. By this means the speed and lifting capacity of the appliance are easily controlled. The cost of the thing is a mere trifle compared with its convenience; and as in one corner of the box there is a rack for a tray, it is easy to do all the necessary running up and down-stairs.

A well-adjusted bell from the sick-room to the sitting-room below has a cord with-in reach of the sick person's hand. This room is available not only for the actual sick, but for the weary one who wants to get away from noise, and who goes up, fastens her jaunting car and locks her door with a sense of comparative security from interruption. It is not only the invalid's room, but in days of health the restful annex for several members of a large and busy household.—*N. Y. Ledger.*

The ancient Hammond house, at Marblehead, Mass., is being torn down and some of its spruce timbers, which have been protected from rain and wind for over two hundred years, are being largely sought after by violin makers to use in the manufacture of their instruments.—*Architecture and Building.*

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute of Architects, meets second Friday of each month at 408 California street.
Geo. H. Sanders, Pres. W. J. Cuthbertson, Vice-Pres.
Oliver Everett, Sec. John M. Curtis, Treas.

Technical Society of the Pacific Coast, meets first Friday of each month at Academy of Sciences Building.
C. E. Grunsky, Pres. Charles D. Marx, Vice-Pres.
Otto Von Geldern, Sec. Geo. F. Schild, Treas.

California Electrical Society, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
Geo. P. Low, Pres. C. O. Poole, Vice-Pres.
Max Caspari, Sec. H. T. Bestor, Treas.

NEW CITY HALL TOWER.

THE following is the report made by the San Francisco Chapter A. I. A. on the proposed Tower for the New City Hall, designed by Augustus Laver and submitted by him some years ago to the then City Hall Commissioners. In view of the fact that the subject matter is again occupying the attention of the Commissioners and the public, we believe the report will be of interest:

First—They consider that the design submitted by Mr. Laver for the New City Hall Tower is in itself well adapted in its external architectural features, to complete and adorn the building to which it is to be added. The height—which has been more or less called in question, is considerable—but is not, in the opinion of the Committee, in excess of the proportions permissable in so vast a structure as that to which it is to be applied. On the contrary, in view of the enormous frontage and other dimensions of the New City Hall, it would be difficult to fix an assignable limit, beyond which it would not be possible to harmonize and proportion a structure of this description under given conditions.

They find also, that the mansard roof, so called, in both the modified as well as the complete example exhibited in the drawings submitted to the Committee, while serving to fill up and prepare the structure for the reception of the tower, is by no means indispensable—at the same time it establishes the fact—that should additional space be at any time required, the same may be obtained by its addition, with advantage, whenever deemed desirable.

They find, however, upon examination of the internal structure of the proposed tower, that on account of the position and nature of the bearings available, it will be necessary to construct it in iron instead of the solid material composing the walls of the complete portions of the building. They also find that in order to perfectly adapt the designs submitted by Mr. Laver, to the existing structure some additions to or modifications of the plans submitted to the Committee, seem necessary; but these considering the comparatively and necessarily immature condition of the drawings, are probably intended by Mr. Laver in the final execution of the work when determined on. In the mean time your Committee with this proviso, beg to suggest that in their opinion, to secure the entire stability of the superstructure, the iron beams forming the foundations of the whole should be extended under the projections at the angles of the tower, no provisions for that purpose appearing on the drawings as submitted to the Committee. They also think that a broad sill plate composed of wrought iron beams and top and bottom plates should be placed on the circular brick wall surrounding the great circular hall under the tower. This would serve to equalize and distribute all unequal strains and bearings and rectify any possible defects in the foundations of this part of the building. The Committee deem this provision absolutely necessary, for though the construction of the tower (which is of wrought iron, steel and sheet metal) is of the slightest practical description, the weight of the whole tower will be in the neighborhood of three thousand tons. But dead weight alone is not the only consideration since the variable strains caused by windage will be very considerable under even ordinary circumstances, and there are times when, at such a height, the velocity of the wind will mean several hundred tons added to the ordinary weights at different points of the circle.

Second—For the above reasons, while the committee have full confidence in the ability of Mr. Laver to carry to completion the excellent design proposed by him in as satisfactory and substantial a manner as is possible under the circumstances and with the materials at his command, they feel compelled to say in view of the various objections which may be urged against the erection of any structure of the sort proposed, that they believe some such type as that adopted by the First Commissioners, would be found on the whole more suitable for the purpose than the new and loftier design, though in the nature of thing, less imposing in appearance and less in proportion to the size and importance of the building. The difficulty and expense of keeping such a structure in repair and proof against the destructive effects of climate and season, is a powerful argument, though one of an economical rather than artistic nature, in favor of reducing as much as possible the area and especially the height of the exposed surfaces. And here your Committee would suggest that instead of employing materials such as galvanized iron or steel in the external casing of the tower, which would need the preservation applications of some sort of paint, and would lead, as before stated, to endless repairs, they are of opinion that the use of copper though of greater prime cost, would in the end prove of much more economical and of vastly greater architectural value, as it is a material beautiful and artistic in its application and effect and eminently durable and in every way admirably adapted to the work proposed.

Third—This brings your Committee to their last and final position—while they fully concede the many points of artistic merit as a whole, of both designs exhibited in Architect Laver's projects for the proposed tower of the New City Hall, and while they are quite ready to admit the *possibility* of their construction with safety and substantiability compatible with materials of such a perishable nature as those rendered necessary by the adoption of the peculiar method of construction hitherto submitted, they are not so ready to admit the *advisability* of such a course; and in view of the conditions existing in the present building—consisting as they do—of a great circular chamber some eighty feet in diameter, surrounded by a massive brick wall, and including a circular peristyle of columns some sixty feet in diameter from centers, they believe that the possibility exists of erecting a perfect unique structure in the form of a circular tower, or dome tower which would offer features superior to any square structure yet proposed—and that before either of the designs now before the Commissioners are finally decided upon, Mr. Laver should be requested to furnish, as an alternative, such a design—homogeneous in material with the existing building and equal to it in durability, and as free from necessity for endless protection and renovation.

Such a structure, we believe, would not only redound to the credit of all concerned in its production, but would ultimately be found to be of great economical advantage to the city generally.

It would be of a height proportioned to its possible diameter and would compensate in dignity of material for comparative lack in magnitude, though a tower or dome of more than ninety feet in outside diameter, is one out of which it would seem that a very grand and imposing structure could surely be evolved. All of which should be left with confidence to the well known genius and artistic ability of the Architect of the building.

NOTICE TO ARCHITECTS.

Olympia, Wash., August 24, 1893.

PLANS and designs for a State Capitol building will be received until 2 P. M. on the fourteenth day of December, 1893, at the office of the state Capitol Commission, in the city of Olympia, State of Washington.

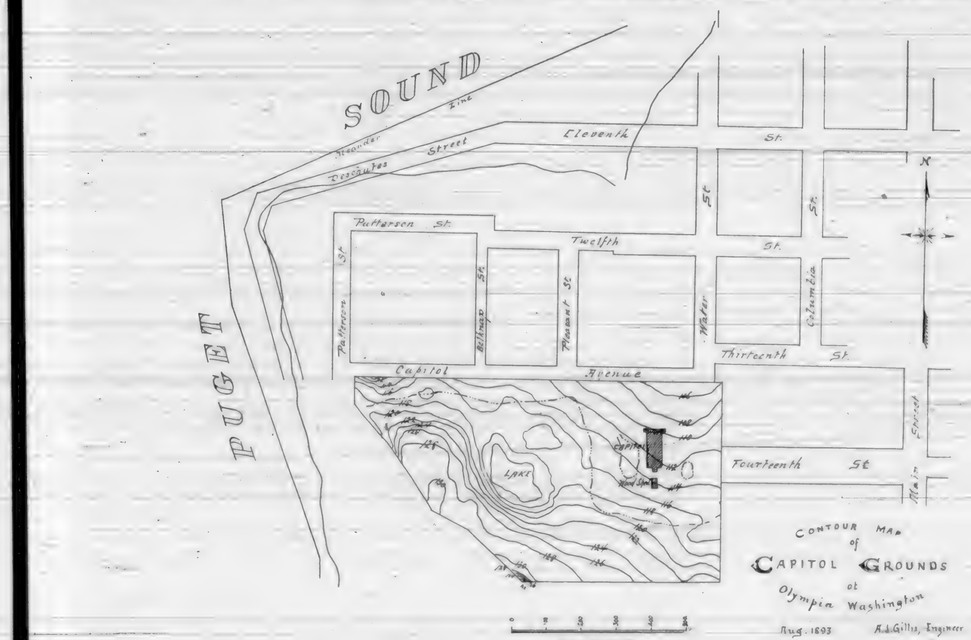
Following is the invitation extended to architects to submit competitive designs:

A map of the grounds, which appears in this issue, shows the location of the present capitol which is to be removed. It also shows the contours of the ground. The new building is to be placed in the most sightly portion, and the Commission desires the suggestions and judgment of the competing architects on this subject.

The principal material to be of stone, for walls, with brick for backing and interior walls, where not objectionable, and the building to be as nearly fire-proof as practicable. As the expenditure permitted by the act authorizing the building of the State Capitol is limited to $1,000,000, architects must confine their designs to this amount, avoiding extreme or superfluous ornaments. The Commissioners prefer appropriate proportions and solidity of design, but provision must be made for the several departments and the various state officers specified in the schedule herewith.

Ample provision must be made for heating by steam apparatus, ventilating by approved methods, and lighting by gas and electricity, the building to consist of a basement and three stories.

The schedule appended sets forth the various state officers, and departments for the accomodation of the executive, legislative and judicial bodies, and provisions must be made for all these officers in the most appropriate parts of the building, and for all other uses of a modern capitol building. The arrangement of the various rooms and departments is left to the judgment of the competing architects.



EXPLANATORY:

The datum to which these contours are referred, is the city base, or practically, high tide of Puget Sound. From the West boundary the ground falls abruptly to the Sound, from the North it slopes gently to 12th street and then drops suddenly. Fourteenth street from Main to the grounds will require to be graded and this with the earth from the foundation will probably bring the whole ground to an elevation of about 115. South of the long dotted line and inside the dotted rings, is a fine growth of young firs 60 to 100 feet high. The lake can be made an ornament to the grounds or can be drained and filled. The site is a commanding one, but the views to the North and the East are especially fine; and a "front" in each of these directions would probably be about the right thing to build.

The following rules are to be observed by architects proposing to submit designs for competition:

First—The drawings are to be made to the scale of sixteen feet to the inch, and to consist of four elevations, one section, and one perspective drawing.

Second—No colors are to be used on the drawings except to designate material on plans and sections.

Third—The building must be as nearly fire-proof as practicable.

The following premiums are offered:

First—The employment of the architect submitting the plan and design accepted by the Commission, as the architect

of the building.

Second—One thousand five hundred ($1,500).

Third—One thousand dollars ($1,000).

Fourth—Five hundred dollars ($500).

Provided that no architect shall be paid more than one premium, and all of which designs are to be considered the property of the state.

A brief typewritten description may accompany drawings, calling attention to points of special importance.

No plans or papers submitted are to have upon them any mark by which they can be known, but there shall be sent enclosed with them a sealed letter addressed in typewriting to the Governor, who is chairman of the Board, giving the author's name and address. This letter will not be opened until the award shall have been made. The drawings and papers will be known by numbers corresponding with numbers given to the letters.

Following is a list of the various state officers: Governor, Lieutenant Governor, Secretary of State, Treasurer, Auditor, Attorney General, Superintendent of Public Instruction, Commissioner of Public Lands, State Land Commissioners (four), State Printer, State Librarian and Adjutant General.

A senate chamber (maximum number, 50), house of representatives (maximum number, 100), together with necessary committee rooms, will constitute the legislative department.

The judicial department consists of a Supreme Court of five members and Clerk of the Supreme Court.

In addition to the offices provided for the above named officers, there should be rooms of convenient sizes for clerks, and also vaults, wash and cloak rooms and closets.

The arrangement of rooms and location in the building, size, etc., are left to the judgment and intelligence of the competing architects.

The commission reserves the right to reject any and all plans and designs, and to readvertise for the submission of further plans and designs.

J. W. MCGRAW, Chairman,
L. R. GRIMES,
J. N. GLOVER,
JOHN MCREAVY,
EDMUND RICE,
Commissioners.

THE LUMBERMAN'S ACTUARY by John W. Barry. The very book that every contractor needs—here we find tables in a compact form just suitable for the pocket, showing at a glance the amount of any number of feet between two feet and 25,000 feet at any price between $6 and $50 per thousand feet, thus at $6, $6.50, $6.75, $7 and so on to $50, also showing the feet in any number of pieces between one and 1,000 pieces for any thickness as inch and one-quarter, etc., up to 24 inches.

Price $2.50 per copy net, address, John W. Barry, Fairbury, Nebraska.

HOW TO FRAME A HOUSE or Baloon and Roof Framing by Owen B. Maginnis. Published by the author, 356 West 124th street, New York, price one dollar. Intended as an indispensable book for carpenters, builders, foremen, journeymen, etc. Illustrated and explained by over thirty engravings of Houses and Roofs.

LIPPINCOTTS' MAGAZINE for September contains the complete novel called "A Bachelor's Bridal" by Mrs. H. Lovett Cameron. It tells of an unconventional and ill-starred marriage and its tragic consequences. Mr. and Mrs. Dickens will be read with interest by all lovers of Boz.

HICKS' BUILDERS' GUIDE.—Comprising an easy system of estimating material and labor for carpenters, contractors and builders, by I. P. Hicks, illustrated by numerous engravings of original drawings. David Williams publishers, 96–102 Read street, New York.

This handy little volume cannot but prove useful to the class intended, and leaves no excuse for the contractor to leave anything out of his estimate, if he consults its pages.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

PERFORMANCE OF CONTRACTS.—In an action by a contractor for constructing a building, the owner cannot set-off damages for his failure to complete the building within the time prescribed by the contract, where each failure was due solely to his own negligence.
White v. Fresno Nat. Bank. Supreme Court of Cal. 32 Pac. Rep. 979. 44.

LIABILITY OF EMPLOYER.—If an employee is injured by reason of the negligence of the foreman or superintendent in charge of the work, he can only recover against the employer when the foreman or superintendent was negligent in performing the duties which the law imposes on the master personally, and cannot recover if the superintendent was merely negligent in the performance of such work as properly pertains to a servant.
Stockmeyer v. Reed Circuit Court D. Ind. 55 Fed. Rep. 259. 69.

FORECLOSURE OF MECHANICS' LIENS.—The fact that a state statute gives an action at law to enforce a mechanics' lien will not deprive the Federal courts of jurisdiction to enforce such liens by bill in equity, for the question whether legal or equitable remedies shall be adopted by the Federal courts is determined not by the state practice or legislation, but by the nature of the case and the foreclosure of a mechanics' lien is essentially an equitable proceeding.
Sheffield v. Furnace Co. v. Whitherow, 13 Supreme Court Rep. 937. 78.

RIGHT OF ADJOINING OWNERS TO LATERAL SUPPORT.—The statute which provides that each coterminus owner is entitled to the lateral and adjacent support which his land receives from the adjoining land, subject to the right of the adjoining owner to make excavations for construction on using ordinary care to sustain the land of the other, and giving previous notice of his intention, is merely declaratory of the common law; and while a coterminus owner has the right to the support of his soil in its natural state by that of his neighbor, such right does not extend to the support of any additional weight or structure he may place thereon.
Sullivan v. Zeiner, Supreme Court of Cal. 33 Pac. Rep. 209. 97.

BREACH OF BUILDING CONTRACT.—Where the contract provided that the contractor should erect a building before a certain date for a specified price, to be paid in four installments, each payment to be made when certain work had been performed, and that if the contractor failed to furnish at any time sufficient material or workman, the owner after three days' notice might proceed with the work and deduct the expense from the contract price. The fact that the contractor was dilatory in the work from the beginning did not entitle the owner to refuse to pay the second installment when the same was fully earned, and afterwards terminate the contract as for a breach thereof by the contractor. Where the owner had acquiesced in such delay up to the time when such installment became due.
Smith v. Corn Common Please of N. Y. city and county, 23 N. Y. Supp. 326. 136.

LIABILITY OF CARRIERS OF PASSENGERS IN ELEVATORS.—A landlord who runs an elevator for the use of his tenants and their visitors thereby becomes a common carrier, and is charged with the highest degree of care which human foresight can suggest, both as to the machinery and conduct of his servants; and an instruction that he owes to persons thus put completely under his control, the highest degree of care consistent with the possibility of injury, while unfortunate in the choice of words, does not misstate the law, and, being explained by the context, is no ground for reversal. A person who undertakes to run an elevator to carry passengers who intrust themselves entirely to his care and control, is charged with the duty of providing experienced and skillful servants for that work; and that standard of due care for an elevator man is that care which may reasonably be expected of an elevator man of skill and experience.
Marker v. Mitchell Circuit Court S. D. Ohio 56 Fed. Rep. 637. 158.

VALIDITY OF LIEN ON PORTION OF BUILDING.—A building contract provided for adding to an old building on part of a lot, and the erection of a new building on the other part. Mechanics' liens were filed for the construction of the addition to the building situated on that portion of the lot covered by the old building. The complaint in an action to foreclose such liens alleged that the contractor agreed to provide all the materials, and change into a two-story building the one-story building then on the premises described. Such allegations were not denied. The findings supported the allegations, and the judgment followed the findings. The judgment was not up to the objection that it was invalid because the liens were filed on a portion of the building only. The fact that the notice of liens described the building as situated on a certain number of feet of a certain lot, while the complaint describes it as situated on the entire lot, causes no variance and is immaterial.
Brunner v. Marks, Supreme Court of Cal. 33 Pac. Rep. 265. 177.

WHO MAY CLAIM MECHANICS' LIENS.—Where the statute provides that mechanics' material men, contractors, sub-contractors, etc., shall have a lien upon the property upon which they have bestowed labor or furnished materials for the value thereof, and that in case of a contract for the work between the owner and his contractor, the lien shall extend to the whole contract price. All such contracts must be in writing when the amount to be paid thereunder exceeds one dollar, and must be recorded. Otherwise they are wholly void and no recovery can be made thereon by either party thereto. In such case the labor done and materials furnished by all persons aforesaid except the contractor, shall be deemed to have been done and furnished at the personal instance of the owner, and they shall have a lien therefor. A contractor who fails to record his contract, where the agreed sum to be paid exceeds $1,000, can have no lien. In such case the contractor cannot claim a lien under the first part of the section on the ground that, his contract being void, he may recover on an implied contract for the services and materials furnished; since, though under the common law, he may be entitled to recover on an implied contract, he cannot have a lien, as the lien is created by the statute solely, and the statute must be complied with.
Spimley v. Griffeth, Supreme Court of Cal. 32 Pac. Rep. 974. 232.

BUSINESS MOSAICS.

Wire Glass—Nothing on the market so completely fills the bill, and supplies a long felt want as wire glass for skylights, vaults, etc. What is wire glass some may inquire? It is a sheet of glass having embedded in its centre a sheet of wire netting of any required size of mesh. Manufactured by the American Wire Glass Manuf. Co., Tacony, Philadelphia and for sale in this city by Jas. A. Maguire, 130 Sansome street.

"What kind of a roof is that?" she asked looking up at a mansard roof.

"Oh! that is a roof that takes 'man's hard' earnings to build," he replied.

F. H. Rosenbaum & Co.—We take pleasure in calling attention to the splendid collection of Mirrors of their own manufacture, both quicksilver and patent back. To those in want of plate and window glass we advise a call should be made at 567 Market street, opp. Sansome.

"I love to see the dear little lambs capering about in the spring."

"So do I; though they taste better when the capers are on the lamb."—*Truth.*

George Goodman—If you have a sidewalk or garden walk, made by the above named gentlemen, you can say of it what the late Bishop Brooks said of the baby, "that is a sidewalk," 307 Montgomery street is the headquarters of Artificial Stone.

Husband—"I think I shall go out and catch a few fish for our dinner to-morrow."

WIFE—"No, Edwin, we must economize. Buy them of the regular dealer."—*Tribune.*

Western Iron Works, 123 and 125 Beale street are still on hand to supply architects, contractors and others with wrought iron and steel building work of all kinds and dimension desired, also sole manufacturers of Champion Wheelbarrows. See advertisement upon first page.

Snooper—"Don't you think we ought to have free baths?"

SKIDMORE—Free baths are not sufficient, sir. What is needed is compulsory baths.—*Brooklyn Life.*

The Bostwick Fire-Proof Steel Lath.—We have had occasion several times before, to call the attention of the Architects and Contractors, in these columns, especially in our own growing city, San Francisco, of the very many excellent qualities of the Bostwick Fire-Proof Steel Lath.

This Lath is the recognized, standard metal lath on the Pacific Coast; and more yards have been sold in San Francisco and Los Angeles, in the past two years than any other metal lath on the market. It is Stiff, Ridged, Smoke, Fire, Rat and Bed Bug Proof, and is the most economical in plaster, making a perfect double tie or clinch around the loops on back of lath. Reference can be made to many of our large buildings in this city, and many of the large office and apartment buildings in Chicago, St. Louis, Boston and New York. This lath is adapted to the use of any kind of mortar or patent hard plaster, and where other metal laths, require two tons to the one hundred yards, the "Bostwick" will do the same work with only half, there being no waste at all, showing its superiority over wire, etc.

Architects, Contractors and any one who contemplates building, will consult their interests by calling on Messrs. Smith & Young at 727 Market street, who are the State agents for this lath, and they will furnish any information needed; or to the Bostwick Steel Lath Co., Niles, Ohio.

CITY BUILDING NEWS.

Boyce near Point Lobos Ave. To build; owner, Rosl Bunrhart; contractor, H. V. Acker; signed, Aug. 28; filed, Aug. 30; cost $3,000.

Broderick near Ridley. Alterations; owner, John Caley; architect, Robert Ewing; contractors, Henry C. Robinson and Wm. J. Gillespie; signed, Aug. 10; filed, Aug. 16; cost $2,710.

Broderick near California. To build; owner, Mrs. C. Harker; architect, S. A. Batchler; contractor, T. R. Bassett; signed, Aug. 29; filed, Sept. 1; cost $4,000.

Broadway near Steiner. To build; owner, Martin Van Buren Watson; architect, J. B. Matthison; contractor, A. Jackson; signed, Aug. 21; filed, Aug. 23; cost $2,700.

Bryant Ave. near 25th street. To build; owner, John P. Farrell; contractor, John Keney; signed, Aug. 28; filed, Aug. 30; cost $1,259.

Bryant between 2d and 3d Sts. Alterations; owner, Thomas Gihon; architects, Shea & Shea; contractor, James E. McConahey; signed, Aug. 29; filed, Sept. 1; cost $1,379.

California near Franklin. To build; owner, Henrietta Zeile; architect, Clinton Day; contractor, C. Chisholm; signed, Aug. 10; filed, Aug. 12; cost $16,662.

California near Drumm. To building; owner, Luning Company; architects, Coxhead & Coxhead; contractors, Pacific Patent Plaster Co.; signed, Sept. 6; filed, Sept. 8; cost $5,800.

Day and Sanchez. To build; owners, Michael & Margaret Tiernan; architect, Chas. I. Havens; contractor, M. Loftus; signed, Aug. 25; filed, Aug. 25; cost $2,220.

East and Filbert. Four two-story frame buildings covered with sheet iron lathing and cement; owners, Lunning Co.; architect, A. C. Hussey; contractors, Gallagher & Milburn; signed, Aug. 25; filed, Aug. 29; cost $10,800.

Eighth near Natoma. Carpenter work, etc.; owner, S. H. Williams; architects, Hochholzer & McHenry; contractor, I. P. Shepard; signed, Aug. 31; filed, Sept. 1; cost $2,200.

Eighth near Natoma. Brick work; owner, S. H. Williams; architects, Hochholzer & McHenry; contractor, James O'Sullivan; signed, Aug. 31; filed, Sept. 1; cost $2,467.50.

Eighth near Minna. Brick work and excavation; owner, Isabella T. Barto; architects, Hochholzer & McHenry; contractor, James O'Sullivan; signed, Aug. 31; filed, Sept. 1; cost $2,432.50.

Eighth near Minna. Carpenter, plumbing, plastering, etc., except brick and iron; owner, Isabella T. Barto; architects, Hockholzer & McHenry; contractor, J. E. Mooney; signed, Sept. 11; filed, Sept 11; cost $3,270.

Eureka near 20th. To build; owners, Geo. and Jennie Colter; architect, W. H. Wharff; contractors, Sandy & Gillogley; signed, Aug. 12; filed, Aug. 16; cost $1,500.

Fifth Ave. near D. Two-story frame; owner, Julia Herzo; architect, C. M. Rousseau; contractor, L. B. Schmid; signed, Aug. 23; filed, Aug. 24; cost $2,320.

Florida and 21st. One-story frame; owner, F. Lassere; architect, Chas. M. Rousseau; contractor, David Emerson; signed, Sept. 6; filed, Sept. 7; cost $1,800.

Front near Pine. Repairs; owner, Estate of Ralph W. Kerkham; architect, Chas. W. Geddes; contractor, Geo. R. Lang; signed, Sept. 6; filed, Sept. 7; cost $2,250.

Fulton near Octavia. Three-story and basement; owner, Bernhard Bernhard architect, E. J. Vogel; contractor, F. V. Steinman; signed, Aug. 25; filed Aug. 28; cost $5,675.

Fulton near Octavia. Concrete steps, etc.; owner, Bernhard Bernhard; architect, Edward J. Vogel; contractor, T. E. Keough; signed, Aug. 25; filed, Aug. 26; cost $1,240.

Fulton near Octavia. Plumbing; owner, Bernhard Bernhard; architect, E. J. Vogel; contractors, Wilson & Wilson; signed, Aug. 25; filed, Aug. 26; cost $1,150.

Goettinger near Wayland. One-story cottage; owner, Mrs. M. F. O'Connor; contractor, H. Lehouse; signed, Aug. 5; filed, Aug. 14; cost $850.

Howard bet. 20th and 21st. Alterations; owner, Mme. T. Cleinelus; architect, Emile Depierre; contractors, Schutt & Kreeker; signed, Aug. 21; filed, Aug. 22; cost $1,975.

Hyde near Geary. Three-story frame; owner, I. Label; architects, Kemitzer & Barth; contractor, J. W. Hansbrough; signed, Aug. 31; filed, Sept. 1; cost $5,541.

Jessie near 6th. A church; owners, The Swedish Evangelical Mission Church. architect, S. Babson; contractors, G. Patterson & S. Persson; signed, Aug 10; filed, Aug. 15; cost $9,195.

Jersey near Castro. Two-story tenement; owner, Jens R. Jorgensen; contractor, Casper Zwierlein; signed, Sept. 4; filed, Sept. 4; cost $3,400.

Julian Ave. near Fifteenth. Brick work, etc.; owner, Simon Fitzpatrick; archi. tect, J. Y. Ayers; contractors, Frank Schnadt & J. C. F. Corbett; signed, Sept 4; filed, Sept. 5; cost $1,670.

Kearny bet. Pine and California. Side walks and vaults; owners, Hyman Bros.; architects, Wright & Sanders; contractors, Worrell & Miller; signed, June 29; filed, Aug. 15; cost $1,320.

Lyon near Turk. Two-story frame; owner, P. J. Shea; architects, Shea & Shea; contractor, A. Stevens; signed, Aug. 21; filed, Aug. 23; cost $2,968.

Mason near Eddy. Painting; owner, S. Silverberg; architects, Salfield & Kohlberg; contractor, Jos. Stoctzen; signed, Aug. 15; filed, Sept. 7; cost $1,075.

Mason near Eddy. Wood work, iron lathing and plastering; owner, S. Silverberg; architects, Salfield & Kohlberg; contractors, Pacific Patent Plaster Co.; signed, Aug. 18; filed, Sept. 7; cost $3,000.

Octavia bet. Broadway and Vallejo. Alterations and additions; one-story cottage; owner, H. S. Stafford; contractor, Edward Mooney; signed, Aug. 28; filed, Aug. 28; cost $2,250.

Page near Schroder. Two-story frame; owner, Maria C. Droger; architect, E. Burns; contractor, I. G. Adams; signed, Aug. 29. filed, Aug. 29; cost $7,263.

Pixley near Fillmore. To build; owner, Lewis Rapp; architect, Wm. Schrof; contractor, Albert Norton; signed, Aug. 19; filed; Sept. 6; cost $4,200.

Post and Leavenworth. Excavation; owners, S. F. Verein Association; architects, Salfield & Kohlberg; contractors, James O'Brien; signed, Aug. 24; filed, Sept. 7; cost $940.

Post and Powell. Concrete foundations, etc.; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, Geo. Goodman; signed, Aug. 2; filed, Aug. 31; cost $4,432.

Post near Powell. Grading, trenching, etc.; owner, Mrs. A. M. Parrott; architects, Pissis & Moor; contractors, P. H. Norton & A. J. Meadows; signed, Aug. 16; filed, Aug. 28; cost $3,000.

Post street No. 609. Sidewalk lights, brick, etc.; owner, Marten O'Day; architect, Chas. I. Havens; contractor, R. Ringrose; cost $597.

Post and Montgomery. Granite stone work; owner, Union Trust Co.; architect, Clinton Day; contractors, Raymond Granite Co.; signed, Aug. 23; filed, Aug. 28; cost $36,500.

Post and Montgomery. Pumping, fencing, etc.; owners, Union Trust Co.; architect, Clinton Day; contractor, John McCarthy; signed, Aug. 23; filed, Aug. 28; cost $50.

Precita Ave. near Mission. To build; owner, P. J. Silk; architects, Martens & Coffey; contractor, M. Loftus; signed, Sept. 2; filed, Sept. 5; cost $3,500.

Sacramento near Drum. Excavation, asphaltum work, etc.; owner, Henry Pierce; architect, Clinton Day; contractors, Gray Bros.; signed, Aug. 14; filed, Aug. 16; cost $4,095.

San Carlos Ave. near 18th. Alterations; owner, Hannah Huntimann; architect, M. J. Welsh; contractor, James McConahey; signed, Aug. 12; filed, Aug. 12; cost $2,075.

Seventeenth and Douglass. Two-story frame; owner, C. Seelling; architect, F. P. Robin; contractor, F. Schaant; signed, Aug. 24; filed, Aug. 24; cost $3,929.

Sutter street No. 912. Alterations and additions; owner, Theo. P. Schaller; architect, Fred. P. Rabin; signed, Sept. 8; filed, Sept. 8; cost $1,725.

Thirtieth near Sanchez. Carpenter work for two-story frame; owners, W. F. Geimann and wife; architect, N. A. Comstock; contractors, Gallagher & Milburn; signed, June 7; filed, Aug. 16; cost $1,725.

Twenty-first near Dolores. Two-story frame; owner, A. McNab; contractor, C. T. Emmons; signed, Aug. 24; filed, Aug. 26; cost $2,800.

Union near Taylor. Carpenter and mill work, electric and marble work, etc.; owner, Anna A. Martens; architects, Salfield & Kohlberg; contractor, G. Forber; signed, Sept. 7; filed, Sept. 8; cost $5,000.

Union near Taylor. Brick work, mantels, excavation; owner, Anna A. Martens; architects, Salfield & Kohlberg; contractor, H. H. Larsen; signed, Sept. 7; filed, Sept. 8; cost $490 and $14 per M for foundation wall.

Union near Taylor. Plumbing and gas fixtures; owner, Anna A. Martens; architects, Salfield & Kohlberg; contractor, H. Williamson; signed, Sept. 7; filed, Sept. 8; cost $1,094.

ALAMEDA COUNTY.

Clinton Ave near Walnut. Brickwork, carpenter work, etc.; owner, Grace M. Davis; architects, C. H. Koster & Son; signed, Aug. 24; filed, Aug. 25; cost $2,592.

Eighteenth and 10th Ave., Oakland. Carpenter work painting, etc.; owner, Jas. Presho; architect, I. C. & E. A. Mathews; contractors, Leiter & Prugh; signed, Aug. 17; filed, Aug. 18; cost $3,887.

Essex street near Ashbury station, Berkeley. Cottage; owner, W. C. Bissell; architect, J. Conant; contractor, W. Bissell; cost $1,700.

East Oakland, lot 16. To build; owner, Peter Rueck; architect, N. A. Ment; contractors, W. H. Stevens & E. Woods; signed, Sept. 4; filed, Sept. 7; cost $1,574.

Fruitvalle Ave. bet. Hopkins street and Chicago Ave., Brooklyn. To build; owner, Geo. J. Haus; architect, Huge W. Stouch; contractor, H. A. Klyce; signed, Aug. 19; filed, Aug, 28; cost $1,985.

Jersey near Castro. Two-story building; owner, J. R. Jorgensen; contractor, C. Zwierlein; signed, Sept. 4; filed, Sept. 4; cost $3,400.

Myrtle near 10th, Oakland. To build; owner, Claus H. Kuchs; architect, Chas. Mau, contractor, C. C. Durkee; signed, Aug. 17; filed, Aug. 21; cost $3,014.

Oakland, block 283, lots 19, 20 and 21. To build; owner, James E. Johnson; architects, Cunningham Bros.; contractor, C. W. Bolles; signed, Aug. 26; filed, Aug. 28; cost $3,900.

Shell Mound Park tract, Oakland. Pile-driving, carpenter work, etc., to shooting hall; owner, Capt. L. Liebe; architect, H. Geilfuss; signed, Aug. 26; filed, Aug, 28; cost $1,420.

Strip of land by country road, Irvington to Centerville. Carpenter work, etc.; owner, D. E. Groverne; architect, A. L. Tundereo; contractor, M. H. Lewis; signed, Aug. 15, filed, Aug. 29; cost $1,860.

Twelfth and Washington, Oakland. Lathing and plastering; owner, Henry, Sol and Fred Kahn; architect, W. J. Mathews; contractors, Geo. P. & J. T. Smith; signed, Sept. 2; filed, Sept. 4; cost $2,000.

Washington, San Arnigos Vineyard. Frame winery; owner, E. P. Werner and E. A. Gear; architects, Percy & Hamilton; contractor, Chas. Riedel; signed, Aug. 17; filed, Aug. 17, cost $1,450.

THIS journal is prepared to take charge of rendering perspective drawings in pen and ink or color. Charges will depend on size and kind of drawing wanted.

THE Commissioners who have charge of Golden Gate Park deserve much credit for the manner in which they have endeavored to make the quarters devoted to the Children's Playground, enjoyable to the younger generation.

The many attractions that are there especially provided for the young folks, and meant for their exclusive use and enioyment, furnish them with an infinite amount of innocent amusement and harmless recreation, and merit the thanks of the citizens at large as well as of the parents in particular.

To keep the minds of the children busy, and their bodies actively engaged in lively sport, is to lay the foundation of an active and virtuous citizen. A sound mind and a healthy body are of the most vital importance to the rising generation and should be the birthright of every human being; to keep these gifts of nature in proper condition is the duty of, should be the pride of both parent and citizen.

It is as vitally important as the education of the youth, which it is conceded to be the duty of the Municipality to provide for. Seldom, however, is adequate provision made for the employment of children's time outside of school hours, and we believe that in this connection, more consideration should be bestowed on suitable methods of providing proper grounds to be used for the recreation and amusement of the children, where they could pursue their games without interruption, and free from the charge of being an annoyance to their elders.

For this purpose we would advocate the establishment of public play grounds and gymnasia in the city itself, even should it be necessary to convert some of the present parks and squares to this use.

This would be particularly beneficial in the more crowded portions of the city, where the children are forced to play in

the streets, to the annoyance of the public, and danger to themselves; or in cramped back yards and alleys, too restricted for the purpose.

In this respect the country bred youth has a material advantage over the children of the city.

The importance of keeping the child properly occupied in mind and body, can hardly be overestimated. Give a child no way of employing his surplus energies, and they will be turned to mischief. If the youth has no legitimate sport to occupy his time, he will the easier drift into vice, as the old saying is still true:

"Satan finds some mischief still for idle hands to do."

THE buildings that are illustrated in last months issue, as designed to house the exhibits of the Minwinter Fair, are now rapidly assuming form and shape in Golden Gate Park. Towers are seen rising above the tops of the surrounding trees, and the contractors state that the vast buildings will positively be completed in time to have the exposition open on the first day of the coming year.

THE INCONGRUITY OF MANY MODERN COUNTRY PUBLIC INSTITUTIONS.

ONE of the greatest faults of those having in charge the erection of public buildings and institutions situated in the country amongst large and extensive surroundings, is their failure to duly appreciate the proper relation of buildings to surroundings and their relative effects upon each other.

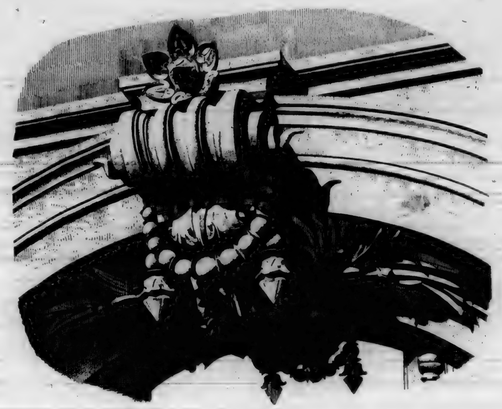
These facts were very forcibly called to my attention not long ago, in one of our interior counties, where I saw a four story administration building with towers, crowning the summit of a hill, and giving me the effect of confinedness and misplacedness and the impression that land must be very valuable in the vicinity, to necessitate the huddling together in one tall mass, of buildings that could have been spread over more ground to better advantage, though they were really situated in the middle of an extensive domain.

These remarks are made for the purpose of calling attention to the fact, in the hope that repetitions of these errors may be avoided in the buildings to be erected in the near future under similar conditions, and which appear to have been designed on the same lines. I hope my remarks may be the means of preventing such incongruities being repeated.

I have left out in this squib the practical and economical objections to high buildings which are intended for the use of old, invalided or young people, such as the requiring of elevators and such like, and have confined myself simply to the æsthetic phase of the question which alone is sufficient to condemn it, when such buildings are placed in the midst of extensive grounds.

Yours,

STROLLER.



SONNET.

Chicago! Teeming centre of the land,
Thy western land from which thou hast up-sprung,
Strong limb'd, full breasted, comely fresh and young
Tall and majestic, thou a queen doth stand!
The nations hither, gather in a band,
Viewing in wonder the jewels thou hast strung;
In stately splendour see their shadows flung
O'er lake and lagoon, in blanche'd beauty grand.
What priceless gems hast gathered in they hand!
Pearls of sentiment, and flashing diamonds bright,
Radiant with rays of intellectual light:
But higher, holier *still* the world's demand
Doth sound the trump of Truth in search of *Right*
Piercing the dense, dark clouds of Theologic-Night!

S.

Sept. 1893.

COMPETITIVE DESIGN FOR THE NEW CAPITOL BUILDING AT OLYMPIA, WASHINGTON.

THE *Pacific Builder* has the following to say in reference to the call for competitive designs for the new Capital building at Olympia, Washington, which we published in full last month.

Competitive designs are now called for from the architects of the country for the proposed new Capitol building for the State of Washington at Olympia. In the call issued it is stated that the architect whose design is accepted will be retained as the architect on the building, but the commission also reserves the right to reject any and all plans and designs. Provision is also made for a "consolation stipend" for the architect whose designs are given second, third and four places in the sums of $1,500, $1,000 and $500 respectively. From a statement made by one of the officials of the Capitol commission and published elsewhere in this issue it will be seen that the board expect, at the same time, that over one hundred competitive sets of plans will be submitted. Over four hundred contour maps of the site for the proposed building have already been applied for, it is said by architects throughout the country. The plans are to consist of four elevations, plan of each story, one sectional and one perspective drawing, and the building is to be modern throughout. To prepare creditable drawings for a building of this character would probably require the services of one man constantly for thirty days. No doubt many competitors will spend the greater part of a couple of months in preparing, altering and elaborating their designs. Estimating at one hundred designs submitted and thirty days for each design we see that the competition will represent three thousand days' work of one architect, or a period of nearly nine years including Sundays. Estimating the value of an architect's services at the rate of ten dollars per day, certainly not an unreasonable compensation for one capable of designing a building of this character, we find that the value of the actual work services to be rendered by the architects in such a competition is $30,000. To this amount must be added the necessary expenses of making the drawings, in material, etc., and as the majority of the competitors will consider it necessary to attend the meeting of the commissioners when the award is made to explain their drawings if called upon, a personal expense must be incurred which, all included, will probably not average less than fifty dollars each, which add $5,000 to the general bill, making a sum total of $35,000. For this great service from the architects of the country what is to be paid? They are conditionally promised $3,000 in cash. This is practically all, for the architect whose design is accepted, if any be so fortunate, so far from having earned anything in the competition shall only have demonstrated his fitness, in the opinion of the judges, to perform the work required and the matter of employment and pay for his services will still remain to be agreed upon. Beyond this cash consideration and the hope of employment there is but one incentive to induce architects to compete and that is the ambition to excel. To bring out the abilities and possibilities of the young architect especially such competitions may be considered opportunities. To accomplish this, however, the competition must be conducted with technical skill and the awards made on the honest, absolute merits of the drawings. Since therefore the architects of the country are expected to contribute over $30,000 in cash and services to this Capitol building it might be well to enquire what are the prospects for an honest and intelligent award. Who constitutes the Board of Capitol Commissioners of the State of Washington? Is it composed of architects, engineers or builders in whole or part? So far as we can ascertain not one member of the board has enjoyed the slightest technical education. Moreover, although explicit requests have been made of the Board to induce them to employ an expert to assist in adjudging the plans, they have persistently avoided anything calculated to favor the impression that they would do so. Here will be one hundred different sets of plans, each set composed of several drawings. It will be necessary for the judges to understand the exact relation which the different drawings of each set bear to one another. To understand the floor plans with relation to the elevations and sectional drawings and judge whether they are accurately and correctly represented. To pass upon the merits of the planning as well as to judge of the difficult problems of lighting, heating and ventilation. Then also to compare the different sets of plans one with another and to judge and weigh the relative points of merit to a nicety. Is it probable that five ordinary business men, however disinterested, will be found competent to pass upon these points? The possibility, we might say the probability, therefore, confronts the architects that the best design may not be selected by the commissioners. Moreover, as the terms of the "Notice to Architects" will show the proposition of rejecting all designs submitted has been fully considered. At Ellensburg, Wash., designs of the best architects in the country were rejected by the board of regents of the State Normal school and the job was given to a local mill-man. At Pulman the extensive building for the college was given to a contractor to plan. It is possible that the Governor and his Capitol Commission may not follow the policy adopted by the other boards in charge of building, appointed by him, even though he is known to have endorsed their actions. But how are the architects who are expected to contribute $30,000 in money and services in this competition to fore-know? They can only judge the future by the past. Relying on that past as a guide we should say that unless the Capitol commission gives timely assurance that the services of competent and reliable experts will be employed as judges in this competition it will be a matter of profound surprise if a design from a single able and prominent architect in the country will be found among the hundred or more which may be submitted in the competition.

HOW UNCLE SAM'S BUILDINGS ARE DESIGNED.

THE following extracts from a paper read by Jeremiah O'Rourke, Supervising Architect of the Treasury Department, to the World's Congress of Architects at Chicago, will give a good idea of the way our public buildings are designed, and the amount it costs to design them:

ORGANIZATION OF THE SUPERVISING ARCHITECT'S OFFICE.

At the beginning of the administration of President Franklin Pierce, in 1853, the Government owned twenty-three completed and occupied buildings, and appropriation had been made for fifteen new buildings. The construction of these buildings was intrusted to the Treasury Department, well nigh everything, except the amount of appropriation, being left to the discretion of the then Secretary of the Treasury, Mr. Guthrie of Kentucky, who was in full accord with the new movement. No method or system had been devised nor means provided for the performance of the duties. Architect A. B. Young had just satisfactorily completed the erection of the Boston Custom-house and, with a view to develop the growing branch, Mr. Guthrie tendered him, all he could, a $1,500 clerkship in his Department. Simultaneously, with a view to an efficient management, he obtained from the Secretary of war the detail of Captain A. H. Bowman of the United States Engineers, and placed him in charge of the construction of these buildings. Though Captain Bowman was nominally Mr. Young's superior, both acted for eight years as colleagues and in full harmony—a duarchy at the head of a bureau existing without authority of law, but strong as the offspring of necessity. Carefully compiled regulations for the design and construction and the repair and preservation of all public buildings under the Department was draughted, accepted by the Secretary, and promulgated. These rules were gradually perfected so as to form the foundation of the complicated, but strong and efficient organization of the Supervising Architect's Office as it exists to-day.

The extent of the business of the Supervising Architect's Office will be appreciated when it is stated that during the last fiscal year ending June 30, 1893, there was expended for sites, construction and repair of buildings $6,741,286.11, and that the contract obligations amounted at the end of the year to $2,834,308.02.

In the transaction of the business there are employed at the central office 145 persons (fifty of whom are females), and 180 persons as superintendents, clerks, foremen, etc., on the various buildings in course of erection throughout the country, from Alaska to Florida and from the Atlantic to the Pacific Ocean.

A large volume of administrative work is charged upon the office by reason of its facilities as a distinctive part of the machinery of the Treasury Department. Permanent and complete records are necessary, the details of the variety of work must be systematically executed in accordance with well considered rules, in order to maintain correct and harmonious business relations with the other executive offices of the Government.

The office force is organized in ten (10) divisions, with a chief at the head of each, all reporting direct to the Supervising Architect, or to his Assistant and Chief Clerk, who acts as Supervising Architect during his absence. These divisions are:

1. Engineering and Draughting Division.
2. Law and Contract Division.
3. Construction Division.
4. Computing Division.
5. Repairs and Preservation of Public Buildings Division.
6. Accounts Division.
7. Tracing Division.
8. Records and Files Division.
9. Copyists' Division.
10. Photograph Division.

The titles of the divisions indicate generally the character

and range of their duties, and but few explanations are required.

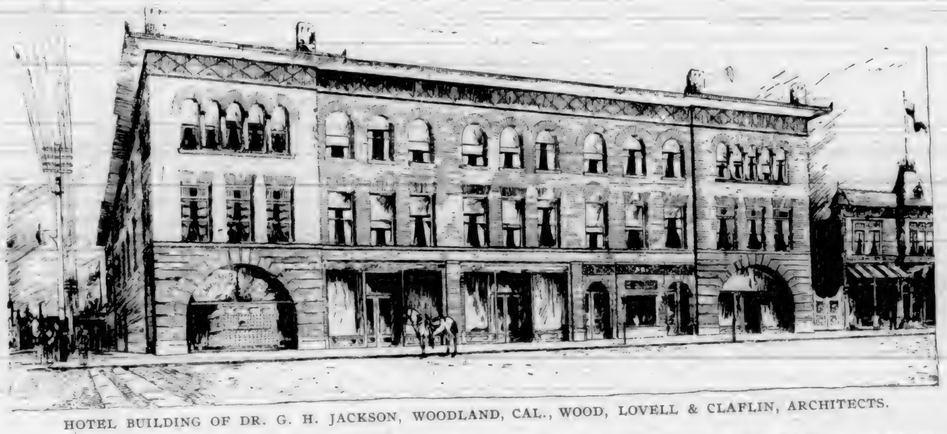
The Engineering and Drafting Division is charged with the making of all designs, plans and detail-drawings required for all the buildings erected, and with the correspondence relating thereto.

It usually employs the services of fifty (50) to sixty (60) expert draughtsmen, including specialists for steel and iron construction, heating and ventilating, and elevator and machinery work.

The draughtsmen are classified and arranged according to their special qualifications, so as to obtain the best results. The draughting-room, which is of large dimensions and well lighted, is supplied with all the best appliances required for a complete architectural and constructive-engineering office.

The salaries range from three to eight dollars per day. The office-hours are from nine to four, with time for lunch. Each draughtsman is allowed, in common with all the employees of the office, thirty days' vacation, with pay, and, in case of sickness, sixty days each year.

The other nine divisions work in harmony with the Draughting and Engineering Division, each through its chief reporting direct to the Supervising Architect, the whole forming probably the largest and best equipped architectural office in the United States, perhaps in the world.



HOTEL BUILDING OF DR. G. H. JACKSON, WOODLAND, CAL., WOOD, LOVELL & CLAFLIN, ARCHITECTS.

METHOD OF PROCEDURE IN PREPARING PLANS AND AWARDING CONTRACTS.

Before any money can be expended on a new public building, the Supervising Architect is required by law to make sketch-plans and estimates of cost, both of which must have the approval of the Secretary of the Treasury, the Postmaster-general and the Secretary of the Interior. The estimates of cost must be, in each case, within the limit of the appropriation made by Congress.

The approval having been obtained, the sketch-plans are returned to the Draughting Division for the preparation of scale working-drawings, which are made to show in full and minute detail all parts of the construction and finish of the building, both external and internal. These are passed through the Tracers' Division to the photographer for copying, and simultaneously to the Computers' Division for detail office-estimates of cost and advertisement for bids, thirty days being the usual time allowed to bidders.

An unusually large number of plans and copies of the plans and specifications of each building are required for circulation among prospective bidders, to whom, on application, they are sent by mail.

It is found that the number of scale-drawings required for each building ranges from thirty (30) to two hundred and twentg-five (225) sheets, and the average number of sets of scale-drawings required for estimates on each building is thirty (30) sets, exclusive of complete, full-sized working-drawings, which are always furnished after the contracts are awarded.

At the appointed time, the obtained proposals are publicly opened by the Supervising Architect, his assistant and chief clerk, and the chief of the Computing Division. A full record of the bids is kept and transmitted to the Secretary of the Treasury, with a recommendation to award the contract ot the lowest responsible bidder.

On the approval of the Secretary, the successful bidder is notified, the contracts and bonds (five sets) are prepared in the Law and Contract Division and transmitted to the contractor. The contract having been signed, bond executed and vouched for by one of the designated Government officials, is returned to the Department, examined and passed upon by the Soliciter of the Treasury, and, unless there is some irregularity, work is started.

The contract contains generally a clause stating the time agreed upon for completing the work, and a *per diem* forfeit for failure to complete within the specified time.

METHOD OF PROCEDURE IN THE ERECTION OF BUILDINGS.

On the award of the contract, a "Superintendent of Construction" is appointed, and, according to the size and importance of the building, he is allowed a clerk and one or more foremen and watchmen to assist him in the performance of his duties.

The soil under the foundation has generally been previously tested by excavation, boring or other reliable method, and unless unexpected impediments are encountered, the work progresses regularly, the "Superintendent of Construction" reporting by mail or telegraph to the Supervising Architect, monthly and whenever necessary, up to time of completion.

At intervals during erection and before final acceptance, each building is visited, examined, controlled and reported upon by "Inspectors of Public Buildings," all working under specific written instructions from the Supervising Architect's Office, and reporting thereto in writing and in detail up to the completion of the contracts.

Payments on account, based on quantities and value of the work actually incorporated into the building, are made monthly, retaining ten per centum of the estimated value until completion and final acceptance of the work.

It may be stated in conclusion, and in justice to the Supervising Architect's Office, that while it may be admitted that the work turned out by this office might, and doubtless will, be improved, still a just comparison and analysis would seem to indicate that, all things considered, it will compare favorably in design, arrangement, construction and cost with similar works erected by either States, municipalities or private enterprise.

It may be proper also to state, with reference to the amount paid by the Government for the professional services rendered by the Supervising Architect's Office, that the records of the office show that the amount paid for said services never exceeds five per cent on the cost of the buildings erected, although the usual proportion of such services are of a character which usually commands, in private practice, a much higher professional fee.

The Supervising Architect himself, for professional services which, in private practice, would easily net $100,000 a year, receives the munificent salary of $4,500, with strictly limited traveling expenses.

LACK OF BUSINESS ENTERPRISE.

THE Board of Manufacturers and Employers of California, have issued for distribution an able address by Henry L. Davis, their president, calling on all retailers to patronize California industries.

The *Herald of Trade* has the following in connection therewith, showing how these home-made goods should be brought to the attention of the people. Times have changed and so have business methods and to be successful one must keep abreast of progress of the times.

Let the Rip Van Winkles of trade go into a modern store and they will recognize progress. Stores better arranged, good kept more neatly and in better order; large capacious sample-rooms, with the samples so arranged as to be pleasing to the eye and handy for inspection, with other inprovements which mark the progressive merchant. Nor is this all. The man of success nowadays uses the trade journal, for in it he recognizes the medium that reaches hundreds of merchants each week. He also knows that a trade journal is closely scanned by progressive dealers, and therefore in it an attractive, catching advertisement, changed often in its make up, does more good than price-lists, circulars, or other makeshifts can possibly do. Continuous advertising in a catching way will draw trade. This is the history of every successful firm. Do the manufacturers of this city follow such a course? Then why do they complain of business passing by them? Take up Eastern trade journals and we find them full of attractive advertisements; with constant changes in their makeup. The more successful firms give steady employment to one person to get up their advertisements so they will be a novelty each week and cause readers to look for each number of the trade journal to see what will be the next new advertising scheme. And it has been found to pay.

But, aside from the advantage to advertisers directly, the sustaining of a trade journal should be a matter of pride, for there is no commercial city but boasts of trade organs, and our city should not be behind the age. This is the age of newspaper education. A person that does not keep abreast of the times by closely reading the daily press for current news is considered a back number, and a trader or person in any branch of trade who does not read his trade journal is left in the race for wealth. Not only does the successful business man read and digest everything published concerning his special branch of trade, but he gives attention to what is said regarding other branches. He also looks over the advertisments of competitors in the jobbing, importing or manufacturing business to see what they are offering for sale, or if in the retail business he scans the advertisements to see if there is any specialty offering which can be made a good advertising card, or else to see if there are any special drives by which he can secure bargains. These facts are so apparent to the wide-awake and progressive merchants that they do not require enlarging.

MAUSOLEUM, HOME OF PEACE CEMETERY, R. H. WHITE, ARCHITECT.

MEETING OF THE LADIES' COUNCIL.

THE late meeting of the Ladies' Council at the Metropolitan Temple is a move worthy of consideration. The question discussed is without doubt one of the most important with which we of the end of the nineteenth century have to grapple and deal with. The subject was handled in good shape by the speakers of the evening. The following resolution was adopted and deserves the serious consideration of our municipal authorities:

WHEREAS—Municipal sanitation is known to be an essential condition of civilized life and progress; and whereas the city of San Francisco is a reproach to our country and a blot on Western civilization in the criminal inferiority and deficiency of her sanitary condition, this condition menacing the lives of her citizens and retarding immigration and all material prosperity, be it

Resolved:—That we, citizens of San Francisco, in mass meeting assembled, hereby demand of our city government the absolute enforcement of existing sanitary laws and such further enactments as shall raise the standard of sanitation in San Francisco to an equality with the foremost cities of the world.

ANNUAL MEETING.

THE annual meeting of the stockholders of the California Architectural Publishing Company, will be held in the office of the company, 408 California street, San Francisco, Cal., on Tuesday the 7th day of November, 1893, at 1 P. M.

ILLUSTRATIONS

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

THE Oregonian building in Portland, Oregon, is by Reid Bros., architects of this city.

THE cottage illustrated in this number is by J. C. Newsom, architect, it has a foundation of klinker brick with a frame work of Oregon pine filled in with a gray cement and covered with cedar shingles.

THE ESCHENHEIMER TOWER.

BY MISS LANDIS.

IN Frankfort on the Main, where the Eschenheimer Landing and the Bockeimer Anlagen meet, stands the old and interesting Eschenheimer Tower. It is a part of the remains of the old fortifications of the city, built in the years from 1400 to 1428 and is forty-eight meters in height, with five small towers around the centre one and four corner towers.

On the tenth of June, 1874, lightning struck the weather signal (a flag,) tearing it down. The saying runs that a number nine was shot in the flag by Hans Winkelsee, a poacher, who saved his life and gained freedom in this way, through his skill. When the flag fell down in 1874, it was found that instead of nine holes, there were only six in the flag. The tower was renovated in 1874, but the beautiful ivy climbing its walls is several centuries old.

By a mistake of the draughtsman the illustration was printed the "Hamburg Tower."

TWO VIEWS—WHICH?

ON the one hand it is claimed by the fire extinguishing experts that English and in fact European apparatus for fire extinguishment are obsolete and old fashioned as compared with the modern inventions and general excellence of our American outfits and brigades, as evidenced by the recent walk-over which our crack Kansas City team had in competition with the teams of the United Kingdom at the competitive fire drill in England. On the other, it is learned that over there they do not bother so much about putting out fires, for they do not have many, and each is generally isolated, and even if it burns itself out in the building where it started, there is not much danger of its spreading to great proportions. Hence they can afford to be satisfied with rather inferior machines and much smaller fire departments, sustained at a very much less annual cost than ours. Here we do the reverse. We spend enormous sums annually for insurance and in keeping up finely disciplined fire departments, equipped with all the latest improved engines and apparatus. Now which is the best and most economical in the long run? We take desperate chances on fires and their extinguishment and save money in construction. It is not merely the frame structures that are dangerous, as the Boston, Chicago, Milwaukee and other great conflagrations easily show. A large part of our brick buildings are "Jerry built," and are mere shells concealing a mass of timber adjusted to create a most satisfactory bonfire. Of the two systems we must admit that we rather incline to the English, and it is only a matter of time how soon this view will be generally recognized. In fact, for the past two decades we have partially learned the lesson, and as the various modern stone, brick and tile structures are brought to the front, there is cheaper and better material, more scientific construction and more honest building resulting in greatly lessening the percentage of fire traps over the entire country.—*The Southern Architect.*

QUEER RESIDENCE IN ARIZONA.

ARIZONA is plentifully sprinkled with the ruins of strange habitations. Most of them are constructed of concrete or adobe, and the mystery about them is the identity of the people who designed them. How they could be built is not a matter of conjecture, as the materials are close at hand. But there is one ruin, still in good state of preservation, which is a mystery, no matter in what light it is considered. It is in the Huachuca mountains, not far from the military reservation, in a northeasterly direction. Nothing is known of its origin, and the wonderful part is the material of which it is constructed. It is about 200 miles from the ocean and surrounded on all sides by hills of sand and rocks covered with cacti. There is no water for miles except the excuses for rivers that run during the rainy season. There is not even the suggestion of water, and yet the house is built of seashells laid in a sort of cement. Where the shells were obtained is a mystery that may never be solved. It does not seem possible that the builder of the house would carry the material over hundreds of miles of desert when there were plenty of rocks near by that would answer the purpose just as well even if they were not so unique. The house is build in the shape of the straw huts of the Papago Indians and is about the same size. There is room inside for five or six persons, but at present nobody occupies it, except, perhaps, some prospector who uses it for a temporary shelter in cold weather. There are a dozen varieties of shells to be found in the walls, and one over the door is of extraordinary size. The age of the building will never be known, but there is little doubt that it is old as the oldest in the territory.—*The Builders' Gazette.*

NOTES & COMMENTS.

By an oversight in our last issue we failed to give due credit to the *Transactions of the Technical Society*, from which publication we took the article by Marsden Manson, on the healthfulness of California homes.

What the Sacramento *Record Union* thinks of the CALIFORNIA ARCHITECT—The *California Architect* for September (San Francisco) is a special number, giving very handsome full-page outline pictures of the Midwinter Fair buildings from the accepted designs of the architects. There is a very interesting paper also by Marsden Manson, C. E., on "California Homes—Are They as Healthful as They Should Be?" Other valuable papers appear also, making the number one of high value.

THE UNIFORM CONTRACT.

INDICATIONS from various sources point to the fact that the manner of adoption and recommendation of the use of the Uniform Contract by the American Institute of Architects and the National Association of Builders is not generally understood among either architects or builders. The architects are apparently the less well informed of the two, which is doubtless due to the fact that the use of the form has not been urged upon its members by the American Institute with the same persistence that has been displayed by the National Association of Builders.

A recent example of the lack of comprehension of the situation is indicated by the opinion of an architect practicing in a prominent New England city, who questioned the authenticity of the revised form of the Uniform Contract, and stated that the revision had rendered the form unfit for contract purposes." This case is a slightly exaggerated example of others of a similar character. All action with regard to the Uniform Contract has been taken by regularly appointed committees from the two organizations mentioned, acting in conjunction, with full power to create and amend a Uniform Contract, which should be adopted and recommended for use by the organizations in question. The first joint committee included representatives from the then existing Western Association of Architects, but this organization having become absorbed into the American Institute of Architects, the present sponsors for the contract are the American Institute and the National Association of Builders, the two representative bodies in the United States. It was deemed necessary that the joint committee should be given full power, for the reason that if each sub-committee were compelled to report back to its parent body before final action on the contract could be taken, the differences of opinion on the part of individual members of the two organizations would occasion such lengthy discussion, and so many amendments and recommendations, that united action would have been practically impossible. Each organization, therefore, selected a committee composed of its most able members, to which was delegated full power to prepare a Uniform Contract for adoption and to amend the same whenever amendment should be considered necessary. The form originally prepared by the first joint committee and adopted by the two parent bodies existed without revision for about five years, none of the changes to the form submitted during that time being considered sufficiently important to warrant a revision. In October, 1892, the joint committee met for the purpose of considering all the suggestions for the improvement of the form which had been presented since its adoption, and so make such changes in it as experience in its use indicated as advisable. The result of this meeting was a careful and thorough revision of the form which has made its wording more simple and direct; shorter by five hundred words; and generally improved it over the original form. One feature of the new form which has caused some comment is that the words "contractor" and "owner" are printed in the singular without space for the addition of the plural; but the form definitely states that whatever is the style of name of the contractor or owner, whether an individual, a company, or neuter, for the purposes of the contract they shall be termed "contractor" or "owner". In printing the word "architects" in the plural, it was deemed easier to draw a pen through the s where the singular was needed than to write the letter where the plural was required.

The Uniform Contract as revised by the joint committee was adopted and recommended for use by the National Association of Builders at its last convention, as was stated in these columns at the time; and the official action of the American Institute of Architects is indicated by the adoption at its recent convention, of the report of its Committee on Uniform Contract, which is as follows:

"Your Committee on Uniform Contract begs leave to report that the last meeting of the joint committee of the American Institute of Architects and of the National Association of Builders was held in the office of Messrs. Adler & Sullivan (Chicago), October 19, 1892.

"At that time numerous communications were read in which suggestions were made as to changes in the form. In accordance therewith several important changes were made. The form was considerably shortened—about 500 words having been eliminated. The paragraphs were rearranged, grouping the requirements of either party of themselves, and in both cases the singular number being substituted for the plural. Attention was called to the omission of the clause referring to the penalty for non-completion of work at the specified time. So many conflicting views were presented regarding this portion of the form that it was deemed best to omit it, leaving it to the judgment of the parties in interest to draft such a clause as they should agree upon.

"Your committee suggests that, for the information of the institute, the secretary be requested to cause to be printed such information as will be of value, in circular form, and mail from time to time to each member. This circular to contain information not only as to the revision of the form, but the name of publishers, price, etc."—*Carpentry and Building*.

FROM THE THEATRE OF MONTE CARLO, CHAS. GARNIER, ARCHITECT.

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.

GEO. H. SANDERS, Pres. W. J. CUTHBERTSON, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.

C. E. GRUNSKY, Pres. CHARLES D. MARX, Vice-Pres.
OTTO VON GELDERN, Sec. GEO. F. SCHILD, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.

GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

MUNICIPAL WISDOM.

AN amusing account of the experience of a town in Northern Ontario is given by the *Canadian Architect*. It seems that the municipal fathers, having been intrusted with the arrangements for erecting a town hall to cost about $20,000, began their deliberations by the sage resolution not to employ an architect. Their first step was to call on one of their local carpenters and ask him to prepare rough designs. After these were procured they finally instructed one of their builders to prepare the plans for the building. These on examination proved far from having that architectural effect which was expected on the part of the people or the council and were rejected, when, as a last step, an architect was called, the council and the people having learned by the course of experience through which they had gone that an architect was necessary if their $20,000 town hall was to be either suitable to their wants or presentable in appearance.

FRENCH HOSPITAL CONTRACTS.

CONTRACTS for the construction of the new French Hospital were filed in the Recorder's office. They represent a contemplated expenditure of over $131,000. The amount of the various contracts is as followers: Gray Bros., concrete work, $25,885; Warrell & Miller, brick work, $47,539; Alexander L. Campbell, carpenter work, $45,500; S. Ickelheimer & Bros., plumbing, $9,110; J. F. Sullivan, painting, $3,675; Lat. E. Allen, electric fittings, $375.

The new hospital is to be erected on block 279 of outside lands, bounded by Fifth, Sixth and Point Lobos avenues and by A street.

TENDERS TO BE RECEIVED.

Treasury Department, Office Supervising Architect, Washington, D.C., September, 28th, 1893. Sealed proposals will be received at this office until 2 o'clock P. M. on the 2d day of November, 1893, and opened immediately thereafter, for all the labor and materials required for the interior finish, plumbing and gas piping for the U. S. Post Office, etc., building at San Jose, California, in accordance with drawings and specification, copies of which may be had on application at this office or the office of the Superintendent at San Jose, California. No convict labor nor any product of convict labor will be allowed in this work.

Each bid must be accompanied by a certified check for a sum not less than 2 per cent. of the amount of the proposal. The right is reserved to reject any or all bids and to waive any defect or informality in any bid, should it be deemed in the interest of the Government to do so. All proposals received after the time stated will be returned to the bidders. Proposals must be enclosed in envelopes sealed and marked, "Proposal for Interior Finish, Plumbing and Gas Piping for the U. S. Post Office, etc., building, at San Jose, California," and addressed to

Jeremiah O'Rourke,
Supervising Architect.

BOOKS & PERIODICALS

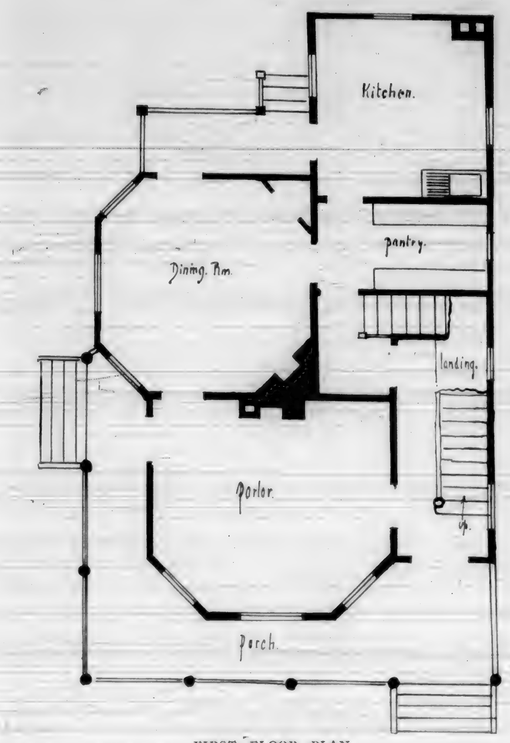
NOTES ON BUILDING CONSTRUCTION arranged to meet the requirements of the syllabus of the science and art department of the committee of Council on Education, South Kensington, Part IV. Calculations for dwelling structures, Course for Honours. London, Longmans, Green & Co., New York, 15 East 16th street. For sale by Osborn & Alexander, 401 Market street. Price $4.00.

GOTHIC ARCHITECTURE by Edward Corroyer, architect to the French Government and Inspector of Diocessan Edifices. Edited by Walter Armstrong with two hundred and thirty-six illustrations. This work as we learn by the preface was translated under the supervision of the editor by Miss Florence Simmond, and presents a value as a picture of Gothic development, even if the reader does not agree with all Mons. Corroyer views and claims. Published in New York by Macmillan & Co.; for sale by Osborn & Alexander, 401 Market street. Price $2.00.

ELECTRIC LIGHTING SPECIFICATIONS for the use of Engineers and Architects by E. A. Merrill, published by W. J. Johnston, New York, for sale by Osborn & Alexander, price $1.50.

In this age of electricity the architect cannot be to careful to inform himself thoroughly, as to the requirements of a safe plant, when introducing electric lights in buildings. This book certainly will be of use for that purpose.

ARCHITECTURAL SKETCHES by F. W. Beall. The introduction of the author may furnish a hint to other architects who desire to advertise in a pleasing and picturesque manner, a number of miscellaneous examples taken from the author's practice are given, with a slight sketch and suggestions between the illustrations of what changes might be made, the cost, etc. Mr. Beall is an architect in the city of New York, office 318 Broadway.



FIRST FLOOR PLAN.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

PROPOSALS FOR BIDS FOR WORK.—Where, by statute, public officers are required to advertise for bids for the performance of certain public work, and to give the contract to the lowest bidder, the person whose bid is lowest is entitled to the contract, and can enforce his rights by mandamus, or by action against the officers for specific performance, or perhaps for damages. This is upon the principle that a tender and acceptance constitute an agreement, and it was held, that where bids were called for, for the performance of certain work according to certain specifications, the work to be given to the lowest bidder, that the lowest bidder for the work, even though his bid was informal, amounted to a tender on his part, and an acceptance on the part of the owner, which made a complete and binding contract, and its provisions were enforced against him.

And though nothing is said in the call for bids as to whether the work shall be given to the lowest bidder, yet, if such is the custom and common understanding, the lowest bidder has a right to treat his bid as accepted, unless it is expressly rejected. But if by the terms of the call for bids a written contract is to be entered into and signed by the parties, after acceptance, the contract is not complete until this is done, and it seems that either party may withdraw before this is done. In fact, if anything is left open to be done before the agreement is complete, either party may recede. In order to make the bid and acceptance a complete contract, nothing must be left to be done by the parties. When a call for a bid for work refers to a certain plan and specification, the plans and specifications are treated as incorporated into, and forming a part of the contract, as well as all other matters referred to in the call. And where compensation is to be made out of a particular fund, no claim can be made except against that fund.

When, however, the law does not require the work to be given to the lowest bidder, and the call for bids does not state that the work will be so given, or when any discretion is vested in the contracting board, the lowest bidder cannot enforce his claim. The same is true in the case of an individual advertising for bids for the doing of certain work, unless he expressly states in the call that the work shall be given to the lowest bidder, or there is some custom regulating the matter, he is at liberty to accept any bid which he deems most advantageous, whether it is the lowest or not. 458.

RULE WHEN THE EMPLOYER OWES A DUTY TO SERVANTS OF CONTRACTOR.—Although a contractee is not in general liable to the employees of the contractor for injuries resulting to them while engaged in his work under the control of such contractors, yet if the work is done on his premises he is bound by the same legal obligation that exists as between him and his immediate servants, to keep them in a suitable and safe condition, and is liable to any of the servants of such contractors for injuries resulting to them from defects therein, not under a contract obligation, but arising from the duty he owes to each of the employees, arising out of his obligation to provide such appliances, and this duty extends to keeping the premises upon which the servants of the contractor are at work, in a reasonably safe condition, whether the contract provides therefore or not. 151.

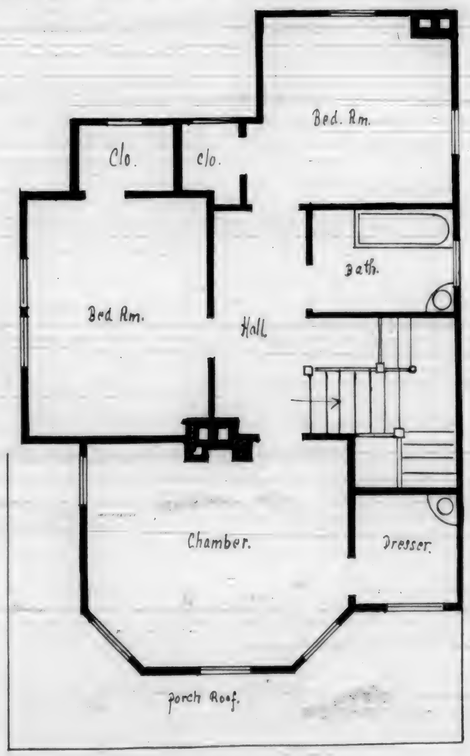
SUBSEQUENT ACTION FOR DAMAGES BY OWNER.—In an action by contractors to enforce a mechanic's lien, the owner is not bound to plead and prove damages sustained by their failure to comply with the contract, and a decree therein is no bar to a subsequent action against them to recover such damages.

Dewsnap v. Davidson, Supreme Court of R. I. 26 At. Rep. 902. 50.

ENTRY OF ADJOINING OWNER TO PRESERVE WALL.—A landlord is not liable to the tenant for damages to the lease-hold by a contractor who entered the premises to preserve the walls while excavating on the adjoining lot, merely because the landlord gave the contractor license to so enter, as he was required to do by the statute which requires the adjoining lot owner to perserve the party or other wall when he desires to excavate to the depth of ten feet below the curb.—McKenzie v. Hatton, Supreme Court of N. Y. 24 N. Y. Supp. 88 84.

AGREEMENT TO PAY SUBCONTRACTORS.—An oral promise by the owner of a building, to pay subcontractors made while the latter are working for the contractors, on condition that they will release their lien, which they do, imposes no legal liability on the part of the owner to such subcontractors, since such agreement is a promise to answer for the debt of another and is within the statute of frauds.

Hutton Bros. v. Gordon, Rockland County Court, 23 N. Y. Supp. 770. 63.



SECOND FLOOR PLAN.

THE MINIMUM SIZE OF PIPE SEWERS.

LONG before the construction of the Memphis sewers the question of minimum size for small public pipe sewers was discussed in England. On account of the frequency of stoppages the English custom has been, for at least 15 years, to fix the minimum diameter at 9 inches. In Baldwin Latham's work on "Sanitary Engineering," second edition, 1878, there will be found some information on this subject. The author, in relating the experience gained at Croydon, with about 19 miles of pipe sewers ranging from 4 inches to 18 inches in diameter, states that "between the 27th of March, 1852, and the 28th of November, 1853, a period of 20 months, 60 stoppages took place in the 4-inch sewers, 34 stoppages in the 6-in sewers, one stoppage in the 8-inch sewers, one stoppage in the 9-inch sewers, one stoppage in the 12-inch sewers, one stoppage in the 15-inch sewers, and two stoppages in the 18-inch sewers. Calculated by the length of sewers of each size in operation in Croydon at the time, the proportion of stoppages to the length of each size of sewer was as follows:

4-inch	sewers,	one	in	106	feet.
6 "	"	"	"	1,807	"
8 "	"	"	"	6,435	"
9 "	"	"	"	14,100	"
12 "	"	"	"	12,117	"
15 "	"	"	"	9,518	"
18 "	"	"	"	758	"

The author further states that "the number of stoppages in the 4-inch sewers would have probably been greater, but some of these very small sewers were taken up in the period and replaced by other of larger size. All the stoppages in the 12-inch, 15-inch, and 18-inch pipe sewers occurred from the insufficiency of the strength of the pipes, and their subsequent collapse in the work. The stoppages in the smaller sewers arose from accumulations of such matters as usually enter sewers, such as paper, hair, etc. To such an extent was the small-pipe system carried in these early works at Croyden that in one district a sewer 4-inches diameter was used for the drainage of 16 houses, one 6 inches diameter for the drainage of 137 houses."

Mr. Latham explains these stoppages by the fact that the sewers were partly laid in the subsoil water and imperfectly jointed with clay. Yet similar experience under better conditions and with cement joints has caused most English engineers to adopt 9 inches as the minimum size for public sewers.

It will be noticed what a great difference there is between the 6-inch and 9-inch pipes in this respect.

Your correspondent says: "It may readily be conceded that there is no serious practical reason, aside from cost, why 8-inch pipes may not be used." They will be kept in substantially as good condition as to cleanliness as 6-inch pipe will, and they will of course, perform the same service. They cost for purchase and laying about 50 per cent more."

It is gratifying to read of this "concession," in view of the author's contrary opinion, expressed some years ago; but the implication in his present letter, that while 8-inch pipes are conceded to be as good as 6-inch pipes from a sanitary point of view, that they are unnecessarily large and costly should, I think, still be disputed. The "50 per cent" of additional cost mentioned by him refers to the materials and labor of laying, and really amounts to only from 7 to 9 cents per running foot of sewer—not a serious matter. This additional cost is less than the usual difference between the bids of contractors for building 8-inch pipe sewers; the main cost being for the excavation and the labor of laying, which is practically the same whether the pipes are 6 or 8 inches in diameter. We should ask ourselves whether an 8-inch pipe is worth that additional small cost. Practical engineers generally say yes. They derive this conclusion not from any theoretical argument, but from actual experience for a long time under a variety of conditions. There is no doubt that 6-inch pipes are amply large to carry the ordinary sewage from many blocks of houses. Your correspondent says: "The 6-inch pipes of Memphis * * * never run half full, even in the closely built parts of the city," but, it might be added, more than 100 stoppages per annum have occurred in them. If nothing but sewage entered, this size would be more than sufficient as a minimum; but we have other matter to contend with which can and does enter through the water-closet traps. A 4-inch trap will pass sticks and other solid matter of a length greater than 6 inches, but rarely greater than 8 inches. When, therefore, a 6-inch pipe has an imperfect or projecting joint, causing such substances to be caught by it, there is a possibility of their assuming such a position across the section that they will catch and hold back paper and other matter which thereby obstructs the flow and facilitates further deposits. In an 8-inch pipe these substances are much less likely to assume such a position, because they are seldom if ever more than 8-inches long and able to be turned over completely during a flush, and thus pass on down the sewer. Herein lies, I think, the main reason why 8-inch pipes, when used as minimum sizes, are so much less frequently obstructed than the smaller ones. The reason given by your correspondent that 8-inch pipes take a longer time to accumulate deposits to the point of obstruction, does not seem to be the true one, for the obstructions are generally found to be formed by a nucleus at a definite point, rather than by a deposit along the line of the sewer excepting where they are caused by a faulty continuation or slope (the size having nothing to do with the formation of deposits), or where the pipes are not regularly or sufficiently flushed.

There is another advantage to be gained in using a diameter of 8 inches as a minimum size. With the same slope it allows the sewage to assume a great velocity during the flushing, and therefore to more effectually scour and clean the pipe. The difference of velocity between the ordinary flow in 6-inch and 8-inch pipes can hardly be noticed, but there is a substantial difference, namely, about 15 per cent in favor of 8-inch pipes when they are made to run at least half full in times of flushing.

While the above results furnish some reasons for the general preference of 8-inch, and in England of 9-inch pipes, as a minimum size for public sewers, we are often justified in using smaller sizes. On steep slopes, for instance, the high velocities are sufficient to minimize the occurence of obstructions by loosening deposits or changing the position of sticks, etc., that have found lodgment. Therefore 6-inch pipes are more successfully used under such conditions. House drains, feeding the public sewers, can often be safely made even 4 inches in diameter if the usual interior projections at the joints of stone-ware pipes are avoided; for instances, by the use of iron pipe. For the benefit of the public pipe sewers it is desirable to reduce the diameter of house pipes to 6 inches or less, so that the result of carelessness and improper use of the sewerage system will be felt and remedied by the parties committing the act instead of by the public at large.—*Rudolph Hering in The Engineering Record.*

CLEANLINESS BRINGS HEALTH.

RECENTLY we read a very entertaining and instructive article from the New York *Times*, in which was described the method of cleaning the city of Paris, France. In that beautiful city they do not rely upon the sweeping machine and dump cart for cleansing the city, but they flush the gutters two or three times a day, and do it so thoroughly that the refuse of the streets and avenues is carried into the sewers, and borne away beyond the limits of the city. It is this care of the city that has given Paris such a reputation for cleanliness, beauty and health. It costs the people of that city, on an average, seventy-five cents a year for each inhabitant, to keep the city clean. This in the aggregate, amounts to a large sum, but it is not as much for each one as a bottle of patent medicine would cost. It is not one-half the sum required to pay for one visit of a physician. Paris gains in the health of its citizens many times the cost of cleaning the city.

If the great cities of America would institute similar thorough methods in cleansing their streets and avenues, the average health of our country would be greatly improved. The life of our citizens would be prolonged, and the comforts of life multiplied and intensified. A wise policy for a city administration would be to cleanse the city at any cost. It is just as essential that we should have clean homes and streets, as it is that we should have clean food and clean water to drink. In fact, without clean homes and clean streets, it is impossible to have clean food, pure air, or pure water.

No better time was ever known for the inauguration of a policy of cleanliness than at the present. The recent ravages of cholera in Europe, and the danger of its entry into this country, have awakened people to the importance of providing against it. They would be willing to assist in carrying out an intelligent cleansing policy, by reason of their anxiety to ward off the disease and turn aside the messenger of death.

It is to be regretted that an appeal to people in behalf of the common decency of cleanliness is urgently necessary in the closing years of the nineteenth century. Cholera is but one of a great many diseases that dirt and filth and neglect engender. It comes but once or twice in a century, while no city in America is free for one day in the year, from many enteric diseases that carry off many thousands from among our people. Looked at from the sanitarian's point of view, cleanliness is not only next to godliness, but it is godliness; for whatever gives health to the body, gives vigor of intellect and soul, and he who is vigorous in his mind and heart, worships better, lives better, and acts nobler. Let us therefore be clean.—*Sel.*

BUSINESS MOSAICS.

Have you a Burglar Alarm upon your safe? If not call upon C. F. A. Sturts, 126 Kearny street and you will be induced to get one for your safe or vault, but at the same time you will probably be inclined to purchase one for your dwelling house.

Miss Hosmer's statue of Apollo was on a pedestal in a corner when an old lady, Mrs. Raggles by name, paused before it. Finally she exclaimed:

"So that's Apoller, is it? She was assured that it was. "Supposed to be the handsomest man in the world, you say?" "Yet." "Wal, I've seen Apoller an' I've seen Raggles, an' I say, give me Raggles!"

Typewriting—If you want typewriting that is typewriting and looks like print, that does not require to be revised and scratched until you wish the typewriter had not been invented, go to room 45, 6th floor of the Mills building where you will find Misses Wilson & Kelly, telephone 5661.

Greek and Roman doors always open outward, and when a man was passing out of a house he knocked on the door so as not to open in the face of a passer-by.

Now that Winter is approaching and the cold weather is coming on we take pleasure in calling the attention of our readers to the Steam, Hot Water and Air Heaters, George H. Tay & Co., 610-620 Battery street, San Francisco. This firm furnishes estimates for heating public buildings and private residences, and will guarantee perfect heating, with unequalled economy of fuel.

Tramp—"Couldn't you give me a few cents ma'am?" WOMAN—"What would you do with it? Buy whisky I suppose." TRAMP—"No, ma'am, I'am collecting money for the Duke of Veragua."—*Judge.*

San Francisco Novelty and Plating works corner of First and Mission streets, manufacturers of artistic metal work. How much the appearence of a bank or office is improved by the judicious use of this style of work may be proved by a visit to any of the various institutions that have of late adapted this style of finish—which adds not only to the looks, but also to the safety and convenience of doing business in such surroundings.

When lumber is in so much demand for the Midwinter Fair we do not know that the San Francisco Lumber Company will thank us for calling attention to their various lumber yards in this city, but to solve any doubt on this point, if you want any lumber call upon J. N. Curtis, Manager, NW corner Pine and Montgomery street.

Cool-Headed citizen—"What are you running for? The dog is going in the opposite direction. Fleeing Citizen (bareheaded and frantic)—"A policeman is shooting at it."—*Chicago Tribune.*

Fitzgerald Prepared Wall Plaster is every day becoming more in demand as its merits become more fully known. The Pacific Patent Plaster Co. will have their hands full to supply orders, 216 Bush street, room 90.

Bacon—"How do you find business?" Egbers—"Advertise for it."—*Yonkers Statesmen.*

Those in want of architectural terra-cotta should call upon A. Steiger Sons, 320 Sansome street, room 3. Their factory is in San Jose, Cal., where every thing in this line from hollow tile to common flower pots can be found; the open fire-place with colored brick will be found very inviting some chilly morning—be in time and order before you regret that you are too late.

Hobbs (to friend at Stuffin's quick lunch)—"I say, Nobbs, how's business?" NOBBS—"Great! Never saw such a rush. No time to sleep, and way behind on meals. That was day before yesterday's lunch I just finished."—*Life.*

How often do we hear the remark "Oh, but it costs too much too use gas for cooking" this is a great mistake. If you want to be convinced of the fact go to the San Francisco Gas Light Gas Stove department, 226 Post street, and examine their stock of gas cooking and heating stoves, gas ranges and open fires. It saves trouble with dust and ashes, improves your temper and makes cooking a pleasure to the housewife at a less cost than the use of coal.

CITY BUILDING NEWS.

Broadway near Buchanan. Three-story frame addition; owner, Lizzie I. Hemple; architects, B. McDougall & Son; contractors, P. J. & M. Brennan; signed, Oct. 4; filed, Oct. 5; cost $4,195.

Bush near Larkin. All construction work above the ground floor; owners, Olympic Salt Water Co.; architect, D. Ernest Melliss; contractor, Jeo. H. Walker; signed, Sept. 18; filed, Sept. 23; cost $29,464.

California near 2d Ave. To build; owner, Chas. Kennedy; architect, Jno. B. Wuersching; contractor, Thomas A. Douglass; signed, Sept. 13; filed, Sept. 14; cost $1885.

California and Jones. Granite work; owner, Geo. Whittell; architects, Coxhead & Coxhead; contractor, Alex. McLennon; signed, Sept. 15; filed, Sept. 19; cost $3,000.

California and Jones. Alterations and additions; owner, Geo. S. Fife; architect, Clinton Day; contractor, John T. Grant; signed, Oct. 3; filed, Oct. 4; cost $2,555.

California near Scott. All excavating, concrete work, etc.; owner, N. Cousin; architect, Wm. Mooser; contractor, R. P. Sanches; signed, Oct. 11; filed, Oct; 11; cost $4,000.

Capp and Adair. Three-story frame except plumbing and painting; owner, Frances Horn; architect, F. P. Robin; contractor, J. H. Pauls; signed, Sept. 25; filed, Sept. 26; cost $4,838.

Clara bet. 3d and 4th. Alterations; owner, L. D. McCarthy; architect, H. D. Mitchell; contractor, L. N. Fletcher; signed, Sept. 15; filed, Sept. 16; cost $1,400.

Clara near Rich. Three-story and basement; owner, T. D. McCarthy; architect, H. D. Mitchell; contractor, L. N. Fletcher; signed, Sept. 30; filed, Oct. 3; cost $3,340.

D and 8th Ave. To build; owner, F. A. Freese; architect, C. M. Rousseau; contractor, L. B. Schmid; signed, Sept. 18; filed, Sept. 19; cost $1,950.

D and 8th Ave. To build except plumbing, tinning and gas fitting; owner, George Fisher; architect, Chas. M. Rousseau; contractor, Chas. P. Ralston; signed, Sept. 12; filed, Sept. 13; cost $800.

Dearborn Place near 17th. To build; owner, Julius Tammeger; contractor, Jno. H. Pauls; signed, Sept. 23; filed, Sept. 27; cost $4,400.

Dorland near Sanchez. To build; owner, J. H. Belser; contractors, J. T. Lorenzen and E. G. Fevrier; signed, Oct. 9; filed, Oct. 10; cost $4,190.

Dupont bet. Vallejo and Green. Repairing and alterations; owner, Daniel Seales; architects, Townsend & Wyneken; contractor, F. W. Kern; signed, Oct. 5; filed, Oct. 7; cost $2,265.

Fell near Steiner. To build; owner, Thos. F. Murray; architect, W. H. Lillie; contractors, White Bros.; signed, Sept. 12; filed, Sept. 13; cost $3,799.50.

Filbert and Scott. To build; owner, Carlo Casassa; architect, Wm. Mooser; contractors, G. B. Cavaglis & L. Cnueo; signed, Sept. 5; filed, Sep, 21; cost $1,700.

Geary and Grant Ave. Painting and decorating; owners, Davis Bros.; contractor, W. G. Roch; signed, Oct. 5; filed, Oct. 10; cost $2,350.

Geary and Grant Ave. Alterations and repairs; owners, Davis Bros.; contractor, Andrew McElroy; signed, Oct. 5; filed, Oct. 6; cost $6,100.

Geary and Grant Ave. Alterations; owners, Davis Bros. contractor, Jas. E. Britt; signed, Oct. 5; filed, Oct. 7; cost $1,700.

Golden Gate Park Midwinter Fair Grounds. Mechanical Arts building, owner, Executive Committee Midwinter Fair; architect, Edward R. Swain; contractor, R. P. Haribut; signed, Sept. 20; filed, Sept. 21; cost $68,973.

Golden Gate Park. Manufactures and Liberal Arts building; owners, Executive Committee Midwinter Fair; architect, A. Page Brown; contractors, Smilie Bros.; signed, Sept. 19; filed, Sept. 21; cost $107,360.

Golden Gate Park. Horticultural and Agricultural building; owner, Executive Committee Midwinter Fair; architect, Samuel Newsom; contractor, J. W. Wissinger; signed, Sept. 22; filed, Sept. 23; cost $54,000.

Golden Gate Park. Midwinter Fair Grounds Art building; owner, Executive Committee California Midwinter Fair; architect, C. C. McDougal; contractors, Worrell & Miller; signed, Sept. 27; filed, Sept. 28; cost $54,890.

Gough and Eddy. Art glass in all windows except basement; owner, St. Pauls German Evangelical Lutheran Church; architect, Julius Krafft; contractors, California Art Glass Bending and Cutting works; signed, Sept. 12; filed, Sept. 16; cost $1,200.

Great Highway near B. Construction of Superstructures of pumping station all work above grade line of lot; owners, Olympic Salt Water Co.; architect, D. Ernest Melliss; contractor, Geo. H. Walker; signed, Sept. 18; filed, Sept. 23; cost $8,895.

Hayes near Devisadero. To build; owner, Isadore Fox; contractor, T. C. Cochrane; signed, Sept. 11; filed, Sept. 12; cost $5,700.

Hayes and Lyon. All work except electric work, tinning, plumbing and painting; owner, Ivan V. Yadich; architect, T. J. Welsh; contractor, James E. Mooney; signed, Sept. 26; filed, Sept. 26; cost $8,210.

Hampshire near 20th. Carpenter work, brick work, painting, plumbing, plastering, etc.; owner, H. Steinhagen; contractor, A. Klahn; signed, Sept. 15; filed, Sept. 16; cost $2,320.

Hyde and Washington. All work to build; owner, Annie Le Guevee, Guardian of Florence Le Guevee and minors; architect, Edward R. Swain; contractors, F. W. Kreling & Sons; signed, Sept. 28; filed, Sept. 28; cost $8,250.

Jefferson near Baker. Grading and sewering building, etc.; owner, Mrs. Emma Haferegger; architect, H. D. Mitchell; contractor, John Miron; signed, Sept. 19; filed, Sept. 20; cost $3,252.

Julius near Whiting. To build; owner, Mrs. Mary Malloy; architect, B. I. Clinch; contractors, J. F. Hefferman and Antonia Massa; signed, Sept. 7; filed, Sept. 12; cost $1,500.

Laurel Hill Cemetery. Two-story frame and brick office; owner, Laurel Hill Cemetery Association; architects, Percy & Hamilton; contractor, F. W. Kern; signed, Sept. 20; filed, Sept. 27; cost $13,068.

Lapidge and 18th. Three-story frame; owners, Mission Turn Verein; architects, Martens & Coffey; contractor, F. Klatt; signed, Oct. 6; filed, Oct. 6; cost $7,340.

Main near Mission. All work for factory and warehouse; owner, Estate of I. B. Pissis; architects, Pissis & Moore; contractors, Richardson & Gale; signed, Sept. 29; filed, Sept. 30; cost $9,600.

McAllister near Jones. Alteration and additions; owners, Katherine Adam & Eliza Kibbe; architect, Julius E. Kraft; contractor, S. H. Kent; signed, Sept. 15; filed, Oct. 4; cost $8,000.

McAllister near Jones. Brickwork and patent chimneys; owners, K. Adams & Eliza Kibbe; architect, Julus E. Kraft; signed, Sept. 5; filed, Oct. 4; cost $5,500.

McAllister near Jones. Lathing and plastering; owners, Katherine Adams & Eliza Kibbe; architect, J. E. Kraft; contractor, T. Murphy; signed, Sept. 15; filed, Oct. 4; cost $2,500.

McAllister near Jones. Plumbing, etc,; owners, Katherine Adams and Eliza Kibbe; architect, J. E. Kraft; contractor, Jos. E. Britt; signed, Sept. 15; filed, Oct. 4; cost $2,483.

Minerva near Plymouth. Excavating, etc., and all work for building; owner, Edward Nessier; contractors, Bates & Deuel; signed, Sept. 18; filed, Sept. 22; cost $1420.

Ninth and Clementina. Lathing and plastering three-story frame with brick foundation; owner, Executors of Estate of John Frothingham; architect, Julius E. Krafft; contractor, A. Hennie; signed, Sept. 23; filed, Sept. 25; cost $1,130.

Oak near Devisadero. Alterations and additions; owner, Lilly Schlessinger; contractors, B. McDougall & Son; contractors, Peterson & Olson; signed, Oct. 7; filed, Oct. 9, cost $4,425.

Page near Webster. Building except brick work; owner, E. A. Hildebrand; architects, Martens & Coffey; contractor, Jos. Bucher; signed, Sept. 26; filed, Sept. 27; cost $3,800.

Pacific and Central Ave. To build; owner, C. E. Brown; contractor, Philip Rive; signed, Oct. 5; filed, Oct. 6; cost $3,575.

Post near Powell. Iron work and illuminating tiles; owner, W. T. Coleman; architects, Pissis & Moore; contractors, O'Connell & Lewis; signed, Sept. 21; filed, Oct. 5; cost $1,450.

Post and Levenworth. Excavating, concrete, etc.; owners, S. F. Verein Assoc.; architects, Salfield & Kohlburg; contractors, Gray Bros.; signed, Oct. 11; filed, Oct. 11; cost $2,100.

Powell near Jackson. To build; owners, F. A. and J. Cavagnaro; architects, Henrikson & Mahoney; contractor, Robert Currie; signed, Oct. 6; filed, Oct. 6; cost $1,825.

Point Lobos Ave. near Collens. To build; owner, Honora Ratledge; architect, M. J. Welsh; contractors, Douglass & O'Conner; signed, Sept. 25; filed, Sept. 27; cost $2,400.

Pierce near Waller. To build; owner, J. C. Neilsen; architects, Kenitzer & Barth; contractor, J. W. Smith; signed, Sept. 12; filed, Sept. 13; cost $2,975.

Sacramento near Drumm. To build brick structure; owner, Henry Pierce; architect, Clinton Day; contractor, J. H. Wilson; signed, Oct. 6; filed, Oct. 10; cost $20,460.

Second street. Foundation to concrete lining of tide water tunnel; owner, Edison Light and Power Co.; architect, T. H. MacDonald; contractors, Healy, Tibbets & Co.; signed, Sept. 30; signed, Sept. 30; cost $6,270.

Second street. Pile foundation; owners, Edison Light and Power Co.; architect, T. H. MacDonald; contractors, Healy. Tibbets & Co.; signed, Sept. 30.; filed, Sept. 30; cost $5,270.

ALAMEDA COUNTY.

Alameda Land Co. Removing 4,000 yards of earth owner, Alameda Land Co., engineer, Geo. L. Nusbaumer; contractor, E. J. Bates; signed, Sept. 28; filed; Sept. 30; cost $500.

Central Ave. and Webster. Brick work, carpenter work, etc.; owner, Quincy Chase; architect, J. B. Matheson; contractors, Concannon & Shea; signed, Sept. 8; filed, Sept. 12; cost $2,320.

Daly Scenic Park Tract, Berkeley. Frame building; owner, Bete Theta Assoc.; contractor, M. Gallagher and M. F. Milburn; signed, Sept. 12; filed, Sept. 14; cost $7,910.

Daly Scenic Park Tract, lot 15, block 11. Two-story frame; owner, M. Carpenter; contractor, Fred Estey, signed, Sept. 16; filed, Sept. 19; cost $2,936.

Fasking Park. Excavating, brick, carpenter, plumbing, etc., on church; owner, First Unitarian Society of Alameda; architect, W. J. Mathews; contractor, H. E. Jones; signed, Sept. 22; filed, Sept. 30; cost $8,430.

Hayes street, San Leandro. Six-room cottage; owner, Mrs. L. Ivey; contractor, I. E. Kent; signed, Sept. 14; filed, Sept. 18; cost $1,600.

Kings Ave. and Caroline street. Alterations and additions; owner, S. J. Loop; contractor, A. R. Denke; signed, Sept. 2; filed, Sept. 11, cost $900.

San Lorenzo, on the Perkins tract. One-story frame; owner, E. C. Perkins; architect, Chas. Mau; contractor, R. Albertson; signed, Sept. 6; filed, Sept. 11; cost $1,892.

Teutonia H'd. Assoc. To build stable; owner. Geo. Whittell; architects, Cox head & Coxhead; contractor, J. J. Boyle; signed, Sept. 25; filed, Sept. 29; cost $2,980.

Twelfth and Washington, Oakland. Cement work on two-story brick; owners Henry, Sol and Fred Kahn; architect, W. J. Mathews; contractor, F. W Wetmore; signed, Sept. 16; filed, Sept. 18; cost $1,100.

THIS journal is prepared to take charge of rendering perspective drawings in pen and ink or color. Charges will depend on size and kind of drawing wanted.

Upon receipt of plan and elevations, with a description of what is wanted, we will submit our estimates for the performance of the work.

WE present to our readers to-day copious extracts from the Progress Report of Engineers in charge to devise and provide a system of sewerage for San Francisco.

This report shows in a graphic and succinct way the gross fraud and incompetence which has characterized the designing and construction of drainage works of this city. The dismissal of theEngineers in charge was in keeping with the discourteous dismissal of the previous Board of Engineers. The whole matter of spending the public and private funds is now turned over to the tender mercies of the politicians who infest the City Hall. We see no reason why a substantial saloon keeper should not be elected City and County Attorney since unprofessional men are elected to carry out the work of Civil Engineers in other departments.

For years the necessity of devising a proper system of sewerage for the city of San Francisco has been apparent to everyone. Time and again has the matter been brough to the attention of the public and the public officials, and the dangers to health and life pointed out in no uncertain terms. Last year it did really seem as if the time of deliverance was approaching; a competent Sewerage Commission was organized, and an efficient band of engineers chosen to investigate the whole subject, and propose a practical solution of the problem. But it was too much to expect that a body independent of political control, could exist in this city. On the farcical plea of pretended economy the Board of Supervisors resolved to dispense with the services of the Sewerage Commission and the Board of Engineers, and once more the health of a great city was left to take such care of itself as it best may.

The time will come, however, when the imperative nature of the needed reforms will be felt in a way to command recognition, and the longer this recognition is delayed, the more disastrous will be the results of delay, and the more expensive the remedy required.

THE favorable progress still continues to be made with the erection of the exhibition buildings designed to house the wonders to be shown at the coming California Midwinter International Exposition. Not only are the main buildings almost all covered in, but the smaller buildings for the different counties and the special features, are well under way. The Firth Wheel, the Cyclorama of the Volcano of Kilauea, the Japanese Village, and the various attractions too numerous too mention in detail at present; but our subscribers may rest assured that at the proper time the CALIFORNIA ARCHITECT will present to its readers in its usual attractive form all the notable features of what bids fair to be a credit to the State, and a great attraction to the visitors from the east and other parts of the world.

THE ARCHITECTURAL LEAGUE OF NEW YORK.

NINTH ANNUAL EXHIBITON.

THE Ninth Annual Exhibition of The Architectural League of New York, will be held at the American Fine Arts Society's Building, 215 West 57th street, New York City; from Monday, December 18th, 1893 to Tuesday, January 9th, 1894, inclusive.

The Exhibition will include: Architectural Designs Embodied in Plans, Elevations and Sections and shown in Perspective; Finished Detailed Working-drawings; Designs for Decoration, Furniture and Allied Work; Cartoons for Stained Glass; Full-size Working drawings for Ornament, Models of executed or proposed Work; Completed work such as Carvings in Stone or Wood, Bronze, Wrought-Iron, Mosaic, Glass, Textile Fabrics and Furniture; Sketches, Drawings and Paintings of Architectural or Decorative Subjects.

Photographs will be admitted only when they serve to elucidate an accepted exhibit. It is especially requested, that all perspective drawings of architectural subjects shall be accompanied by plans drawn to a small scale.

Exhibits will be received at the Fine Arts Society's Building on and after Wednesday, December 6th; none can be received after Tuesday, December 12th.

The League will collect and return, free of charge to exhibitors, in New York City, Philadelphia and Boston, all exhibits that have been properly entered; all others must be delivered at the Fine Arts Society's Building, carriage prepaid and ready for exhibition.

The private view for Exhibitors, the Press and Members of the Architectural League will be given on Friday, December 15th, from 10 A. M., to 4 P. M.

Collections will be made as follows: In New York City on Thursday, Friday and Saturday December 7th, 8th and 9th, by W. S. Budworth & Son, No 1 West 14th street.

In Boston, on Wednesday and Thursday, December 6th and 7th, by Williams & Everett, 190 Boylston street.

In Philadelphia, on Wednesday and Thursday, December 6th and 7th, by Isaiah Price, 10 South 18th street.

The enclosed blank must be filled out and sent to the Secretary before November 24th. No work will be sent for unless the entry for it has been received by the Secretary, Mr. Charles I. Berg, No. 10 West 23d street.

All exhibits must be properly labelled.

Drawings must be either framed or mounted.

Exhibits of non-resident members are to be sent to a consignee in New York, who will deliver them at the Fine Arts Society's Building, and return them to the exhibitor at the close of the Exhibition.

The names of such consignee are: William S. Budworth & Son, No. 1 West 14th street; Thomas A. Wilmurt, 54 East 13th street; F. Harrison Mills, 147 East 23d street.

The Committee on Exhibitions will be the jury for the selection and arrangement of all exhibits.

For the Committee on Exhibitions: William B. Tuthill, Chairman Sub-Committee on Architecture.

Committee on Exhibitions: George B. Post, Chairman Ex-Officio; Warren R. Briggs, Ex-Officio; Frank A. Wright, Ex-Officio.

Sub-Committee on Architecture: George Keister, Bruce Price, William B. Tuthill, Chairman.

Sub-Committee on Decoration: D. C. French; Will H. Low, F. S. Lamb, Chairman.

REPORT OF THE ENGINEERS IN CHARGE TO DEVISE AND PROVIDE A SYSTEM OF SEWERAGE.

SAN FRANCISCO, JULY 15, 1893.

To the Honorable, the Board of Supervisors of the City and County of San Francisco—

GENTLEMEN: We submit herewith a progress report covering the work done by the board of engineers as finally organized on August 27, 1892, under Resolution No. 6612 (Third Series), and that of the Engineers in charge to devise and provide a system of sewerage, appointed by Resolution 8294 (Third Series), together with a careful compilation of official street grades in the form of a supplement. * * *

THE PRESENT SITUATION.

Immediately upon final organization of the Board of Engineers, the investigation of the condition of the sewers now in use in San Francisco was commenced and records were searched to supplement the results of this investigation in order to make this data, which is essential as a basis for the work of the Board, available in a comprehensive and readily accessible form. Entering upon this work of collecting and compiling data with reference to the character and condition of sewers now in use, it was at once found that the records could not be relied on to disclose the size or character of the sewer in any particular street. The information concerning sewer gradients was, we may say, entirely lacking, and the information concerning depths of sewers below street grade was so fragmentary and in such unsatisfactory form as to be of no value whatsoever. Moreover, it was at once found that specifications for sewer constructions were, and had been, general in character, wish no special requirements to fit particular cases, except for a few sewers that were constructed for districts and according to plans specially ordered to be prepared for such districts; that the specifications, whether of the general or of a specific character, were not closely adhered to, and were often grossly violated, and that no record was preserved showing what was actually

done and to what extent a deviation from plans and specifications had (whether rightfully or not) been permitted by the authorities in charge of sewer construction.

It has heretofore been generally required in the specifications that pipe sewers shall have "openings twenty-five feet apart, sufficiently large to receive a six-inch pipe." As the subdivision of street frontage in the residence portion of the city is generally into twenty-five foot lots, it is evident that this requirement is intended to insure available openings for house connections twenty-five feet apart on each side of every pipe sewer. Yet, within a year, sewers have been constructed under these specifications with less than one-tenth of the required number of Ys for house connections in place, and others have been accepted as properly constructed although the openings required were put upon alternate sides of the sewer, making those upon either side fifty feet apart. In no case however, not even when the specifications were strictly complied with, has a record of the position of the Ys been preserved, and the lack of information as to position of openings for house connections is so indefinite that it has long been customary to disregard their existence entirely and to make house connections by breaking through the sides of the sewers wherever convenient. Under such circumstances it is not surprising that the necessity for the number of openings prescribed by ordinance and required by specifications is not recognized by contractors, and that believing the Ys useless, as many as possible are omitted.

The general specifications as handed down by one set of officers to the next during many administrations require that "steps must be placed in each manhole, formed of half-inch iron set well into the brickwork, etc.," yet for years past the manholes have been constructed without steps.

These and other deviations from specifications are and have been very common in connection with sewer construction in San Francisco, and it is pertinent to inquire why they are possible.

No comprehensive sewer and drainage system for San Francisco has ever been made the guide in the matter of sewer construction. We are at this late date charged with devising one. But even if one had been designed, modifications of detail due to the extension of streets, changes of street grades and other unforeseen conditions would have to be made from time to time.

The duty of preparing the plans and specifications for sewers required from time to time falls to the City and County Surveyor. He prescribes gradients and exercises control over line and grade. The supervision of construction, however falls to the Superintendent of Streets, whose department is required to compel strict compliance with specifications.

Sewers are constructed either by public or private contract. In case of sewer construction by public contract, all proceedings, the calling of bids, the awarding of the contract and the execution of the work are in direct charge of the city officers.

In the case of sewer construction by private contract, the planning and supervising of the work are in charge of city officials, but the authorities are not concerned in the award of the contract, except that before any private sewer construction can be undertaken, a permit for the work must be secured from the Superintendent of Streets.

Whether done by public or private contract, the work is to conform to requirements prescribed by ordinance and specifications, and it is the duty of the Superintendent of Streets to know that there are no deviations from such requirements. Whether constructed by public or private contract, all sewers in streets that have been finally accepted as improved streets must be maintained and kept in repair at public expense.

The original cost of sewers falls upon the property benefitted in proportion to amount of benefit and in proportion to street frontage. In the case of all local sewers, the first cost falls on the property fronting upon the streets sewered.

Although it would appear that by reason of being required to furnish plans and specifications for each sewer constructed, the City and County Surveyor is interested in knowing that the plans are carried out and that the specifications are complied with, it seems to have become a well established custom for that office to participate in ordinary sewer work only to the extent of giving the contractor line and grade for his work, and of certifying to the fact that the sewer at its manholes, when completed, has a depth below street grade as named in the certificate then issued.

The City and County Surveyor charges fees prescribed by ordinance for his services, and as he personally bears all the expenses of surveys it is natural to suppose that he will endeavor to keep his expenses as low as possible. It is not surprising, then, that when information in his office justifies such a course, he issues diagrams to the contractor with instructions to conform to street curbs for line and grade, or to place the sewer at "10 feet below street grades if connections will allow," furnishing reference points in the latter case from which a skillful contractor establishes his own grade line.

This system of issuing indefinite, unintelligible instructions to contractors, and for the guidance of superintendents of streets, pervails to-day, but it is not of recent origin; it has been in vogue throughout many administrations and has led to innumerable defects in construction that will entail great expense to correct.

To the engineering profession the explanation is due in this connection that the office of City and County Surveyor is an elective one, that party politics can be relied on in San Francisco no more than elsewhere to consider qualifications for office a prerequisite to election, and that the responsibility for all sewer work has fallen partly upon the Surveyor and partly upon the Superintendent of Streets. Without such explanation it would indeed be difficult to account for the persistent lack of endeavor to effect a reform. The system of municipal administration is at fault, more than the individual officers, and better results will be difficult of attainment until the construction of sewers receives intelligent and honest engineering direction and supervision. In this connection Hon. William Alvord, Mayor of San Francisco, in his address when retiring from office, says: "If the offices of Superintendent of Streets and Surveyor were united, and the Surveyor allowed the same executive aids which the Superintendent now has, receiving only a salary for his duties, it would be possible to prosecute such works as the opening, grading, paving and sewering of streets according to a comprehensive scientific method and at greatly reduced cost to property holders, who are now assessed doubly and trebly by reason of the many mistakes made in detached improvements. The want of able scientific direction in this department is more especially evident in the matter of sewerage. At present short, isolated sewers are often constructed, without outlet and without reference to ultimate connection with the mains forming part of a well studied, comprehensive system, because such a system has not been commenced or planned."

So lax has been the system of administration in this direction that it is safe to say that superintendents of streets have, more frequently than even the several City and County surveyors, been permitted to prescribe the character and size of sewers to be constructed. The work of sewer construction has moreover been carried forward piecemeal, generally a block or a crossing, rarely a few blocks at a time, according to the temper and inclination of the property holders.

The general specifications for sewer construction being the supposed basis of sewer work, and there being no comprehensive scheme of drainage to adhere to, it has been perfectly natural for the official in direct charge of sewer maintenance and sewer cleaning to insist upon carrying out his views, even in the matter of determining what kind of a sewer should be constructed in any block or in any street crossing, though in fact the only qualification that could be claimed as justifying the assuming of such a responsibility was practical experience in street matters, and the intelligence and common sense supposed to be a part of the stock in trade of every city official.

Only when it seemed advisable to carry out sewer construction as a work of benefit to a district, in which case the City and County Surveyor has had an opportunity of mak-

ing a special charge for plans and specifications, does he seem to have been consulted as to general requirements, and not alone as to line and grade. * * *

Very soon after the organization of the Board of Engineers, whose successors we are, the following letter was sent to the Hon. Board of Supervisors:

To the Honorable Board of Supervisors
of the City and County of San Francisco—

GENTLEMEN:: At the outset of our investigation we find that a practice has long been prevalent of constructing brick sewer crossings where none are necessary, and of making many lateral sewers of much larger dimensions than actually required.

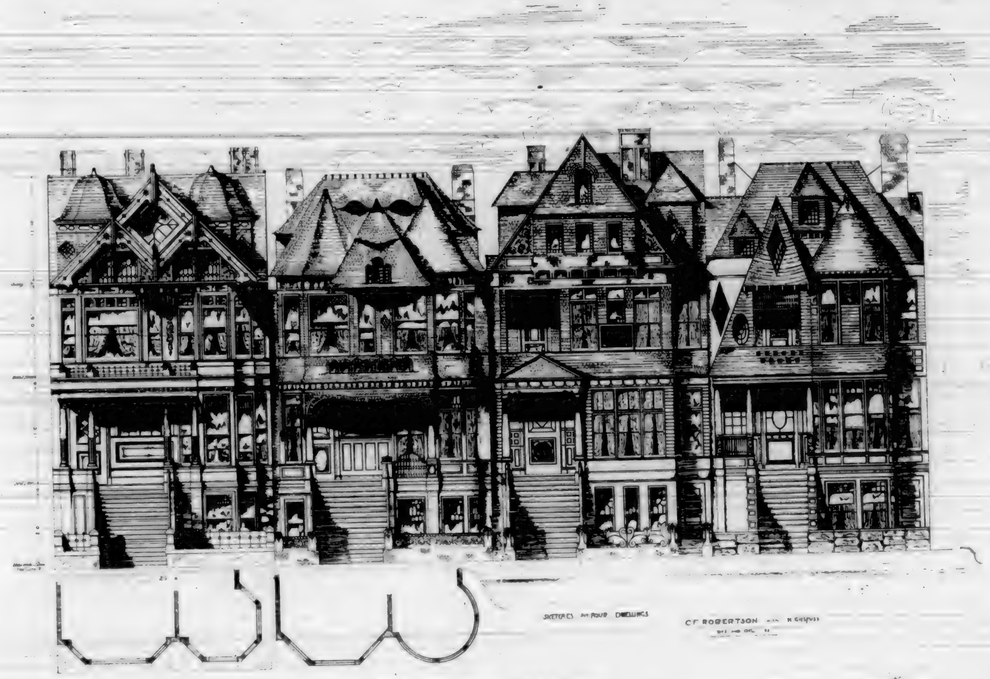
Lateral sewers of excessive size are not only more costly in construction and maintenance than properly proportioned sewers would be, but are detrimental to health by reason of the difficulty of properly flushing them.

"FURTHER RESOLVED, That the City Surveyor be and is hereby requested to consult with the said Board of Engineers in the preparation of specifications for sewer work, so that the same may be constructed in a manner to harmonize with the plans to be hereafter adopted to provide for a proper system of sewerage."

The letter above quoted is self-explanatory.

The absurd practice of constructing large brick sewers in street crossings has extended into all parts of the city. As a result of this practice and the construction of sewers in detached sections, a block or a crossing at a time, several distinctive types of sewer crossings have resulted which it will be necessary to describe somewhat in detail.

In the first place, all sewers in level street crossings are level from end to end, or very nearly level, no matter at what gradients the respective streets approach the crossing. This is a fruitful source of trouble, because at the points where gradients suddenly change regular flow is interfered



ROW OF CITY DWELLINGS.

with; deposits result in the level stretches, which often remain for long periods, and sometimes can only be entirely removed by flushing, and immediately after removal begin to reaccumulate. This applies to intersecting brick sewers as well as the intersecting pipe sewers when no brick sewer intervenes between them and the manhole at the center of the street crossing. * * * * * * *

Should your Honorable Board so desire, this Board will be pleased to advise in these matters and to pass on any project, plans or specifications which may be referred to us, to the end that more systematic and economical work may be at once inaugurated.

The suggestion contained in the letter was at once acted upon, and a resolution was passed containing the following:

RESOLUTION NO. 7481 (THIRD SERIES.)

"RESOLVED, That the Superintendent of Streets be and is hereby requested, before recommending the construction of sewers to this Board, to first submit the proposed sewer work and the location of same to the Board of Engineers appointed to devise and provide a system of sewerage, for their opinion and approval:

"FIRST—As to the necessity of the proposed sewer.

"SECOND—As to the required inside diameter or other dimensions of the sewer, its grade and required depth.

"THIRD—As to the material to be used in constructing the sewer.

SUPPLEMENTAL REPORT IN COMPLIANCE WITH RESOLUTION NO. 9157, (THIRD SERIES.)

ABOLISHING THE OFFICE OF ENGINEERS IN CHARGE TO DEVISE AND PROVIDE A SYSTEM OF SEWERAGE AND TERMINATING THE WORK.

SAN FRANCISCO, CAL., SEPTEMBER 30th, 1893.

To the Honorable Board of Supervisors
City and County of San Francisco—

GENTLEMEN: Complying with instructions contained in Resolution No. 9157 (Third Series) which provides that this

Department be abolished from and after September 30th, 1893, and that the "Board of Engineers are hereby required to turn over and file in the office of this Board all maps, books, data, etc., with a full report on or before said date," we have turned over to you all maps, books, papers, furniture, material and other property under our control as per inventory hereunto attached, and hold the receipt of your clerk for the same.

In our Progress Report, submitted under date of July 15th, we have clearly set forth the defects of the present system of administrative and executive control of public works in this city, with special reference to sewers, and have cited a sufficient number of instances of evils resulting from divided official responsibility, faulty design, carelessness, ignorance and fraud, to convince every intelligent citizen of the need of a better system of planning, directing and managing public works as well as of the need of a comprehensive system of sewerage, which has long been recognized and is daily increasing. To this Progress Report we have but little to add.

In a reply to a communication from Wm. Broderick, Auditor, at the close of the last fiscal year, copies of which were sent to his Honor, L. R. Ellert, the Mayor, and to the chairman of the Finance Committee, we call attention to the urgent necessity for abating many of the serious nuisances created in different parts of the city by defects in the sewers for which the city is responsible and recommending that $100,000.00 be made available to be extended under our supervision, for work planned by us for the protection of the health of the people.

For the prosecution of the work with which we were specially charged, the devising of a system of sewerage, we requested that $20,000.00 be made available, and also emphasized the necessity of making surveys to serve as a basis for establishing grades throughout those portions of the city where not already established, and of correcting grades where a revision was essential.

It was considered impossible to comply with these recommendations although the urgency of them was not questioned. In their stead the sum of $40,000.00 was set apart to be expended for modifications of the flow of sewage and the expenses of this office. We thought we had reason to expect more in view of the importance of our work, its recognized necessity, and the fact that we had turned into the general fund an unexpended balance of $17,238.48 at the end of the last fiscal year, which had not been expended because it would not have been to the best interests of our work to use it, as explained in our Progress Report. We received no intimation as to the apportionment which we were to make of the $40,000.00 set apart for our use, but the necessities were such in some portions of the city, where there have been annually recurring outflows of sewage from the sewers into the streets, yards, cellars and even houses, notably in the low portions of Eleventh Ward, that we are impelled to plan corrective works and suggest remedial measures as outlined in our two reports dated September 7th, 1893.

The plans and specifications for these works are now on file among the papers turned over to you by us. They do not by any means cover all the work which we had intended to recommend as necessary to correct the most glaring of that class of present evils whose existence is chargeable to a bad administrative system and the negligence, incompetence or corruption of representatives of the city. But these improvements are the most important and would if carried out have involved an expenditure estimated by us at $27,000.00, being as great an amount as we thought ourselves justified in expending out of our limited appropriation.

They were not planned as a part of any proposed comprehensive system, but are intended to make efficient some of the principal existing sewers. Had a greater fund been made available for such corrective work, we should have suggested among many minor changes the improvement of Fell street sewer on Fourteenth street between Church and Dolores, where its grade needs correction; a change in Seventh street sewer where at Townsend street, the extension toward Channel street was this year constructed twenty inches higher than the bottom of the old sewer north of Townsend street, and to this extent permits the accumulation of filth, and is an obstruction to the flow of sewage down Seventh street; a correction of grade in Sixteenth street sewer near Folsom street where there is a slope the wrong way; some corrective work near Pacific and Davis streets where the continuity of the Pacific street sewer is interrupted by a sudden rise of two and one half feet; besides the improvement of scores of sewer crossings in all parts of the city.

The necessity for the immediate carrying out of some corrective work was forced upon our notice in making a study of the character, condition and serviceability of the existing

sewers, and we have recommended some of this necessary work, believing ourselves authorized to act in such matters at least in an advisory and supervising capacity by the resolution under which we were appointed and which directs us "to devise and provide a system of sewerage for this City and County." * * * * * *

As explained in our Progress Report it is essential that the system should be planned with due regard to the probable growth of the city, so that without reconstruction of main lines the system can be adapted to further requirements.

Although we are not now prepared to fully endorse any project we feel it our duty to submit at this time a brief outline of some of the measures which we believe will have to be intelligently and honestly carried out before this community will have received from the proper authorities that relief which it is of right entitled to demand. * *

ILLUSTRATIONS

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

THE Court House at Glen Ellen is by John M. Curtis, architect of this city.

A Competitive design for the addition to the Alameda Court House is by J. W. Cuthbertson, architect.

R. H. White has an illustration of his residence of which he is the architect.

RESIDENCE of C. L. Ruggles at Stockton, Cal., is by Architect George Rushforth of that city.

THE CEMENTING OF STEAM PIPE JOINTS.

THE German technical papers are remarkable for the practical receipts which they contain; not that our own journals do not contain practical receipts, but because those in the German papers, instead of being copied from ancient receipt-books or concocted at random, usually bears the name of some well-known scientific man, and are based on reasoning as well as experience. One of these receipts, by Herr K. Keyfar, is copied in the *Bautechnische Zeitschrift*, and is worth remembering by architects, as well as by steam-fitters and plumbers. As is well known, the cement used for making tight the joints of steam-pipes and other ironwork exposed to heat and pressure is a pinkish putty, now commonly made with a mixture of white and red lead, although it is not long since pure red lead was supposed to be the only proper material. This lead-putty is, however, according to Herr Feyfar, often carelessly and ignorantly made, so that it fails, sometimes to a dangerous extent, to do what is required of it. Properly, the cement for putting together steam-pipes should be made with equal parts of pure red and white lead, thoroughly mixed and well kneaded with pure linseed oil, which has been rendered drying by boiling with ten per cent of red lead. Workmen in steam-fitting shops do not know much about the properties of oils, and often mix their putty with raw linseed oil or grease, or even kerosene. It is hardly necessary to say that coal-oil is soon volatilized by the heat, leaving the white and red lead in the form of power. Grease is not much better, and raw linseed oil hardens slowly, and should not be employed. Where the materials are suitable the putty sets quickly, and becomes so hard that it can with difficulty be cut with a chisel. The mixture of red and white lead has certain advantages over either separately, which should be understood. Red lead alone gives a hard and quick-setting cement, but the red-lead putty is not very plastic, and does not cling well to the surfaces of the iron. White lead alone makes a plastic and adherent putty, but while red lead gives up a part of its oxygen to the oil, so that a red lead putty hardens all through, white lead does not yield oxygen, and a mass of white-lead putty hardens only on the surface, remaining for a long time soft in the interior. A mixture of the two substances combines the advantages of both. In kneading the putty, care should be taken not to allow iron filings or bits of dust to get into it. Where the joint is not to be exposed to heat, chalk may be added to the putty in quantities equal to that of the white lead. If the drying must be hastened, a little brown oxide of manganese, very finely ground, will help it. For hot joints, finely ground graphite, in quantity equal to the white lead, may be added, but the granite cement does not set so quickly as the lead alone. The surfaces to be joined should be even, as left by the turning-lathe or planer, but the putty will not stick well to a polished surface. Where the putty alone must support a severe pressure, as in the case of a flange-joint in a steam-pipe, it is best to strengthen it by inserting in the joint a piece of paper or felt, covered with putty on both sides, and if the joints are very rough, as in the case of flanges which have not been turned or planed, it may be best to mix some threads of hemp or flax with the putty, but care should be taken not to use too much. Where the joint is exposed to great heat, no combustible substance, such as flax or hemp, is suitable, and the best way is to cut out a piece of wire gauze, spread it thickly over with putty, and lay in the joint. It is sometimes necessary to make steam-tight joints in such a manner that they can be readily taken apart and replaced, as in the case of the man-hole of a boiler or the head of a cylinder. For making these joints the lead-putty is unsuitable, as it becomes to hard to be easily removed, and it is best to employ felt or soft paper, soaked with boiled linseed oil. If possible, sheets of such paper should be previously prepared by soaking with the oil and drying, and, when used, they should be cut to the proper shape, covered on both sides with boiled oil and laid in the joint.—*American Architect and Building News.*

CLAY EMBANKMENTS.

THE support of embankments, where clay forms a considerable part of the material, is a kind of mystery to the unskilled owner and builder of such embankments. In Marine County, opposite this city, for example, there are clay strata all over the slopes, and slides thus caused can be seen on every hand, so the conclusion is that clay will not stand as an embankment unless held by bulkheads of masonry or wood. The fact is, however, that clay stands very well at an angle of 45 degrees, or 1 to 1, if it is drained; but runs like mortar at 16 degrees, or 3 to 1, if saturated. It is all a question of water. No other material is so much affected by saturation. It is at the same time the best and worst material for an embankment. A range of 16 to 45 degrees between drained and undrained embankments is phenomenal. Clay embankments require drains to be placed at frequent intervals, and should have laths of wood, straw or other substance laid in, to form leading channels or perforations connecting to the drains.—*Industry.*

DRUIDIC STONES.

THE prospects seems to be that our great-grand children will know about the remains of the period known as Druidical, or megalithic, only through books, says *The American Architect and Building News*, for the actual monuments of the period are fast disappearing. The estates containing the principal collections of Druidic stones in Brittany have been bought by the Government, but no provision is made for guarding them, and ignorant and mischievous picnickers who visit them are allowed to do as they please with them. In England, the great monument of Stonehenge, which, if not so extensive as that of Carnac, is more perfect, is said to be now totally neglected by its owner. A few years ago, a man was detailed to keep order among the visitors, but this guardian is said to have been withdrawn of

late, and there is nothing to prevent people from building fires under the granite colonnade if they wish.

If Stonehenge and Carnac are fated to disappear from the earth, at least let some effort be made, before they vanish, to find out something of their real history. It is generally agreed that, far from having been built by the Druids, they existed ages before the rise of the Druidic system, but this conclusion only makes their origin still more obscure. It is said that the huge monoliths of the inner ring at Stonehenge are of a peculiar granite, no quarry of which exists nearer than Africa. If this is true, as we suppose it is, the transportation of these great blocks indicates not only a considerable development of the arts of navigation and mechanics among the people who brought them to England, and set them up many miles from the shore, but a connection, either religious or commercial, between Africa and England, to which recorded history gives no clue whatever. It has been said that monuments of the characteristic megalithic pattern are found not only in England and northern France, the Lyonnesse of the legendary period, but in the Southern Lyonnesse, of which the city of Lyons was the capital, and from there westward, along the Mediterranean shore, through Spain. It is said, also, that in Spain and western France these monuments, instead of being scattered thickly over an extensive tract, as in the two Lyonnesse countries, are found at intervals along a certain route, but not elsewhere, as if the people who built them were, in Spain and Provence, foreigners, passing frequently along an established route, as caravans pass through Africa or Tartary, and erecting the symbols of their religion only along the road which they frequented. No mention is, however, made in history of any race trading over such a route, or of any connection between what seems to have been two great Celtic communities, and still less is any clue given to the connection between these communities and Africa. In fact, there is internal evidence that the trilitha of Stonehenge were placed in position before the pyramids of Egypt were built, and if this evidence can be relied upon, the megalithic monuments belong to a period at least two thousand years anterior to that at which the first glimmerings of European history appears. What manner of men lived in England and France two thousand years before the Trojan war we may well be curious to know, and every indication that can be compared with other indications to throw light upon the question should be studied and recorded without delay.

PAY AS YOU GO.

Our friend and colaborer, Mr. Watson of the *Engineer*, New York, when he is a line short often finishes out with a little proverb, says *Industry*, which if properly expanded would swell up and fill the column. In a late issue we find the following: "Pay as you go; if you can't pay don't go." Here in ten words is the whole scheme of human economics; the secret of failure; the key to dishonesty; and the science of human happiness. If one will stop to consider the share of human wrongs that grow out of "going without pay," what is left will be a beggarly remainder. This motto we suspect is one tacked up behind Mr. Watson's desk, he pays as he goes and makes others do so, but among the great mass of our people in this country how many follow such a rule? To do without what you cannot pay for is the great art of successful life. It is a habit of mind and practice, easy to follow when once commenced, but when the "pay" gets behind the "going," it commonly takes more than a life time to catch up.

CALICHE CEMENT.

CALICHE, the name given by the old Spanish settlers of Arizona to a sort of half rock, half clay material, proves on analysis to be a valuable geological formation and bids fair to enter the commercial arena ere long as a new cement.

The caliche lies upon the surface or very near it. It is often found from six to twenty-five feet in thickness and covers many thousands acres of surface. Whenever found it was until recently considered a decided detriment—it interfered with the cultivation of the soil, was useless for grazing purposes and produced no precious metal. In these three items were found almost the limit of Arizona's supposed resources. But not long since, samples of this peculiar "worthless" clayey rock were sent to competent chemists for analysis, with the result that this much abused caliche was declared by them to contain the proper constituents in the proportions to make the very best Portland cement. In fact the analysis indicated the same constituents in almost the same proportion as in the best English Portland cement. Some of the samples contained about twenty per cent of sand, but it is claimed that much of the material contains no sand and also that the sand can be readily eliminated.

Should the claims as at present made prove practically true the discovery is one of large importance, as the use of Portland cement is constantly and rapidly increasing and forms a large item in our imports. And if the caliche, which is so plentiful and is easily and cheaply obtained will furnish a product approximately equal to English Portland cement. it will prove a mine of wealth to Arizona, to the owners of the caliche beds and to all interested in new construction in the line of buildings, bridges, aqueducts or dams and street improvements. It would soon result in cheapening the article and also—an item of no less importance—diminish our imports of it from foreign countries, adding that much to the country's independence and the nation's wealth.—*Manufacturer and Builder.*

CROIX CATELAN.

PEOPLE who have driven through the Bois de Boulogne will probably remember the "Croix Catelan," which, although not a cross, but a pyramid, is supposed to have been erected about the year 1700 on the site of a memorial cross, dating from the middle of the thirteenth century. What was the person or thing commemorated by the original cross and consequently, who or what it is proper to think of in contemplating its modern substitute, has been much disputed. The favorite legend is that a troubadour, named Arnaud Catelan, loved the princess Marguerite of Provence, and, when she left the South to become the wife of King Louis the Ninth, followed her on foot, carrying with him some verses, and a few faded Provencal flowers, as a wedding gift. When he arrived in Paris, the king and queen had left their castle of the Louvre, and were making a visit to the king's native town of Poissy. The road from Paris to Poissy, though only fifteen or sixteen miles long, lay through the Bois de Boulogne, then called the Forest of La Rouvraye, which was infested with robbers, and the officers, of the castle gave Arnaud an escort, to conduct him safely through the wood. On the way, Catelan, rejoiced at being so near the end of his journey, made a confidant of the captain of his escort, and showed him the little box which, as he said mysteriously, contained treasures to be offered to the queen. The captain apparently thought that the queen had treasures enough, and that this would be an excellent opportunity for enabling her to share some of them with her subjects; so, when they reached the depths of the forest, he and his men fell upon the troubadour and slew him, and gained possession of the precious box. On opening the case, to get out the jewels which he supposed it contained, he was disgusted to find nothing in it but some sentimental verses, and a packet of dry flowers. The verses he threw away at once, but the flowers had an aromatic scent which pleased him, and he kept them to perfume his clothes on state occasions. The corpse of the poet was soon afterwards found in the wood, but there was no clue to his assassins, and a prolonged investigation revealed nothing. One day, however, Queen Marguerite held a reception, and the captain of the escort appeared to pay his respects to his sovereign. As he approached, the queen recognized the fragrance of Provencal flowers, and a suspicion came into her mind. Officers were sent to search his habitation, and more relics of the troubadour were discovered. The captain was seized, with others of the poet's escort, and they were all roasted over a slow fire, while the king and queen had a stone cross set up on the spot where the unfortunate Catelan had met his death.—*The American Architect and Building News.*

late, and there is nothing to prevent people from building fires under the granite colonnade if they wish.

If Stonehenge and Carnac are fated to disappear from the earth, at least let some effort be made, before they vanish, to find out something of their real history. It is generally agreed that, far from having been built by the Druids, they existed ages before the rise of the Druidic system, but this conclusion only makes their origin still more obscure. It is said that the huge monoliths of the inner ring at Stonehenge are of a peculiar granite, no quarry of which exists nearer than Africa. If this is true, as we suppose it is, the transportation of these great blocks indicates not only a considerable development of the arts of navigation and mechanics among the people who brought them to England, and set them up many miles from the shore, but a connection, either religious or commercial, between Africa and England, to which recorded history gives no clue whatever. It has been said that monuments of the characteristic megalithic pattern are found not only in England and northern France, the Lyonnesse of the legendary period, but in the Southern Lyonnesse, of which the city of Lyons was the capital, and from there westward, along the Mediterranean shore, through Spain. It is said, also, that in Spain and western France these monuments, instead of being scattered thickly over an extensive tract, as in the two Lyonnesse countries, are found at intervals along a certain route, but not elsewhere, as if the people who built them were, in Spain and Provence, foreigners, passing frequently along an established route, as caravans pass through Africa or Tartary, and erecting the symbols of their religion only along the road which they frequented. No mention is, however, made in history of any race trading over such a route, or of any connection between what seems to have been two great Celtic communities, and still less is any clue given to the connection between these communities and Africa. In fact, there is internal evidence that the trilitha of Stonehenge were placed in position before the pyramids of Egypt were built, and if this evidence can be relied upon, the megalithic monuments belong to a period at least two thousand years anterior to that at which the first glimmerings of European history appears. What manner of men lived in England and France two thousand years before the Trojan war we may well be curious to know, and every indication that can be compared with other indications to throw light upon the question should be studied and recorded without delay.

PAY AS YOU GO.

Our friend and colaborer, Mr. Watson of the *Engineer*, New York, when he is a line short often finishes out with a little proverb, says *Industry*, which if properly expanded would swell up and fill the column. In a late issue we find the following: "Pay as you go; if you can't pay don't go." Here in ten words is the whole scheme of human economics; the secret of failure; the key to dishonesty; and the science of human happiness. If one will stop to consider the share of human wrongs that grow out of "going without pay," what is left will be a beggarly remainder. This motto we suspect is one tacked up behind Mr. Watson's desk, he pays as he goes and makes others do so, but among the great mass of our people in this country how many follow such a rule? To do without what you cannot pay for is the great art of successful life. It is a habit of mind and practice, easy to follow when once commenced, but when the "pay" gets behind the "going," it commonly takes more than a life time to catch up.

CALICHE CEMENT.

CALICHE, the name given by the old Spanish settlers of Arizona to a sort of half rock, half clay material, proves on analysis to be a valuable geological formation and bids fair to enter the commercial arena ere long as a new cement.

The caliche lies upon the surface or very near it. It is often found from six to twenty-five feet in thickness and covers many thousands acres of surface. Whenever found it was until recently considered a decided detriment—it interfered with the cultivation of the soil, was useless for grazing purposes and produced no precious metal. In these three items were found almost the limit of Arizona's supposed resources. But not long since, samples of this peculiar "worthless" clayey rock were sent to competent chemists for analysis, with the result that this much abused caliche was declared by them to contain the proper constituents in the proportions to make the very best Portland cement. In fact the analysis indicated the same constituents in almost the same proportion as in the best English Portland cement. Some of the samples contained about twenty per cent of sand, but it is claimed that much of the material contains no sand and also that the sand can be readily eliminated.

Should the claims as at present made prove practically true the discovery is one of large importance, as the use of Portland cement is constantly and rapidly increasing and forms a large item in our imports. And if the caliche, which is so plentiful and is easily and cheaply obtained will furnish a product approximately equal to English Portland cement, it will prove a mine of wealth to Arizona, to the owners of the caliche beds and to all interested in new construction in the line of buildings, bridges, aqueducts or dams and street improvements. It would soon result in cheapening the article and also—an item of no less importance—diminish our imports of it from foreign countries, adding that much to the country's independence and the nation's wealth.—*Manufacturer and Builder.*

CROIX CATELAN.

PEOPLE who have driven through the Bois de Boulogne will probably remember the "Croix Catelan," which, although not a cross, but a pyramid, is supposed to have been erected about the year 1700 on the site of a memorial cross, dating from the middle of the thirteenth century. What was the person or thing commemorated by the original cross and consequently, who or what it is proper to think of in contemplating its modern substitute, has been much disputed. The favorite legend is that a troubadour, named Arnaud Catelan, loved the princess Marguerite of Provence, and, when she left the South to become the wife of King Louis the Ninth, followed her on foot, carrying with him some verses, and a few faded Provencal flowers, as a wedding gift. When he arrived in Paris, the king and queen had left their castle of the Louvre, and were making a visit to the king's native town of Poissy. The road from Paris to Poissy, though only fifteen or sixteen miles long, lay through the Bois de Boulogne, then called the Forest of La Rouvraye, which was infested with robbers, and the officers, of the castle gave Arnaud an escort, to conduct him safely through the wood. On the way, Catelan, rejoiced at being so near the end of his journey, made a confidant of the captain of his escort, and showed him the little box which, as he said mysteriously, contained treasures to be offered to the queen. The captain apparently thought that the queen had treasures enough, and that this would be an excellent opportunity for enabling her to share some of them with her subjects; so, when they reached the depths of the forest, he and his men fell upon the troubadour and slew him, and gained possession of the precious box. On opening the case, to get out the jewels which he supposed it contained, he was disgusted to find nothing in it but some sentimental verses, and a packet of dry flowers. The verses he threw away at once, but the flowers had an aromatic scent which pleased him, and he kept them to perfume his clothes on state occasions. The corpse of the poet was soon afterwards found in the wood, but there was no clue to his assassins, and a prolonged investigation revealed nothing. One day, however, Queen Marguerite held a reception, and the captain of the escort appeared to pay his respects to his sovereign. As he approached, the queen recognized the fragrance of Provencal flowers, and a suspicion came into her mind. Officers were sent to search his habitation, and more relics of the troubadour were discovered. The captain was seized, with others of the poet's escort, and they were all roasted over a slow fire, while the king and queen had a stone cross set up on the spot where the unfortunate Catelan had met his death.—*The American Architect and Building News.*

INTERNATIONAL IRRIGATION CONGRESS.—The official Proceedings of the International Irrigation Congress, held at Los Angeles, California, October 10th to 14th, have just been issued in pamphlet form. The book contains nearly two hundred pages and embraces the Call for the Congress; the Addresses of Welcome; a List of Delegates; Permanent Organization; Address of the President; Formal Opening Address; Resolutions Introduced by Members; Addresses Delivered, (*a*) by Foreign Delegates, (*b*) by American Delegates; Principal Discussions; Address to the Country; National Executive Committee; Organization of the Committee and the Plan of Work for the next Congress.

The discussions cover a wide range of topics on irrigation subjects and the book contains matter of deep interest to all the citizens of the arid States. The proceedings are published by the Los Angeles Chamber of Commerce and extra copies can be secured by sending six five cent stamps, to cover cost of printing and postage, to Fred. L. Allen, Secretary International Irrigation Congress, Los Angeles, California.

MANUAL OF MODERN SURVEYING INSTRUMENTS and their uses, containing useful information for the civil engineer and surveyor, together with a catalogue and price list of scientific instruments, particularly those of the civil engineer and surveyor, made by The A. Lietz Co., 422 Sacramento street. Price fifty cents. This handsome manuel well printed and illustrated should be in the hands of every civil engineer.

A. A. GRIFFING IRON COMPANY'S CATALOGUE has been received, it contains a fine line of steam and hot water heating apparatus. The well known Bundy Radiators are manufactured by this firm. Architects, steam fitters and engineers are invited to apply for copies of this work, which are distributed free to parties interested in the above subjects.

Address 15 Dey street, New York.

REPORT OF THE PARK COMMISSIONERS. The twenty-second annual report for the year ending June 30th, 1893, is at hand, thanks to the kindness of Mr. W. W. Stow, Chairman of the Board of Park Commissioners.

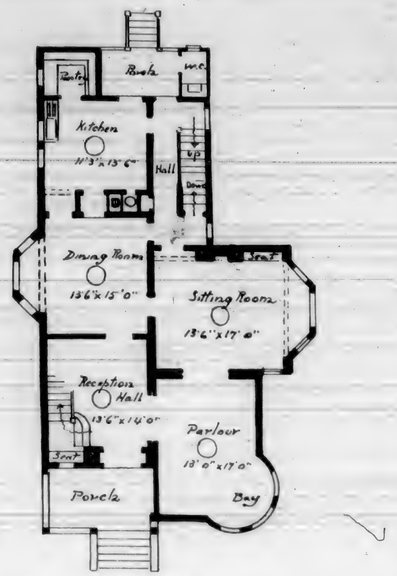
Never since the commencement of work upon the Park has so much been done as in the last year, in the way of improvements of an interesting nature—what with the lake, the waterfall and bridges, to say nothing of the general improvement along the whole line, it must be confessed that the present Commissioners have the knack of making a little money go a long way.

LIPPINCOTT'S MAGAZINE for November, 1893. The complete novel in the November number of Lippincotts is "An Unsatisfactory Lover," by Mrs. Hungerford. It tells in charming manner of an inauspicious wooing and an interrupted courtship, which ends well after all.

THE PHOTOGRAPHIC TIMES announces a Christmas number that will surpass any thing it has yet attempted. The list of the articles that will appear, promises a great diversity of interesting matter, that will be duly enjoyed by both professional and amateur.

RESIDENCE OF MR. WM. FROHLING, SAN JOSE. ARCHITECT W. D. VAN SICLIN.

THE DISPOSAL OF HOUSEHOLD WASTES.—We have here in small compass and at small cost a work by William Paul Gerhard C. E., Consulting Engineer for Sanitary Works, New York, valuable alike to the engineer, and householder, in fact to everyone interested in the promotion of good health and cleanliness; writen in so unpretentious a style and devoid of technicalities that cannot fail to impress the reader that the author understands what he wants to say and knows how to say it in a few words and right to the point—the title page may be given as a sample of what the book is "A discussion of the best methods of treatment of the sewage of Farm Houses, Isolated Country Houses, Suburban Dwellings, houses in villages and smaller towns, and of larges institutions, such as hospitals, asylums, hotels, prisons, colleges, etc., and of the modes of removal and disposal of garbage, ashes and other solid house refuse." Published by D. Van Nostrand Co., New York, for sale by Osborn & Alexander, price fifty cents.



FIRST FLOOR PLAN.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

OPENINGS FOR WINDOWS IN PARTY WALLS.—The owner of land, in building a party wall, partly on his own land, and partly on that of an adjoining owner, has no right, against objections of the adjoining owner, to leave openings for windows therein, to be used until such time as the adjoining owner shall build.

Normile v. Gill, Supreme Judicial Court of Mass. 34 N. E. Rep. 543. 51.

MECHANICS' LIENS ON BUILDING LOTS.—Under the statute giving a mechanics' lien to any person who shall perform labor in altering or repairing any building or building lot, a lien may be had on building lots for grading. A suit to enforce a lien may be maintained though an action is pending for the claim, for which the lien was filed, and for damages for breach of the contract under which the services were rendered.

Raven v. Smith, Supreme Court of N. Y. 24 N. Y. Supp. 601.

LIABILITY OF OWNER FOR NEGLIGENCE OF CONTRACTOR.—Where the owner of premises, whose duty it is to keep the same in repair, contracts with a third person to make the necessary repairs, and he fails to make them, the owner is liable for injuries resulting from the defective condition of the premises, though such third person was an independent contractor.

Brennan v. Ellis, Supreme Court of N. Y. 24 N. Y. Supp. 426. 58.

INTERPRETATION OF CONTRACT.—Where a contractor proposes to contractors to excavate a trench of certain dimensions, under water for a specified sum, the material dredged to be deposited in shore so as not to interfere with said trench, and the latter simply accept the offer, it is not the duty of the contractors to furnish such shore as a place of deposit, and the sub-contractor is not justified in abandoning the contract because the shore inspector prevented him from depositing such material thereon.

Cronin v. Tebo, Supreme Court of N. Y. 24 N. Y. Supp. 644. 82.

PAYMENT OF BUILDING EXPENSES ON ARCHITECT'S CERTIFICATE.—A provision in a building contract for the payment of the builder only on certificates of the architects that payments are due, will not prevent recovery by the builder, when he has fully performed the contract, and the architects refuse their certificates without sufficient cause.

Van Keuren v. Miller, Supreme Court of N. Y. 24 N. Y. Supp. 580. 51.

ENFORCEMENT OF MECHANICS' LIEN IN EQUITY.—The code of 1886, providing that a mechanics' lien may be enforced by bill in equity if the amount involved exceeds $100, is not in conflict with the act giving the circuit court jurisdiction of action to enforce liens of that amount, as there is no inconsistency in giving a remedy in law and one in equity; and the former section is not affected by a section of the latter act, providing for the repeal of all laws in conflict with its provisions.

Colby v. M. E. Church, Supreme Court of Alameda, 13 So. Rep. 515. 90.

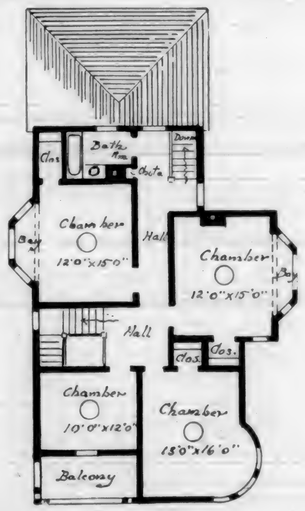
MECHANIC'S LIENS ON HOMESTEAD.—A purchase by a married woman, with the proceeds of the sale of her former homestead, of an unimproved lot, with the avowed purpose of making it the homestead of herself and husband, followed immediately with a contract with a builder for the erection of a dwelling house thereon, is sufficient to constitute the same a homestead; and a material man, who, with knowledge of these facts, furnishes lumber under a verbal contract, to be used in the erection of the dwelling, acquires no lien on the property superior to the homestead exemption.

Cameron v. Gebhard, Supreme Court of Texas, 22 S. W. Rep. 1033. 103.

RIGHTS OF SURETY ON CONTRACTS WHEN ABANDONED BY CONTRACTOR.—Where the surety of a contractor completes the building pursuant to the contract, after abandonment thereof by the contractor, he is entitled to recover from the owner the amount of the contract price, less the amount paid the contractor prior to the abandonment. Where the owner of the building failed to declare the contract forfeited, on its abandonment by the contractor, but permitted the surety to complete the building pursuant to the contract, the surety is entitled to costs in an action against the owner to recover a balance due thereon.

Board of Education of Waterford v. First Nat. Bank of Richfield Springs, Supreme Court of N. Y. 24 N. Y. Supp. 392. 99.

ARCHITECTS CANNOT RECOVER FOR PLANS ACCOMPANYING BIDS.—The mere fact that valuable services are rendered does not raise a liability on the part of him for whom they were rendered, even though at his request, if the circumstances are such as to rebut the inference that compensation was expected to be received or paid; therefore, when the service is performed out of motives of kindness, or in the expectation of a possible benefit to result to the person performing it, in the absence of an express contract, no implied contract can be raised. In the case of architects putting in bids for the construction of buildings, or of engineers for the construction of bridges or other works, and including plans and specifications, unless the parties calling for bids expressly agree to pay for such plans and estimates there can be no contract or promise to pay for them implied, for there is nothing in the circumstances that show that pay was expected to be received or given, except through the possible benefit to the parties performing the service in the acceptance of their bids. Such services are regarded as purely voluntary and gratuitous, unless the plans furnished are made use of, in which event, from their adoption or use, a promise to pay their value would be implied, unless it was provided in the call for bids that such plans or parts of plans might be used gratuitously. 238.



SECOND FLOOR PLAN.

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute of Architects, meets second Friday of each month at 408 California street.
Geo. H. Sanders, Pres. W. J. Cuthbertson, Vice-Pres.
Oliver Everett, Sec. John M. Curtis, Treas.

Technical Society of the Pacific Coast, meets first Friday of each month at Academy of Sciences Building.
C. E. Grunsky, Pres. Charles D. Marx, Vice-Pres.
Otto Von Geldern, Sec. Geo. F. Schild, Treas.

California Electrical Society, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
Geo. P. Low, Pres. C. O. Poole, Vice-Pres.
Max Caspari, Sec. H. T. Bestor, Treas.

GRAPHITE—ITS USES AND DURABILITY AS A PAINT.

An address by John A. Walker, Vice-President of the Joseph Dixon Crucible Co., delivered before the convention of the Master Painters' Association, held July 12th and 13th at Jersey City, N. J.:

"Mr. President and Gentlemen of the Master Painters' Association of New Jersey: I appreciate the honor of this occasion, and have some deference in speaking, as I do at this time, on the subject of paint, after the mode of bringing coals to Newcastle. Possibly every one of you, if you are worthy of the title of master painters, know as much about the subject as I do. Graphite paint is about thirty years old. About thirty years ago graphite was found by some prospectors in the rocks of Ticonderoga, near Lake George. At that time there was formed the agreement of the Graphite Company, and this company was formed exclusively and specifically for the purpose, at that time, of making graphite paint, and this was about twenty-eight or thirty years ago. I saw, two weeks ago, on a visit to Ticonderoga, a piece of machinery lying there that had been painted twenty-three years ago with some paint in an off-hand way, and, except for abrasion made by rubbing against another piece of machinery, to all observation the result of the paint was just as good as it was a dozen years ago.

In the early days, while making their experiments there, certain roofs were painted in the village of Ticonderoga, and observation of the roofs shows they are intact to-day.

Graphite itself is one of the forms of carbon. Charcoal is another carbon form, and the diamond is still another. Graphite has a large number of peculiar qualities. In the first place the graphite itself will stand any change of temperature; it doesn't make any difference how cold the cold is or how hot the heat, the flake of carbon is inert, and suffers no change at either extreme of the temperature. And again, it is indestructable and inert, so that the strongest acids have no effect on it. You can put a piece of graphite in any dilute acid, and after awhile remove it, and you will find no harm has taken place. It is there in its original form, and has not given up any of its properties. The entire piece has remained intact and impervious to that powerful and destructive solution. Made up in this way it has proved to be one of the most valuable of the recent additions to the lines of pigments. It is found in a good many quarters of the globe. The most productive deposits are in the island of Ceylon. The graphite that comes from there is almost all foliated graphite; the flakes come in a granulated form, and these two specimens are the forms of the element as it comes from the island. The largest quantity of graphite used comes from that island. Next in rank as to source of production come Ticonderoga. There is a third source of graphite in the kingdom of Bavaria, in Germany, where a large quantity of amorphous graphite is found mixed with clay and other kinds of minerals, and so intimately mingled that it cannot be separated. The Ticonderoga quartz interposes no difficulty in this respect.

Outside of these three places, graphite is found in Canada; but these deposits have not, or, at least, not very largely, been developed or explored, so no considerable output has come from that territory yet. All over the South specimens have been found, but none of these occurences have proven to have merchantable value. Nine-tenths of all these that have come, so far have been of the amphorous form, in which the impurities could not be separated, so that the debris and graphite have to be ground down together, giving uncertain results.

It occured to the people who had charge at Ticonderoga to work that material up into a paint; but other ideas took up the company's time, and this became a tradition, and that branch of the business was not followed out. Later on, within the last ten years, the graphite paint has been largely manufactured. It has been made a specialty, and its manufacture has been made the subject of careful study. The paint, so far as experience and knowledge of the manufacture goes, has been very useful as applied to roofs, to all classes of bridges, smoke-stacks, boiler fronts, gas holders, machinery in sugar and paper factories, where acids are used in the work. The graphite has proved to be the best anti-acid pigment that could be placed on them, and so on through the line of outdoor iron-work and electric-light poles; and shingle roofs, some remarkable results have been ascertained. Some years ago a Boston and Colorado smelting company, with their works at Argo, in the neighborhood of Eldorado, had their large plant, which was a quarter of a mile long, covered with a corrugated iron roof, and five hundred fires were blazing away within. As the acid rose, the roof was affected, and it was not a great while before it became honeycombed, and it meant protection or a new roof. These people saw some account of the graphite paint and its characteristics in that direction, and they wrote on the subject, received the information desired, and had the roofs painted with graphite paint. Since then those roofs have remained intact, and the only thing that has happened to them in the last fifteen years has been a new coat of paint. The graphite paint was successful in defending the before-victorious attack of the acid fumes. If I recollect, at the convention at Harrisburg last year some statements were made by a man there who had taken observations of roofs, oil-painted, that lasted six to eight years without rusting, and another made a statement of a roof that lasted from ten to twelve years without rusting. Of course we all know that linseed oil is presumably the best vehicle with which to convey the pigment. There may be something better in the future, but up to date the linseed oil is the best vehicle. Mineral oxides, and that class of pigments, are ground down to a powder and deposit themselves on a surface; graphite preserves its flaky character in powder form, so that by the overlapping of these a very thorough covering of the surfaces to be protected is assured. There are a good many qualities to the paint that appear in an off-hand way. Concerning the durability of graphite, there are innumerable testimonials on record in its favor. There is, to my knowledge, a boiler front which was painted in 1885, on Thanksgiving afternoon, and it has not since been repainted, and is in good condition. I remarked to the attendant, or stoker, that the front looked as if it had been repainted recently, but he answered that nothing was done to it since 1885, and he had kept a waste rag, and when the paint got dull he would rub it up with black lead and some oil. The high quality of the paint is shown by its ability to stand the wear and tear of a boiler front, and remain thus, after the lapse of eight years, almost as good as it was the first year.

This is about the sum and substance of graphite paint. There is no doubt it will figure more prominently in the future than it has in the past. One of the handicaps it must bear is the color. Of course, being made of a black pigment, its colors are largely somber. When it comes in its natural form it has a tinge of a natural slate. It can be covered with other materials so that it will become a jet black. Experiments have been recently made by which, by blending other materials, light green and dark green are added to the color; also dark brown and dark red, which will be very likely to produce a good effect.

With one little incident I will close. Some three years ago the iron for the elevated road was made at the Pencoyd Iron Works. The iron for the whole structure was brought to Jersey City and lay there. The work was commenced, and in two months the structure was completed; but six months elapsed before they commenced to operate the road. It had been painted with a mineral paint, and was rusty from top to bottom, and it was necessary to take the rust off. You could pull it off in scales. This work was hurriedly put through by the painters, and the result was when the north and south tracks were up a year they were both painted with graphite paint. With the engineer, Mr. Brooks, I walked the track down to the train shed, and there was not a place on the one side of the track where one could put a knife blade, whereas, on the other side, where it had been painted and not carefully scraped off, and not carefully prepared, the painting was more or less imperfect, and there were large pieces and flakes that came off. The engineer and I went up and down the track, and saw the paint on one side and the blisters on the other side, and he was frank enough to admit that the difficulty lay, not in the paint, but in the application of the paint. The paint as it stood on the south tract stands there to-day, a living evidence of the durability of graphite.—*Manufacturer and Builder.*

BUSINESS MOSAICS.

Among the awards of the World's Fair at Chicago none were more appropriate and deserved, than that to The Bostwick Steel Lath Company of Niles, Ohio, who were awarded the only medal and diploma for Fire-Proof Steel Lath—this lath is too well known to the architects of this coast to need any endorsement of ours, but it is handy to know that Smith & Young, 727 Market street are the agents for the Bostwick Steel Lath Company.

Mr. Flipp—"We havn't see so much of you since your return from the seaside." Miss Dipp—Oh, wait until the opera season opens; you'll see quite as much of me then—perhaps more."—*Town Topics.*

Joseph Budde should not be overlooked when hunting for Sanitary Appliances that are sure to give satisfaction. Householders should not forget the fact that they encourage home industry, at the same time derive the benefit of having a healthy house, with no bad air, when the popular Golden Gate Patent Water Closet is used. A word to the wise is enough.

Farmer's Boy—"There's goin' to be a minstrel show in Pinkington next week. Can I—"

Old Hayseed—"Gee whittaker. It ain't a month sence you went to the top of the hill to see the 'clipse of the moon. D'ye wanter be always on the go?"—*Puck.*

Light Gray Granite in all forms from the Eureka Granite Works in Rocklin, Placer Co., Cal., can be ordered from the agent, E. H. Burrell, 408 California St., room 16—this granite is so well known and like good wine requires no bush.

Young Husband—"Humph! Muddy coffey again, I see." Young wife—Yes; and if you were half the man I thought you were, you would make the city authorities clean the reservoir.—*New York Weekly.*

Coppieters & Mockel, manufacturers of Art Metal novelties in wrought iron, copper and brass, those who intend to prepare a handsome display of their goods in honor of our coming Midwinter Fair, cannot do better than give them a call and order their show windows put in good shape. You will find the works at 23 Jessie street, San Francisco.

Antinonnin—This useful substance is bound to become in favor with the architects on this coast, as it has already, with many architects and builders in the east, as well as in Europe—a preventative of mildew, a preservative of timber, and what the good housekeeper will consider a boon—sure death for fleas. A full description of this new substance will be forwarded on application to W. H. Schieffelin & Co., New York.

Amelia—"Swear not by the moon, the inconstant moon." Augustus—"Then what shall I swear by?" "Swear by that which you hold invaluable; something which is dearer to you than all things else; something that you cannot live without." "Then, Amelia, I love you! I swear it by my salary."—*New York Weekly.*

California Fire Apparatus Works—If you want to reduce your insurance, have packing boxes that never leak and always ready for duty under full pressure of water, call upon W. T. Y. Schenck, 222 and 224 Market street and examine Schenck's Swinging Hose Reel, sold only with the hose, the couplings and hose pipe complete and fully guaranteed.

Tommy (reading)—Here's somthing about a new organ with a hundred stops. Do all organs have stops, papa?" Papa—"Yes, my son, with one exception—your dear mother's organ of speech?"

An exchange editorially endorses in the following words the Pullman Sash Balance:—"The product is all and more than is claimed for it. It is mechanically perfect and accomplishes the desired result in every particular. It is correct in theory and admirable in practical use, satisfactorily fulfilling every demand and requirement. In all respect it is beyond criticism in point of workmanship, superiority of finish, ease of operation, and last but not least, highest durability."

While the Pullman Sash Balance is daily growing in favor with our builders in this vicinity, which fact is proved by the number of jobbing houses in this city that supply the demand, it is pleasing to call attention to the opinion of our eastern friends, to a contrivance that has found such favor with our own people.

CITY BUILDING NEWS.

Belvedere near Waller. To build; owner, Mrs. A. L. Ryder; contractors, White Bros.; signed, Nov. 1; filed, Nov. 1; cost $3,000.

Block bounded by Point Lobos, 5th and 6th avenues and A street. Carpenter, mill work, etc.; owners, La Societe de Benfaisance Mutuelle; architects, Mooser & Goustiaux; contractor, Alex. L. Campbell; signed, Oct. 17; filed, Oct. 18; cost $15,500.

Block bounded by Point Lobos, 5th and 6th avenues and A street. Painting; owners, La Societe de Benfaisance Mutuelle; architects, Mooser & Goustiaux; contractor, J. F. Sullivan; signed, Oct. 17; filed, Oct. 18; cost $3,075.

Block bounded by Point Lobos avenues and A street. Electric bells, etc.; owners, La Societe Francaise de Benefaisance; architects, Mooser & Goustiaux; contractor, Lat. E. Allen; signed, Oct. 17; filed, Oct. 18; cost $375.

Block bounded by Point Lobos, 5th and 6th avenues and A street. Plumbing, gas fitting, tiling, marble, sewers and sewerage; owners, La Societe Francaise de Benfaisance Mutuelle; architects, Mooser & Goustiaux; contractors, S. Ickelheimer & Bros. signed, Oct. 18; filed, Oct. 18; cost $9110

Block bounded by Point Lobos, 5th and 6th avenues and A street. Brick work, cement, plastering and cast iron work; owners, La Societe Francaise de Benfaisance Mutuelle; architects, Mooser & Goustiaux; contractors, Worrell & Miller; signed, Oct. 17; filed, Oct. 18; cost $47,039.

Block bounded by Point Lobos, 5th and 6th avenues and A street. Excavating, concrete, artificial stone work and cementing; owners, La Societe Francaise de Benfaisance Mutuelle; architects, Mooser & Goustiaux; contractors, Feeney Bros.; signed, Oct. 17; filed, Oct. 18; cost $25,855.

Brannan near 2d. Excavating, concrete, etc., and alterations; owner, Del Monte Milling Co.; contractor, Casper Zwierlein; signed, Oct. 24; filed, Oct. 27; cost $1575.

Bush and Larkin. Plumbing, etc.; owners, Olympic Salt Water Co.; architect D. Ernest Melliss, engineer; contractors, Duffy Bros.; signed, Oct. 20; filed, Oct. 20; cost $9,300.

Bush and Gough. Marble work; owners, Trinity Church; architect, A. Page Brown; contractors, W. W. Montague & Co.; signed, Oct. 27; filed, Oct. 31st; cost $3,000.

Bush and Gough. Pews, etc.; owner, Trinity Church; architect, A. Page Brown; contractors, Fink & Schindler; signed, Oct. 27; filed, Oct. 31; cost $4,500.

California near Drum. Concrete, marble and iron work; owner, Luning Co.; architects, Coxhead & Coxhead; contractors, Rullino & Bianchi; signed, Oct. 5; filed, Oct. 18; cost $3271.50.

Capp near 23rd. All excavation and work to build; owner, F. Gries; architects, Martens & Coffey; contractors, Schutt & Krecker; signed, Oct. 16; filed, Oct. 17; cost $4600.

Capp near 22d. All work to build; owner, John Fitzgerald; architect, M. J. Welsh; contractors, R. Doyle & Son; signed, Oct. 23; filed, Oct. 24; cost $3,379.

Clement near 6th Ave. One story frame; owner, Floyd J. Mynard; architect, James Mix; contractor, Robert Murray; signed, Oct. 27; filed, Oct. 28; cost $1199.

Eighteenth and Castro. To build, except painting and gas-fitting; owner, C. Reusche; architect, Emil John; contractor, W. A. Muller; signed, Oct. 26; filed, Nov. 1; cost $3,825.

Fell near Steiner. To build; owner, Nathan Cohn; architects, Pissis & Moore; contractors, Roundtree Bros.; signed, Oct. 26; filed, Oct. 31; cost $5474.

Fifth Ave. near Fulton. Two-story frame; owner, Mary Rakeman; contractors, Home Building Co.; signed, Oct. 20; filed, Oct. 23; cost $2350.

Fifteenth near Howard. To build; owner, F. N. Neavol; architect, Chas. M. Rousseau; contractor, Geo. R. Breese; signed, Oct. 20; filed, Oct. 23; cost $975.

Fourth near Folsom. Excavating and building; owner, John Demartini; architect, Wm. Mooser; contractor, John J. Dunn; signed, Oct. 11; filed, Oct. 13; cost $5,000.

Folsom near 22d. Two-story frame engine house; architects, Henriksen & Mahoney; contractors, R. Doyle & Son; signed, Oct. 4; filed, Oct. 20; cost $6249.

Folsom near 13th. Alterations and additions; owner, James O. Manlon; architects, Shea & Shea; contractors, Conton Bros.; signed, Oct. 30; filed, Nov. 1; cost $1,920.

Florida near 25th. Additions and alterations; owner, Edward Fennsesey; architect, T. J. Welsh; contractors, Wm. Schaffeld & Son; signed, Nov. 3; filed; Nov. 9; cost $1,247.

Golden Gate Park. To build; owners, Chinese Midwinter Fair Co.; architects, Martens & Coffey; contractor, R. M. Murry; signed, Nov. 4; filed, Nov. 10; cost $12,800.

Golden Gate Park. Administration building owner, Ex. Com. Cala. Midwinter Fair; architect, A. Page Brown; contractor, A. P. Antonelli; signed, Oct. 18; filed, Oct. 23; cost $30,474.

Golden Gate Park. Chocolate Cafe; owner, Johnson, Lock Mercantile Co.; architect, Samuel Newsom; contractor, Richmond Sinnott; signed, Oct. 24; filed, Oct. 28; cost $2700.

Gough and Vallejo. Painting; owner, L. P. Barnard; contractor, W. R. Eaton; signed, Oct. 19; filed, Oct. 23; cost $1190.

Guerrero near 19th. Two-story frame and one-story frame stable; owners, Thomas and Alice Flinn; architect, Chas. J. I. Devlin; contractor, R. O. Davis; signed, Oct. 10; filed, Oct. 12; cost $2850.

Hattie bet. 17th and 18th. Raising a one-story cottage to make two-story flats; owner, Margaret O'Conner; contractors, Douglass & O'Conner; signed, Oct. 25; filed, Oct. 27; cost $1150.

Hayes near Webster. To build; owners, Otto and Emily Friendlander; architect, H. Gilfuss; contractors, Schutt & Krecker; signed, Oct. 17; filed, Oct. 17; cost $6200.

Hayes and Lyon. Plumbing and gas service, etc. owner, I. V. Tadich; architect, T. J. Welsh; contractor, G. C. Sweeney; signed, Oct. 14; filed, Oct. 20; cost $1088.

Kentucky bet. Solano and Butte. Carpenter work, plumbing, painting, etc.; owner, Matthew Lunner; contractor, Edward Mooney; signed, Oct. 16; filed, Nov. 1; cost $2,565.

Lott near McAllister. Two-story frame; owner, Mary I. Coddington; contractor, W. W. Redneil; signed, Oct. 20; filed, Oct. 20; cost $5500.

McAllister near Jones. Brick and iron work; owners, Katherine Adam and Eliza Kibbe; architect, Julius E. Krafft; contractor, D. J. Brenan; signed, Sept. 15; filed, Oct. 16; cost $5500.

McAllister near Jones. Painting, graining, varnishing and finishing two-story brick; owners, Katherine, Adam and Eliza Kibbe; architect, Julius Kraft; contractor, J. H. Killer; signed, Oct. 18; filed, Oct. 21; cost $1100.

McAllister near Jones. Lathing and plastering; owners, K., A. and E. Kibbe; architect, Julius Kraft; contractor, T. Murphy; signed, Sept. 15; filed, Oct. 16; cost $2550.

McAllister near Jones. Plumbing, etc.; owners, K., A. and E. Kibbe; architect, Julius Kraft; contractor, Jas. E. Britt; signed, Sept. 15; filed, Oct. 16; cost $2483.

Mason near O'Farrell. To build; owner, Marten O'Dea; architect, Chas. I. Havens; contractor, John Furness; signed, Nov. 8; filed, Nov. 8; cost $6,700.

Oak near Devisadero. To build; owners, City and County of S. F.; architects, Henriksen & Mahoney; contractors, D. Doyle & Son; signed, Oct. 4; filed, Oct. 20; cost $5405.

O'Farrell near Webster. Three-story frame; owner, Solomon Michael; architect, A. J. Barnett; contractors, Peterson & Olson; signed, Oct. 18; filed, Oct. 19; cost $5000.

O'Farrell near Octavia. Masonry, etc.; owner, Geo. Haas; architect, J. H. Littlefield; contractor, Jos. Kennedy; signed, Nov. 6; filed, Nov. 7; cost $7,283.

O'Farrell near Octavia. Sewerage, etc.; owner, Geo. Haas; architect, J. H. Littlefield; contractor, G. C. Sweeney; signed, Nov. 6; filed, Nov. 7; cost $1079.

O'Farrell near Octavia. Painting, etc.; owner, Geo. Haas; architect, J. H. Littlefield; contractor, Gus. N. Daniels; signed, Nov. 6; filed, Nov. 7; cost $314.

O'Farrell near Octavia. Artificial stone; owner, Geo. Hass; architect J. H. Littlefield; contractor, F. W. Schalike; signed, Nov. 6; filed, Nov. 7; cost $406.

Page near Cole. One-story frame with brick foundation; owner, J. F. Sarber; architect, W. H. Lillie; contractor, R. M. Murray; signed, Oct. 12; filed, Oct. 14; cost $1035.

Pacific Rolling Mills. Owner, Pacific Rolling Mill Co.; architect, Patrick Noble; contractors, Healy, Tibbetts & Co.; signed, Oct. 25; filed, Nov. 6; cost $6.75 for each pile driven.

Post and Leavenworth. Brickwork, etc.; owners, San Francisco Verein Ass. architects, Saffield & Kohlberg; contractor, Adam Beck; signed, Nov. 7; filed, Nov. 9; cost $18,796.

Post and Powell. Carpenter work, etc.; owner, Mrs. A. M. Parrott; architects, Pississ & Moore; contractor, F. W. Kern; signed, Oct. 26; filed, Nov. 1; cost $34,500.

Post and Powell. Cast iron work; owner, Mrs. A. M. Parrott; architects, Pississ & Moore; contractors, O'Connell & Lewis; signed, Oct. 27; filed, Nov. 1; cost $8,500.

Post near Stockton. Brick building; owner, V. Menesino; architect, Chas. R. Wilson; contractors, Leibert & Hoffman; signed, Nov. 1; filed, Nov. 4; cost $5,849.

Post near Stockton. Excavation, etc.; owner, V. Menesino; architect, Chas. R. Wilson; contractor, W. T. Ambrose; signed, Oct. 13; filed, Oct. 17; cost $1770.

Post and Powell. Grading and trenching; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, J. I. Rauer; signed, Oct. 20; filed, Oct. 20; cost $1275.

Strawberry Hill in Golden Gate Park. One-story and attic boat house; owners Golden Gate Park Commissioners; contractor, Geo. H. Walker; signed, Oct. 10; filed, Oct. 14; cost $994l.

Twenty-third near Hampshire. Four two-story frames; owner, Peter Kelly; architect, Wm. H. Armitage; contractor, Geo. Weismann; signed, Oct. 26; filed, Oct. 28; cost $5100.

Union bet. Octavia and Laguna. Two-story frame, alterations; owner, F. G. Bacigolupe or T. N. G. Bacigolupi; architects, Chas. Beasley and Son; contractor, Devoto & Sunder; signed, Oct. 3; filed, Oct. 13; cost $4400.

Washington near Baker. Two-story frame engine house; owner, City and County of S. F.; architects, Henriksen & Mahoney; contractor, W. S. Wickersham; signed, Oct. 4; filed, Oct. 25; cost $4880.

Webster near Pine. Carpenter, etc.; owner, Jacob Clauss; architect, Wm. H. Wharff; contractors, Brobeck & Hickox; signed, Nov. 7; filed, Nov. 7; cost $1851.

THIS journal is prepared to take charge of rendering perspective drawings in pen and ink or color. Charges will depend on size and kind of drawing wanted.

Upon receipt of plan and elevations, with a description of what is wanted, we will submit our estimates for the performance of the work.

SINCE work was begun in September on the exhibition buildings for the California Midwinter Fair, up to the date of this writing, there has not been more than two or three days when the weather interfered with the progress of the work, on the contrary the clerk of the weather has been very favorably disposed, and has granted every requirement to the busy workers, who are now completing a veritable city where naught but barren sand hills existed three months ago.

THE ever recurring troubles of the unemployed are again claiming the attention of the public, not only in this State, but through the entire country and Europe. The distress is general and widespread, without taking into consideration the tramp, and the discontented element that continually looks for work without the desire to find it.

Governments that boast of their advanced state of civilization, and yet have provided no means for the suppression of the tramp nuisance, and no remedy for the voluntary or involuntary idleness of its destitute citizens, both evils that threaten to become menacing dangers to the peaceful existance of society, have certainly failed to satisfactorily solve one of the most important questions they were organized to deal with; for the existance of masses of idle discontented human beings, is a continual threat to the peace and quiet of the social fabric. Society as it becomes more complex, presents ever increasing difficulties to the unemployed to secure remunerative employment. The continuous struggle that exists between the majority of employers and the majority of employees, has a tendency to reduce wages in times of depression, without a correspondingly great tendency to increase them in times of plenty.

Now it is self evident that a danger to society becomes apparent when the rate of wages falls to the point where

they are too small to supply the necessaries of life; and also self evident that in a well regulated social state there should be no valid excuse for idleness and destitution; when the oppression of the upper classes becomes to severe to be borne, the masses overturn the existing state, and seek to inaugurate a better; but they fail from ignorance, where their rulers failed from greed. Before the case comes to this crisis; it is well to look into the matter, and endeavor to find a satisfactory solution of the problem.

In studying the question these two facts are brought to the attention of the student with great distinctness.

First—There is a certain amount of idle labor that seeks employment.

Second—There is ever an immense amount of work that needs to be done to satisfy the wants and increase the ease, comfort and enjoyment of society, both individually and collectively.

As long as these two conditions exist (and they always will exist) it simply remains to find the most advantageous way of making them neutralize each other. As long as the efforts of individuals are sufficient for the accomplishment of this object, well and good; when individual efforts becomes insufficient, it is time the collective efforts of the individual, that is to say the government, should step in and by appropriate legislation supply the deficiency. How this may best be accomplished is not an easy question to satisfactorily answer; we shall make some suggestions in a future article.

THE Executive Committee of the American Foresty Association, report that the work of the association is at last beginning to be effective.

Not only has the policy of reserving public timber land for forestry purposes, established by the last Administration, been recognized by the present Administration—in reserving some 4,500,000 acres more (the Cascade Range and Ashland Timber Reserves in Oregon), making the total acreage in forest reservations nearly 18,000,000—but there is ground for hope that some rational legislation for protecting and utilizing these reserves may be enacted, thanks to the warm interest and energetic work of the Hon. Thos. C. McRae, of Askansas, Chairman of Public Lands Committee.

BEQUESTS FOR A HOSPITAL.

A notable instance of private generosity for philanthropic purposes is brought to light by the filing for probate the will of the late Mrs. Kate Johnson.

The full third of her estate, the entire amount allowed by law for charitable purposes, has been bequested for the erection, endowment and maintenance of a free hospital for all sick women and children, without regard to religion, nationality or color.

In the petition for the probate of the will the value of the estate is given nominally as $1,000,000, and its income at $4,500 per month, but the real value will probably approximate $2,000,000, so the one-third bequested to the free hospital will not fall far short of $700,000.

The clause in the will having particular reference to the proposed hospital is as follows:

I give devise and bequeath to Archbishop Patrick W. Riordan of San Francisco, California, all my pictures and valuable bibelots; also all that certain real property situate in the city and county of San Francisco, state of California, and described as follows, to wit: Horner's addition blocks numbered 173 and 174, bounded on the north by Twenty-ninth street, on the east by Castro street, on the south by Thirtieth street and on the west by Diamond street; also, my new warehouse known and designated as the Gibraltar Warehouse and the lot on which the same is situated at the southeast corner of Sansome and Filbert streets; also, such a sum of money as will, with the real and personal property aforesaid, comprise one-third of my entire estate; all of the same to be held in trust by him to and for the uses, intents and purposes following, that is to say:

THE FOUNDING OF THE HOSPITAL.

It being my desire to found and endow a free hospital to be located in said city and county of San Francisco; all said money and property is to be by said trustees paid, conveyed and delivered over to a corporation to be hereafter formed by a society to be composed of the Roman Catholic Archbishop of San Francisco and R. C. Tobin, Dr. C. F. Buckley, Dr. W. S. Thorn and Dr. Luke Robinson, or the survivors of them, and such other persons as they or their survivors and successors, in their discretion, shall elect to fill vacancies in said society; said corporation to be formed under the laws of the State of California; the name of said corporation to be Mary's Help Hospital; the purposes for which such corporation shall be formed to be to receive endowments and acquire property for and establish, erect, maintain and conduct a free hospital for all sick women and children of the poor, without regard to religion, nationality or color, excepting such as the officers of the hospital consider dangerous to other inmates; such hospital to be conducted by the Roman Catholic Sisters of St. Vincent de Paul, commonly called the Sisters of Charity, under the direction of the Board of Directors of said corporation.

The place where the principal business of said corporation shall be transacted shall be the city and county of San Francisco, State of California, and the number of its Directors shall be five; and I direct the said trustee, Archbishop Patrick W. Riordan, to pay, convey and deliver over to such corporation when so formed all of the money, property and estate aforesaid. It is my wish that the Roman Catholic Archbishop of San Francisco be a member of said society and ex-officio one of the Board of Directors of said corporation, and that the others of such Directors shall at all times consist of one business man and three physicians, and that the medical staff of the hospital shall have the right to give clinical instruction in the hospital to students and graduates of medicine.

THE CITY HALL TOWER.

THE above question will be settled at last by the adoption of a design for a dome surrounded by tiers of colonnades.

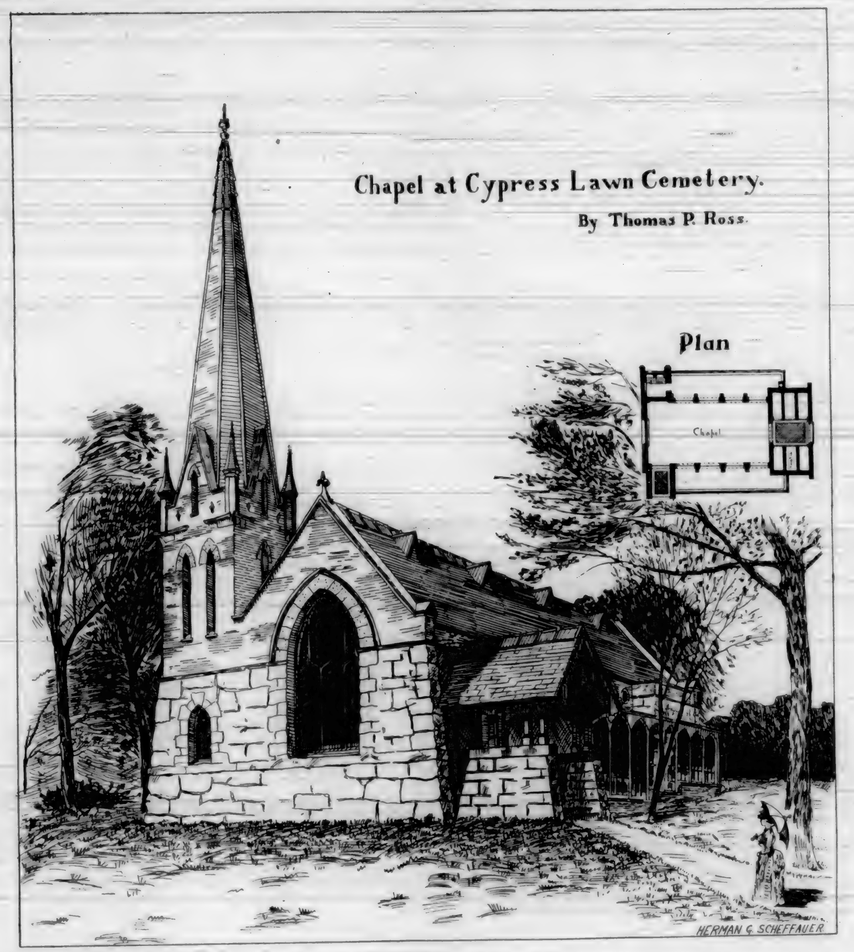
Mr. Frank Shea, the architect of the Board of New City Hall Commissioners has prepared the preliminary drawings and the specifications for the completion of the central feature that is to crown the front of this edifice and in submitting them to the Board made the following statements:

"The specifications of the copper, cement and interior decoration work have not yet been prepared, as I thought it wise to defer their compilation, because many months will elapse before the work will be required. The general plan of construction of the dome consists of a complete frame of metal, commencing at a line on top of the present circular brick wall and interior columns. The entire upright frame, except that portion resting upon interior columns, will be encased in brick and terra cotta walls cemented on the outside, in order that the character of the work of the present building may be maintained. The dome will be covered with copper. The specifications have been prepared separately, so as to permit the receiving of bids, or estimates, upon the work in part or as a whole, and the time set for completion of all the contracts is July 28, 1894.

"I have spared neither time nor labor in the study of the construction of the dome, and I feel confident that in the plans presented the best results possible from a practical and esthetic point of view have been attained, and that, when completed, the New City Hall will be surrounded by a dome in perfect harmony with the great building at its base.

"I have estimated the entire cost at $300,000. It will take twelve months to complete the dome with due haste. The work will give immediate employment in the shops, yards and on the ground proper to 600 men, and continual employment to at least 350 workmen."

The plans have been examined by the Board and accepted and now all that remains is to take bids and start the work immediately.



THE OPENING ADDRESS TO THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

DELIVERED BY THE PRESIDENT, J. MACVICAR ANDERSON, AT THE FIRST GENERAL MEETING, MONDAY, 6th NOVEMBER 1893.

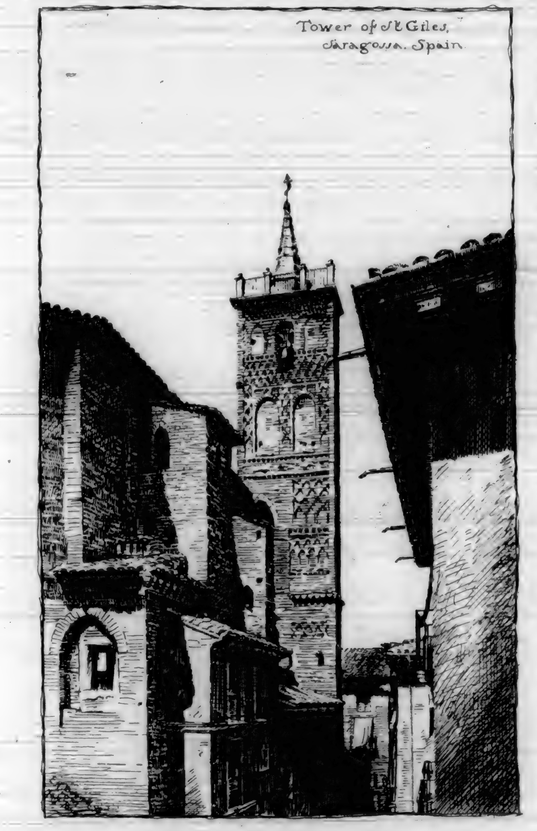
Colleagues and Gentlemen:

THOSE of you who were good enough to honor me with your presence at the opening Meeting of last session may remember that the keynote which pervaded the Address it was then my privilege to deliver was Progress, and from that standpoint I noticed some subjects of professional interest. Progress leads to Attainment, and it is therefore a natural sequence to pass from the means to the end, and from the higher platform to review some points that may be supposed to interest the architect, and less directly the public.

No one who regards life as a serious reality fails to set up some goal, in the attainment of which life is passed. The goals of some wither with possession—the object is too material, attainment too easy. The noblest, as well as the happiest, lives are passed in the pursuit of an ideal, the standard of which is so lofty that it is never fully attained. Point after point may be gained, each one higher than the last; but, as with the Alpine climber, ever in front is displayed the as yet unattained excelsior of excellence, which for the architect is enshrined in Truth and Beauty. And so it comes to pass that in such aspirations the oldest men are still students, because their ideal of excellence is so lofty that

life is too short to attain it. But, just as the highest life is sustained and inspired by Hope, which can alone find full fruition hereafter, so the life of the artist is ennobled by the yearning for the attainment of excellence, which no disappointment can extinguish, and no success can satisfy. This is the Art life worth living.

Architects, however, are sometimes reproached with incapacity because they fail to attain an ideal which the public choose to establish. Such reproach has often been cast at the architects of this century because they have not created



what is called a new style of architecture. No indication is vouchsafed of what is meant by those words, probably because no reflection has been bestowed on the subject. It is sufficient to censure a body of educated men by accusing them of want of originality, and of slavishly copying the works of others. In order to meet the accusation, it is necessary to apprehend what architecture is. When men began to multiply on the face of the earth, when they had to work, when they founded communities, when they erected buildings to provide for their necessities, and when such buildings were constructed with regard to beauty of form and proportion, architecture was born. Thus, architecture is the product of the necessities of life coupled with the aspiration for the beautiful. The development of this germ has found expression in the buildings, monuments, and shrines of succeeding generations; and what are known as styles of architecture are simply the adaption of this germ to climatic influences and conditions of life in different parts of the world. With the modification of such conditions they become subject to variation. Thus, the architecture of feudal times, when warfare, was the rule, not the exception, was characterised by massive solidity, unbroken wall-space, diminutive openings, and bald simplicity. Such characteristics, necessitated by the hardy severity of a warlike age, would obviously be ill adapted to the advanced civilization and luxurious refinement of these days of peace and accumulated wealth; and so solidity gives place to lightness, wall-space to fenestration, simplicity to ornamentation.

If, then, architecture is the outcome of actual conditions of life, it follows that to create a new style is beyond the power of any individual or any body of architects, no matter how bountifully he, or they, may be endowed with the power of original design. Are the conditions of life in our day distinctively different from those which prevailed in the days of our fathers? Our climate, much as it is abused—and, as I think, unjustly—remains much the same. We eat, we drink, we work, we sleep, we marry and are given in marriage, and in all essential conditions we live and die as our ancestors have done before us. Is it, then, reasonable to anticipate the advent of a new architecture? Cause and effect are inseparable. With new conditions of life, a new architecture will be called into existence; but so long as the conditions of national life remain unchanged, it is as absurd as it is illogical to traduce the architects of this age for having failed to attain to the creation of a new style of architecture.

But it is alleged further that our system of education, and, resulting from that, our programmes of examinations, tend to rivet the chains that bind and restrict us to the past; that we inculcate the study of schools of architecture which were called into being by conditions that no longer exist; that we teach forms and proportions defined by masters in such schools, which were beautiful because appropriate to the conditions of life in their day, but which are not appropriate, and therefore not beautiful, now; that we encourage the student to paraphrase Greek, Roman, Romanesque, Gothic, Saracenic, Renaissance, Hindoo, Burmese, Siamese or Chinese art; that historic styles have nothing to do with architecture; that English Composition, Geography, History, Latin, French or German, have no connection with it—in a word, that we look on the essential as unimportant, though most rigorously insisting on what is of no use. Instead of this, we are told that we should inaugurate a system of education and examination that would not disturb the oblivion of the dead past, but that would tend to develop native power by encouraging students to realize the actual requirements of a living age, and to design forms and proportions such as may be best adapted to them; that if we want to test real progress we should see what students can make of a story-post, a cast-iron column, a wrought or cast iron girder; how they can adorn a door or window, or group them; if they can light efficiency or æsthetically when light is only wanted to produce a mental impression; or if they know what forms and proportions are good for sound.

In this and in all such representations there is, no doubt, much that is plausible and calculated to attract and captivate the unthinking; nay, more, there is much in which we cannot but concur. We all desire to encourage and to develop original power. It is inevitable that those who cherish the architecture of a past age to which they are passionately devoted, and which in their judgment is not inapplicable to the wants of the present day, should exercise an influence on their pupils and assistants in the direction of their preference; but it by no means follows that preference for forms or features which a past age admired and practised restricts the development of native power. Is it not apparent that

such representations as I have referred to rest on a fallacy? The inferred assumption is that originality may be the product of education. Now, individuality—that which educes original work, instead of reproducing the work of others—is a natural endowment which education and examination can neither create nor smother. That it is rare is demonstrated by the fact that in Art, as in other callings, the possessor secures a following, and founds a school. The majority of men are only too willing to follow where one master-mind leads. The fact of having studied and been imbued with admiration for proportions and forms which are the legacy of a past generation will not prevent originality from finding expression; nay, it is certain that creative power will in no sense be injured, but rather refined, by the study of beautiful forms and chase proportions attained by past masters of the art, and by the principles on which such forms and proportions were based. If it be true that Latin and History have no connection with Architecture, it is in the same sense true that the dead languages have no connection with the life's work of most of those who are taught them; but experience has proved that such teaching is the best possible mental and educational foundation on which to rear the work of life; and it would be as absurd to banish the teaching of Latin or Greek from our schools, as to exclude a knowledge of Latin, French, German or History from the education of architectural students. The more highly educated our students are—not merely in technical training, but in respect of general attainments and a familiar knowledge of the past—the better will it be for the future of architecture. Sir Joshua Reynolds has well said: "He who is acquainted with the works which have pleased different ages and different countries, and has formed his opinion on them, has more materials, and more means of knowing what is analogous to the mind of man, then he who is conversant only with the works of his own country." In the same relation, the gifted President of the Royal Academy addressed to students words as eloquent as they are true when he asked them "to believe that the gathered experience of past ages is a precious heritage and not an irksome load, and that nothing will better fortify them for future and free development than the reverent and the loving study of the past."

And if it be right that the education of architectural students should be not merely technical but liberal, does it not follow that an examination which is established for the purpose of testing the knowledge which they ought to possess should be co-extensive? The range of subjects embraced in the study of architecture is wide, because there are so many cognate subjects of which it is essential to know something; and, further, because it is desirable that the professor of a Fine Art should not merely be technically an expert, but that he should be also a man of refinement and culture. I have little sympathy, therefore, with the carping criticisms that occasionally reach me respecting the details of our scheme of examinations. The experience which can alone be acquired by time will no doubt lead to the modification of some, or the expansion of other features. No one has been so foolish as to claim perfection for a scheme which is as yet in its infancy. I confess, however, that to my mind the fact that there has been so little to remedy, and that the scheme has already met with so large a measure of success, speaks volumes for the wisdom and the enlightened foresight of the Board of Examiners and of their Chairman. Some of you, indeed, have thought—and I confess to have sympathized with you—that too little prominence has hitherto been attached to the subject of Design; but the Board of Examiners have evinced their desire to meet any legitimate objection by extending, as they have now done, the time to be devoted to this important subject from six hours to two entire days out of the six days to be occupied by the Final Examination, as compared with half a day to be given up to History, Architecural Features, Hygiene, Materials, Construction and Specifications and Professional Practice, respectively, the sixth day being devoted to the Oral Examination. This is a change for the better, which will no doubt be appreciated by students, and which meets with my entire concurrence. I should, however, deplore any undue limitation in our Progressive Examinations in respect of literary or historical subjects, which are not only of vast utility in themselves, but are essential elements in the equipment of one who aspires to be qualified as an architect to take his place with men of education and learning.

It is alleged, as I have said, that the architects of our day are devoid of originality because they have not created a so-called new style of architecture, and that our system of education and examination is defective because it restricts the encouragement of native power and rivets the chains that bind us to a dead past. Let the tree be judged by its fruit. If these allegations be true, the result would be apparent in the architecture of the day, which should be tame, insipid—a slavish reproduction of dead forms and proportions, devoid alike of interest and of life. Is it so? I am not expressing approval of all contemporary works; but I have no hesitation in asserting that, whatever may be said by adverse critics, our architecture exhibits characteristics the reverse of these.

In point of material, the contrast with the past is striking, whether we like or dislike the free use of terra cotta, marble or faience, that is so much in vogue; while in respect to Design, I challenge any impartial observer to find precedents for many modern buildings, which seem to sparkle with the impress of novelty. To quote illustrations from the works of living architects would be invidious, but many examples will occur to you which exhibit remarkable ability and originality on the part of their authors. I conclude, therefore, that the allegations to which I have referred—although occasionally emanating from those whose position entitles their opinions to respect—are groundless, and are refuted by the attainments of contemporary architects, whose works, whether we admire them or not, are the expression, not of a dead art, but of life and power.—*Journal of the Royal Institute of British Architects.*

ILLUSTRATIONS

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

THE Bohemian Club Building on the corner of Sutter and Mason streets is by Pissis & Moore, Architects.

A sketch for a tower is by Willis Polk, Architect.

FILMORE street, two dwellings by Martens & Coffey, Architects.

OPENING THE TRADE SCHOOLS.

THE New York Trade School, founded by the late Col. Auchmuty, began its thirteenth season Monday evening at its buildings, First avenue and Sixty-seventh street. The classes in bricklaying, plumbing, carpentry, house painting, stone cutting, fresco painting and blacksmith's work opened at seven o'clock Monday evening, while the class in plastering will not begin till December 11th. The day instruction in plumbing, house and fresco painting, sign painting, bricklaying and carpentry will not begin till January 1st. The course in printing will be started, however, on November 13th.

The school has every reason to feel assured of increased success this year. It is expected by the assistant secretary, H. V. Brill, that there will be fully 550 students in attendance on the various courses, an increase of seventy-five over last year. Mr. Brill said that the increase would be even greater were it not for the effects of the present financial stringency.

As to the courses, there will be no essential changes in the conduct of any of them. The class in plumbing is by far the largest attended, over 200 registering in that alone last year. Mr. Brill expected that the class in printing, which was begun last year, and is consequently the latest addition to the curriculum, would probably show a greater relative increase than any.—*Architecture and Building*.

SPURIOUS HARDWARE.

SOME of the leading hardware merchants of Toronto complain that duplicates of some of the more favored and expensive patterns in American hardware are being manufactured in cast iron in Toronto, and after being plated are placed on the Canadian market, represented to be the genuine article. At first appearance the spurious goods are a good copy of the genuine and can be detected only by very careful examination. To make detection still more difficult, a genuine lock is often used with a conterfeit escutcheon. A close inspection will usually reveal that the counterfeit article, while perhaps identical in color, is slightly smaller in size than the genuine. This is due to shrinkage in casting, in the process of which one of the genuine articles is used as a pattern. The genuine article is made of bronze metal, which to a considerable extent is impervious to the action of the atmosphere. The imitation is as we have said made of cast iron, and will retain its appearance at the longest only a few months. The importers of expensive American hardware claim that they should not be placed in competition with a spurious article which can be produced at a tithe of the cost of the genuine. If architects are satisfied with cheap goods they are quite willing to compete on that line, but they should not be expected to place a genuine article in competition with one to which the same name and appearance have been given, but which is counterfeit. Architects would do well to enquire into this matter.—*The Canadian Architect and Builder.*

THE FRANKLIN TRADE SCHOOL.

BENJAMIN Franklin, in his will, gave the citizens of Boston, Mass., in 1791 the sum of £1000, which he directed to be loaned in sums at five per cent interest to young married artificers of good character, under the age of twenty-five, who had faithfully served an apprenticeship in that city. Dr. Franklin estimated that the £1000 would increase in 100 years to £131,000, and then the managers of the fund were to lay out in some public work £100,000, the balance continuing on interest for another 100 years. The whole sum will then revert to the people of the city of Boston and the State of Massachusetts. The trustees under the will are the Selectmen (now the Board of Aldermen), united with the ministers of the oldest Episcopal, Congregational and Presbyterian churches in Boston.

The 100 years having expired, a meeting of the Franklin trustees was held on November 10th, to decide on the appropriation of the available money, amounting to some $415,000. Out of twenty-seven suggestions for its disposition, it was finally decided by vote that the whole amount should be devoted to the purposes of one object, and that object the establishment of a trade school, pure and simple. It was further agreed that the school is to be an independent one, unconnected with the public schools, and that it shall bear the name of the famous donor. This disposition of the fund seems particularly fitting and in harmony with the desire of Dr. Franklin, and the action of the trustees has met with general approval. It is proposed to combine in this school the experience of similar undertakings in the country, and an effort will be made to establish the institution on such lines as will secure the greatest possible benefit to "the young mechanic." It is thought that the New York Trades School, founded and maintained by the late Col. Richard T. Auchmuty, will be the example which will have the greatest weight with the trustees of the Franklin school. Those who are most prominently connected with the educational interests of Boston are wholly in accord with the proposed school, and have commended the movement as certain to fill a need that the city has long felt. The first steps towards the erection of a building for the schools was taken on November 10th, at a meeting of the City Architect, President of School Board, Corporation Counsel and the trustees of the fund. In his last annual report to the trustees the treasurer made the following statement of the condition of the fund February 1, 1893:

Amount of fund February 1, 1892	$398,841.51
Interest accrued during the year	15,958.02
Amount February 1, 1893	$414,799.53
This amount consists of:	
Deposits in Massachusetts Hospital Life Insurance Company	$411,100.38
Deposits in Suffolk Savings Bank	3,489.02
Cash	.13
Balance of bonds, for loans	210.00
Total	$414,799.53

In an editorial on improvements in electoral methods, the *Examiner* has the following:

It is manifest that the party system, under present conditions, is inconsistent with true democracy. The people do not rule, except possibly in one thing at a time. To have their way in that one thing they must give their agents power to thwart them in everything else.

The imperfections of the present political methods could be remedied by two devices, the referendum and proportional representation. It is unfortunate that the advocates of these reforms do not always work in harmony. They should not exclude, but supplement one another. The referendum can never supersede representative legislative bodies, and proportional representation can never make a legislative body so good, wise and responsive to all the complexities of public opinion, as to dispense with the need for the referendum. But both together would give us an ideal political system, would destroy bossism and the rule of party machines, would eliminate bribery, disarm corrupting corporations, and enable the people to express their will on each subject by itself without entanglements with any other.

Proportional representation was made the subject of one of the World's Fair congresses, participated in by a number of the leading thinkers of the country. Various plans were discussed, some recognizing parties and some ignoring them, but the most promising of all seems to have been the Hare Preferential system, now in operation in the elections for Trustees of the Mechanics' Institute in this city. By this scheme all necessity for party organization is dispensed with. Candidates are elected in groups, each voter having a right to name as many as he pleases in the order of his preference, but his vote being counted for only one. The total number of votes cast is divided by the number of places to be filled, and the result is the quota which each candidate must reach to be elected. In an election for Supervisors in San Francisco, for instance, there would be twelve places to be filled. If there were 60,000 votes cast, each candidate would have to receive 5,000 votes to be successful. The first-choice votes would be counted first. Any candidate who received more than his quota of these would be declared elected, and the surplus transferred to other candidates, according the preference expressed on each ballot. If an elector voted for Smith as first choice and Brown as second, and Smith proved to be elected without his help, his vote would go to Brown. If the quotas were not all filled in this way the candidates receiving the smallest number of first-choice votes would be successively eliminated, and their ballots counted for the highest in order of preference. This process would be continued until there were no more candidates left than there were places to be filled, when all the survivors would be declared elected.

If this plan had been in force at the last election the present Board of Supervisors would have consisted of the most popular men on the Democratic, Non-Partisan and Republican tickets. In the same way the Congressional delegation of a State could be made perfectly representative of all the political elements within it, and the gerrymander would become extinct.

Proportional representation would give us servants in whom the people had confidence at the time of election, but it would not preserve them from temptation after they were elected. To do that we need the referendum. We have had Legislatures, Railroad Commissions and Boards of Supervisors apparently composed of the best men in the community, and has seen them succumb to the advances of the sack as the chaste snowdrift yields to the ardent wooing of the summer sun. Such things may be expected whenever men are placed in a position in which their interests as individuals are opposed to their interests as citizens. The corrupting power of corporations, which is comparatively harmless when spread over the whole body of the people, becomes irresistible when concentrated upon a few legislators. The referendum would relieve legislative bodies of this pressure, since it would not be worth while to buy a decision that could be reversed by an appeal to the people. California has tried the referendum sufficiently to know how it works. The people have voted on constitutional amendments, bond issues, city charters and expressions of opinion, and they are satisfied that they know how to act for themselves without serious mistakes. With officials elected by a plan that would dispense with bossism, and the power of popular review of legislation as a check upon the officials, we should have as good a government as we deserved, and no community can expect anything much better than that.

A New York company is now manufacturing a white brick. It is so hard burnt as to be almost vitrified, and when broken shows a texture much like white marble. It is made of porcelain clay, and shows great crushing strength. The manufacturer's claim that it will not discolor when exposed to the atmosphere.

In view of the great scarcity of black walnut, once so plentiful in Canada, Mr. Joly has proposed to the farmers of Quebec that they should cultivate the walnut tree, as has been done in some of the Western States. The nuts after being left out all winter in heaps, covered with earth and straw, are in the spring planted two inches below the surface of the ground. The walnut tree is said to have a rapid growth. Mr. Joly's suggestion seems to be a valuable one, and we hope will receive the attention of the Forestry Department of the Government.—*Canadian Architect and Builder.*

A new idea has been carried into effect in hardwood flooring. It is simply tonguing and grooving the ends of each board. The idea itself is not new, but until recently no plan was hit upon to do the work cheaply enough. It is said, says the *Southern Architect*, that the work can be done by the new process for a cost of one dollar per thousand feet.

Where the end joints are made on a sleeper, or floor beam, and both ends nailed down well, we do not see any great advantage in the end tongue and groove. But where the joint is made between the supports it is certainly a good idea. Besides preventing the ends from rising or being depressed above or below the general surface, it will save a great deal of labor and considerable lumber in laying a floor.

INDIVIDUALITY IN ARCHITECTURE.

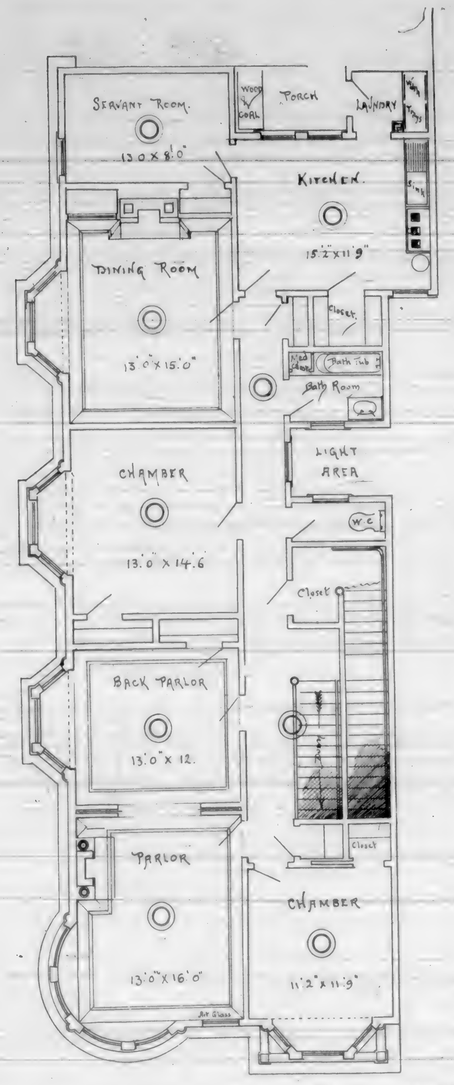
THERE is no more interesting problem than the question of the architect's individuality in his work and the part it takes in his success. A painter may be as individual as he please, may invent a wholly new style, introduce a totally fresh vogue, if he is so minded and has the ability to carry out his innovations. The same liberty is given the sculptor, and all the schools of painting and of sculpture have their origin in this circumstance. The architect has none of this freedom. He must conform to styles and conditions, to limitations and to circumstances, to men and to times as no painter or sculptor need. But there should be no complaint on this score. These are the conditions the architect will meet throughout his professional career, these the circumstances he knew would attend him the moment he chose his career.

It is quite a mistake to place the architect in the same catagory with the painter and the sculptor. Sister arts all three undoubtedly are, and in the Renaissance there were numerous artists in one branch who were also accomplished in others. This, however, implies no organic union, nor does the later differentiation of these arts imply a retrogression. All three have gained by specialism and must continue to do so. But the architect, every now and then, looks at his brother artists and sighs for their unrestricted fields, and wonders why it is he cannot follow the same unrestrained path, quite ignoring the fundamental position of his own art and the wide differences between it and the others.

The architect is thus hemmed in by conditions that may be broadly stated to be unartistic; his possibilities for producing individual work are therefore relatively small. But though not so free as the painter there is no reason why the architect should despair of impressing his personality and his individuality upon his work. He cannot create a style, it is true, and he should above all things avoid setting the fashion for a fad, but between these two extremes he can accomplish a great deal of earnest, thoughtful, individual work, which will be his own as entirely as the picture of the painter or the statute of the sculptor. Not every architect can accomplish this, perhaps, but certainly it is in some men to do so. The possibility of doing it is wholly within the architect himself. The conditions of his art, the limitations under which he works, do not in the least prevent it.

However the architect may strive to make his work individual the conditions cannot be forgotten. The design may be wholly his, but he has followed another's programme, or rather a programme made up by limitations that have no architectural meaning or signification. Hence there would seem to be no reason why an architect should sign a building in the same sense the painter will sign a painting. The architect has made the design, he has superintended the erection of the structure, he has impressed it with his personality so that the ideas are his own self, but with all this he is contending with limitations of site, of municipal restrictions, with the individual wishes or desires of the owner, which last, in many cases, frequently dominate the design as much as any part of the architect's thought. There is, therefore, a limit to the exercise of the architect's individuality. Even the great structures of the World's Columbian Exposition, which were designed under conditions practically unlimited, were designed with reference to each other, and the architect's own personal feelings and inclinations were held in check on more than one occasion. And this limiting of individuality which is found in these buildings is much more marked with the smaller structures that make up the bulk of the architect's practice.—*Architecture and Building.*

PERSPECTIVE VIEW OF FLATS, CORNER OF FRANKLIN STREET AND HICKORY AVENUE.



SECOND FLOOR PLAN OF FLATS CORER OF FRANKLIN STREET AND HICKORY AVENUE.

TENDERS TO BE RECEIVED.

Treasury Department, Office Supervising Architect, Washington, D. C., November 20th, 1893. Sealed Proposals will be received at this office until 2 o'clock P. M. on the 27th day of December, 1893, and opened immediately thereafter, for all the labor and materials required for Mail Platform Enclosure and Approaches at the U. S. Post Office, etc., building at Sacramento, California, in accordance with drawings and specifications, copies of which may be had at this office or at the office of the Superintendent at Sacramento, Cal.

Each bid must be accompanied by a certified check for a sum not less than 2 per cent of the amount of the proposal. The right is reserved to reject any and all bids or to waive any defect or informality in any bid, if it be deemed in the interest of the Government to do so. All bids received after the time stated will be returned to the bidders. Proposals must be enclosed in envelopes, sealed and marked, "Proposal for Mail Platform Enclosure and Approaches at the U. S. Post Office, etc., at Sacramento, California," and addressed to, Jeremiah O'Rourke,
Supervising Architect.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

RIGHTS OF ABUTTING OWNERS.—Where one erects a building on his own lot the fact that it shuts out light and air from the adjoining owner gives the latter no remedy, though he has enjoyed the same for more than fifty years.

Knabe v. Levelle, Superior Court of N. Y. City, 23 N. Y. Supp. 818. 36.

ACTION TO FORECLOSE MECHANICS' LIEN.—Where the statute relating to mechanic's liens requires that twenty-five per cent of the whole contract price shall be payable at least thirty-five days after the final completion of the contract, and also authorizes a claimant on establishing his lien, to recover costs and an attorney's fee, in an action by a material man to enforce his claim against the twenty-five per cent of the contract price retained by the owner, the costs and attorney's fees are chargeable against the premises, where the sum so retained was not sufficient to satisfy the claim, and the contractor suffered a default, while the owner, contested the claim.

De Camp Lumber Co. v. Tolhpy, Supreme Court of California, 34 Pac. Rep. 438. 108.

NECESSITY OF FILING CONTRACT.—The statute requiring contracts for buildings or improvements, where the price to be paid exceeds $1,000, to be in writing, and the contract, or a memorandum thereof, setting forth, among other things, a statement of the general character of the work, to be done, to be filed for record, failing in which, the contract to be void, and the owner liable for work and materials, is for the benefit of laborers and material men, as well as the owner, and failure to file the plans and specifications for a building which are an essential part of contract for its construction, is fatal. It is immaterial that the contract does not expressly refer to the plans and specifications as a part thereof, where it appears that they did in fact form a part of it, and without them it would be too infinite and uncertain to meet the requirements of the statute.

Creig v. Riordan, Supreme Court of Cal., 33 Pac. Rep. 913. 158.

RIGHTS OF SUBCONTRACTORS TO MECHANICS' LIENS.—Under the statutes requiring the contract for erecting a building to specify times when payments are to be made, and requiring twenty-five per cent of the price to be retained until thirty-five days after completion, partial payments, however they are specified as to time; may be safely made, provided no notice is given of their subcontracts by material men, in the absence of which they must rely on the responsibility of the contractor, and the twenty-five per cent, required to be retained; and in such case they are not injured by any uncertainty as to the times of payment specified, nor by payments in advance of the specified time. All that material men can require, in such case, is that at the time they serve written notice upon the owner, or, if no notice is served, at the time their lien is filed, there shall be in his hands the amount required by the contract and the statute.

Dunlop v. Kennedy, Supreme Court of Cal. 34 Pac. Rep. 93. 166.

CONTRACT OF PURCHASE SUPERIOR TO MECHANICS' LIENS.—Where building improvements are made on premises for one in possession under a parol contract of purchase only, a mechanic's lien for the improvements does not attach as against the true owner. The fact that he knew the contractor was making improvements on land owned by him, for one in possession under a parol contract of purchase, does not estop him from denying the right to a mechanics' lien, where he did not know the contractor was in ignorance of the condition of the title.

Smith v. Huckaby, Court of Civil Appeals of Texas, 23 S. W. Rep. 397. 91.

WORK TO BE DONE TO SATISFACTION OF ARCHITECT.—A certificate which is not signed by the architect, but by his assistant for him, it is not such a certificate as is called for by a building contract which requires the contractor to do and finish the work, under and to the satisfaction of the architect, and provides that payment shall be made on certificate of the architect, that the work has been done to his satisfaction; that any question arising respecting the contract shall be referred to the architect, whose decision shall be final; and that no certificate made under the contract shall be conclusive evidence of its performance.

McEntyre v. Tucker, Common Pleas of N. Y. City and County, 25 N. Y. Supp. 95. 113.

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute of Architects, meets second Friday of each month at 408 California street.
Seth Babson, Pres. Geo. W. Percy, Vice-Pres.
Oliver Everett, Sec. John M. Curtis, Treas.

Technical Society of the Pacific Coast, meets first Friday of each month at Academy of Sciences Building.
C. E. Grunsky, Pres. Charles D. Marx, Vice-Pres.
Otto Von Geldern, Sec. Geo. F. Schild, Treas.

California Electrical Society, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
Geo. P. Low, Pres. C. O. Poole, Vice-Pres.
Max Caspari, Sec. H. T. Bestor, Treas.

THE SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

THE regular monthly meeting of the San Francisco Chapter A. I. A. was held on Friday afternoon, December 8th, at the hour of 2 o'clock P. M. instead of in the evening at 8 P. M. as usual.

The innovation brought forward an unusually large attendance. The principal business of the meeting was the election of officers to serve the coming year, and after some lively balloting the following were declared elected:

Seth Babson, President; Geo. W. Percy, Vice-President; John M. Curtis, Treasurer; Oliver Everett, Secretary.

For Trustees the following member were selected:—Bryan J. Clinch, W. P. Moore, Jas. W. Reid, Geo. H. Sanders and Edmund Kollofrath.

After the adjournment many of the members remained and talked over matters of interest to the profession; and discussed means for advancing the welfare of the Chapter. Several promising suggestions were made, and will probably be tested by practical experiment some time in the near future.

PHOTOGRAPHING THE FAIR.

THE managers of the World's Columbian Exposition at Chicago, having received a large sum for the privilege of selling photographs of the buildings and grounds, were obliged in turn to protect those who had purchased that right, by prohibiting the taking of views by the general public, both professional and amateur.

This action, however, was the subject of such vigorous protests, that the managers were forced to modify their just intentions, and ultimately decided to allow the use of hand cameras with which pictures not over 4x5 inches in size could be taken; charging a fee of two dollars a day for each camera entering the grounds.

It is to be hoped that the managers of our California Midwinter Exposition will be more liberal in this matter, and allow the photographer, both great and small, professional and amateur, to have freedom from the annoying restrictions which were imposed at Chicago, and which the *Photographic Times* comments on as follows:

"It is a matter of no little regret in an artistic sense that the restrictions accompanying the grudgingly bestowed privilege of photographing at the Columbian Fair have deprived the world of many a *picture* it would gladly cherish after the glories of that Fairyland has disappeared like the fading of a dream. For albeit the work of amateur photographers (worthy of being so designated) is nearly always vastly more artistic and satisfactory than that of professionals, save in portraiture alone, as witness the samples in the British Loan Collection at the Fair, and the Annual Exhibition of the Photographic Society of Philadelphia, New York and Boston—the barring of all save hand cameras not larger than 4x5 inches, left little scope for the exercise of their taste or skill. Had the best workers among our foreign visitors or of our own land been at liberty to use such apparatus as they choosed, without restriction as to size, we should have had illustrations of this unrivaled and unapproachable wonderland now, alas, unattainable. For be it remembered that the negatives from which the larger views sold at the Fair are printed, were all made by wage workers, men whose daily business is to make a certain number of exposures for a specific compensation. Excellent though their technique may be, for "practice makes perfect," the spirit which would lead the artist amateur to spend hours if not days, in the composition and lighting of his subject must perforce be absent in them. Never before, at least in this country, have such combinations of architecture and landscape been made possible, and it is not a little exasperating to have had the wonderful beauties within one's reach, and been unable to grasp them in a larger degree than that bounded by the dimensions of a 4x5 plate. Under these circumstances it is little wonder that a majority of the most capable amateurs who visited the Fair did not do so in company with their cameras. They have not objected to the stiff charge of two dollars per day for the privilege of using one, but to the fact that the results obtained would not be satisfactory to their artistic consciences. The fashion of making negatives purposely for lantern-slides has not obtained to any great extent on this side of the Atlantic, and their small size are not generally very satisfactory for prints, while the work of the ordinary hand camera is not good enough to admit of enlargement to any considerable extent. Hence, as stated, the best workers are greatly in the minority among those who have paid for permits to photograph in the White City. A great number of "push the button" amateurs have been in daily attendance, making snap shots on any and everything in their way, especially upon the Midway Plaisance, but the results of their labors, in so far as I have observed them, have not been above the average of their now well-known performances. Most assuredly the world's desire for artistic picture remembrances of the Fair will not be greatly benefited by them.

AN ELECTRIC ROAD FOR TOKIO, JAPAN.

WHEN an electric street railway was completed for public use in Bangkok, the capital of Siam, last year, by Ohio capitalists, the Rev. J. M. Law, a medical missionary in Japan, thought that a similar enterprise would be profitable and of great public benefit in Tokio, the capital of the Japanese empire, containing 1,400,000 persons.

A few months ago he got Ohio capitalists to subscribe $100,000 to the scheme, with the assurance of additional capital after the plan was further advanced. Dr. Law then went to Japan, and, backed by the influence of American and other Ambassadors, obtained one of the most liberal charters ever granted by Empero Mutso Hita. The intention is to run a line from Tokio to Yokohama, a distance of thirty miles, and built a network of lines in both cities. J. W. Goss and Engineer Riblet have just sailed for Japan to inaugurate the scheme.—*Electrical Review.*

BUSINESS MOSAICS.

For Stairs, Rail, Posts, Balusters, etc., try the Excelsior Mill, Geo. R. Jesse, Bryant street near Fifth, who have constantly on hand a large stock and will promptly manufacture to order.

"What are you crying for, Fritz?" "Because my brothers have a holiday and I haven't!" "But why haven't you a holiday, too?" "Because I'm not old enough to go to school yet!"—*Fliegende Blaetter.*

If you do not happen to know where you will be sure to get good paper of all kinds go to A. Zellerback & Sons 419–421 Clay street, Telephone 1133—we speak from personal knowledge.

Traveler—"The Chinese make it an invariable rule to settle all their debts on New Year's day." America Host—"Y-e-s; but the Chinese don't have a Christmas the week before."—*Dollar Weekly*

The Joshua Hendy Machine Works are still at the front, as manufacturers of all kinds of machinery—making a specialty of engines and pumps for building, as well as architectural iron work, both light and heavy castings, 39 to 51 Fremont street; foundry and warehouse, Kearny, Bay and Francisco streets.

Mrs. Wimpleton—"Come, Mr. Twickenham, and let me introduce you to Mr. Shingle Nail, the coming architect." Twickenham—"Thanks, but I have already met the young man. In fact he built a house for me." Mrs. Wimpleton—"Really? And was it a success?" Wickenham—"He seems to think so. He is living in it."—*Dollar Weekly.*

Todt & Peters General House Smiths, 53 Beale street and 230 Mission street—not only manufacture wrought iron doors, fences, railing, cresting, etc., but also promptly attends to all kinds of repairing.

Darley—"My dear, what plant bears the brightest flowers?" Mrs. Darley—"I'm sure I don't know. Which is it?" Darley—"The electric-light plant."

W. H. Wickersham, building contractor, is still to be found at his old headquarters 1125 York street, he is too well and favorably known to architects to need any recommendation from us.

West Coast Wire Works 13-15 Spear street near Market under charge of Trowbridge & Son, is a place where all kinds of useful and ornamental wire work are made to order.

Stranger—"What a cheerless, dreary, depressing-looking build that is." Native—"Oh, that's only a school. Do you like fine architecture?" Stranger—"I do." Native—"Then wait till you see our new jail."—*Good News.*

Now that the Mayor has advised us all to have our houses got in good shape for the Midwinter Fair—is the time to call upon J. L. Cahill that prince of painting and decorating, 107 Sixth street near Mission, with branch store 1115 Market street.

Tommy—"Say pa, when the world comes to an end and the last card of the game of life has been played what will happen?" Father—"I suppose Gabriel will trumpet.—*Rochester Democrat.*

D. C. Condon of the Western Engineering Company, Mills Building, San Francisco, make specialties of accurate computations of stresses and strains, including bridges, buildings, etc., in iron, steel, masonry and wood. One of the large domes at the Midwinter Fair is a specimen of his work in this line.

New Girl—"What does your papa like for breakfast?" Little Mabel—"He always likes most anything he hasn't got."

Merchant's Roofing. We call attention to Merchant & Co's well known extra coated roofing, architects and contractors will be particularly interested in a new departure from the old style, this as will be seen from their advertisement in another part of this paper, is nothing less than American Continuous Roofing Plates. These plates are made in a continuous roll, are straight, 100 square feet. Each sheet is formed and joined automatically, and thoroughly soldered while in the process of coating. A stock of the above described plates are now in stock at the various agencies of Merchant & Company in New York, Brooklyn and Chicago, as well as at their headquarters in Philadelphia where full information as to price, etc., will be cheerfully given upon application.

In considering this well known brand of roofing it should be remembered it is manufactured at their works in Philadelphia under their personal supervision by the Palm Oil process only, thus it may be considered one of the softest and most reliable plates offered in the market to-day; affording protection to home industry, at the same time securing an unequalled article of roofing.

CITY BUILDING NEWS.

Buchanan and Golden Gate Ave. Two-story frame; owner, Bernhard F. Bruse; contractors, Patterson & Person; signed, Dec. 5; filed, Dec. 7; cost $2,500.

Bush and Gough. To fit complete all electric and gas combination fixtures, etc.; owners, Rict Rectory, Vestory and Wardens; architect, A. Page Brown; contractor, S. F. Novelty Works; signed, Nov. 10; filed, Nov. 14; cost $2,300.

California street No. 38. All interior finish and office fixtures; owner, C. E. Bickford; architect, Edward Kollofrath; contractors, F. W. Kreling & Sons; signed, Nov. 21; filed, Nov. 22; cost $1,812.

California near Drum. One passenger service and two sidewalk elevators; owners, Luning Co.; contractors, Cahill & Hall Elevator Co.; signed, Nov. 21; filed, Nov. 22; cost $5,071.

Castro and 26th. All work to build; owner, Frederick Raup; contractor, Henry P. Conrady; signed, Nov. 11; filed, Nov. 11; cost $3,200.

D street near 5th Ave. Alterations and rebuilding; owner, Louis Metzner; architect, Chas. M. Ronssenu; contractor, Louis Creghino; signed, Dec. 6; filed, Dec. 7; cost $4,000.

D street near 6th Ave. To build; owner, Margaret Richardson; architect, Chas. I. Haven; contractor, John W. Wissinger; signed, Dec. 13; filed, Dec. 13; no cost given.

Douglass near 17th. To build; owner, F. Rupland; contractor, Casper Zwierlein; signed, Nov. 1; filed, Nov. 20; cost $2,900.

Dolores near 21st. To build; owner, Emily McNab; contractor, C. S. Emmons; signed, Nov. 19; filed, Nov. 20; cost $3,000.

Ellis and Mason. All the steam heating and ventilating, pipes and fixtures; owners, The Y. M. C. Assn.; architect A. Page Brown; sub-contractors, W. W. Montague & Co.; signed, Nov. 1; filed, Nov. 12; cost $4,230.

Ellis and Mason. Marble work; orig-contractors, Mahoney Bros.; signed, Nov. 1; filed, Nov. 13; cost $1,138.

Ellis and Mason. Painting and varnishing; owner, The Y. M. C. Assn.; architect, A. Page Brown; contractors, Frazer & Keefe; signed, Nov. 1; filed, Nov. 13; cost $3,200.

Golden Gate Park. Exposition building for the Northern and Central Midwinter Fair Association; owners, R. M. Green and others; architect, Geo. A. Bordwell; contractor, Silas Carle; signed, Nov. 13; filed, Nox. 15; cost $8,602.

Golden Gate Park. To build Oriental Concession on streets in Cairo; architects, Leo Bonet & Co.; contractors, Hurlbut & Logan; signed, Nov. 13; filed, Nov. 15; cost $26,900.

Golden Gate Park. To build an Arena; owner, E. D. Boone; architect, Samuel Newsom; contractor, C. P. Moore; signed, Nov. 15; filed, Nov. 18; bost $5,527.

Golden Gate Park. A frame Exhibition building; owner, Cawston & Orr; architects, Percy & Hamilton; contractors, Ingerson & Gore; signed, Nov. 18; filed, Nov. 25; cost $1,340.

Golden Gate Park. Painting Mechanical Arts building; owners, Executive Com. Cal. Midwinter Fair; architect, E. R. Swain; contractors, Frazer & Keefe; signed, Nov. 25; filed, Nov. 28; cost $2,100.

Golden Gate Park. San Joaquin County building; owner, P. A. Buell Commissioner San Jose Co.; architect, Geo. Rushforth; signed, Dec. 1; filed, Dec. 1; cost $7,483.

Golden Gate Park. Los Angeles, Ventura, Riverside, San Bernardina and San Diego counties exhibition building; owner, Chas. Forman; architect, Sumner P. Hunt; contractor, Alex. L. Campbell; signed, Dec. 1; filed, Dec. 2; cost $10,291.

Golden Gate Park. One-story frame; owner, W. E. Von Johannsen; architect, J. Cather Newsom; contractor, D. T. Pierce; signed, Dec. 2; filed, Dec. 4; cost $3,900.

Golden Gate Park. San Mateo Concession; owners, San Mateo County Midwinter Fair Commissioners; architects, Martens & Coffey; contractor, John Morton; signed, Dec. 9; filed, Dec. 13; cost $2,407.

Grove bet. Lyon and Lott. A two-story dwelling; owner, Rose A. Pritchard; contractor, T. C. Cochrane; signed, Dec. 2; filed, Dec. 4; cost $2,600.

Greenwich near Baker. Two-story and basement; owner, Adolph Vitz; contractor, J. Schuler; signed, Nov. 13; filed, Nov. 13; cost $3,327.

Harrison near 25th. Two-story frame; owner, Mrs. E. G. Bond; architect, E. A. Hermann; contractor, John N. McLeod; filed, Dec. 8; cost $4,449.

Hubbard near Howard. Converting a space now used as a door way into a flat, to correspond with adjoining flat; owner, T. H. Burke; architect, W. H. Little; contractor, George Connon; signed, Dec. 2; filed, Dec. 4; cost $885.

Masonic Ave. near Page. All work to build except sidewalks and fences of a frame church; owner, Rev. James Flood; architect. T. J. Welsh; contractor, John J. O'Brien; signed, Dec. 8; filed, Dec. 9; cost $3,580.

Mission near Plymouth Ave. One-story frame; owner, J. Dunne; contractor, Wm. Plant; signed, Nov. 13; filed, Nov. 14; cost $1,313.

O'Farrell near Octavia. Excavating, grading and cutting down lot and complete bulkheads; owner, George Hess; architect, J. H. Littlefild; contractor, F. W. Schulke; signed, Nov. 21; filed, Nov. 22; cost $525.

Post and Powell. Brickwork, stonework, terra cotta and pressed brick; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, John McCarthy; signed, Oct. 26; filed, Dec. 15; cost $18,000.

Post and Powell. Wood, metal, lathing and plasting; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, D. O. Sullivan; signed, Oct. 26; filed, Dec. 12; cost $8,775.

Post and Powell. Tin roofing, metalic shingle work, etc.; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractors, Forderer Cornice Works; signed, Oct. 26; filed, Dec. 12; cost $3,982.

Post and Powell. Brick Fire place, etc.; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractors, L. E. Clawson & Co.; signed, Oct. 26; filed, Dec. 12; cost $3,229.

Post and Powell. Illuminating tiles; owners, Mrs. A. M. Parrott, architects, Pissis & Moore; contractor, P. H. Jackson & Co.; signed, Oct. 26; filed, Dec. 12; cosc $1,750.

Post and Powell. Painting and polishing; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, J. St. Denis & Co.; signed, Oct. 26; filed, Dec. 12; cost $2,880.

Post near Stockton. Carpenter work on a six-story basement and brick building; owner, V. Menesini; architect, Chas. R. Wilson; contractor, James J. O'Brien; signed, Nov. 15; filed, Nov. 18; cost $5,900.

Post and Leavenworth. Terra cotta work; owners, S. F. Verein Assn.; architects, Sailfield & Kohlberg; contractors, Gladden, McBean & Co.; signed, Nov. 6; filed, Nov. 17; cost $5,125.

Post near Leavenworth. Lathing and plastering; owners, S. F. Verein Assn.; architects, Sailfield & Kohlberg; contractors, Pacific Patent Plaster Co.; signed, Nov. 9; filed, Nov. 17; cost $4,350.

Post near Leavenworth. Gas-fitting and plumbing; owners, S. F. Verein Assn. architects, Sailfield & Kohlberg; contractors, Samuel Eckelheimer & Bros.; signed, Nov. 8; filed, Nov. 17; cost $2,600.

Post and Leavenworth. Wrought iron and cast iron work; owners, S. F. Verein Assn.; architects, Sailfield & Kohlberg; contractors, Western Iron Works; signed, Nov. 9; filed, Nov. 17; cost $1,649.

Post near Leavenworth. Carpenter and mill work, hardware and stains; owner, S. F. Verein Assn.; architects, Sailfield & Kohlberg; contractor, Thos. H. Day; signed, Nov. 7; filed, Nov. 17; cost $21,557.

Post near Leavenworth. Granite work; owner, S. F. Verein Assn.; architects, Sailfield & Kohlberg; contractor, John Sheedy; signed, Nov. 7; filed, Nov. 17; cost $2,855.

Second Ave. near Clement. To build; owner, Wm. P. Johnson; contractors Lyons & Bazer; signed, Nov. 9; filed, Nov. 14; cost $2,10

Stanyan near Page. To build; owner, J. R. Holdson; architect, W. H. Hamilton; contractor, Silas Carle; signed, Nov. 16; filed, Nov. 18; cost $4,500.

Turk and Seymour Ave. Alterations and additions; owner, Sarah Hoffer; architect, Oliver Everett; contractor, Ben Wallace; signed, Dec. 1; filed, Dec. 1; cost $3,050.

Valencia near 23d. Raising and moving a one story frame; owner, Martin Fragley; architect, M. J. Welsh; contractor, A. T. Batten; signed, Nov. 28; filed, Dec. 1; cost $2,467.

Valencia near 23d street. Addition to a frame stable; owner, Martin Fragley; architect, M. J. Welsh; contractor, A. S. Batton; signed, Dec. 8; filed, Dec. 9; cost $1,200.

ALAMEDA COUNTY.

Ashby Ave. near Raymond street, Berkeley. To build; owner, Chas. Mansfield; contractor, J. J. Rose; signed, Nov. 15; filed, Nov. 16; cost $2,157.

Alameda County Hall of Records. Wrought and cast iron work; contractors, Fortin Brick Co.; sub-contractor, H. Ralston; signed, Nov. 15; filed, Nov. 16; cost $5,450.

Clinton near 8th Ave., East Oakland. Doors, sash, blinds, etc.; owner, Mary R. Smith; architect, W. J. Mathews; contractors, Burnham & Standeford Co.; signed, Nov. 16; filed; Nov. 18; cost $1,892.

Simpson Ave. near Telegraph, Oakland. To build; owner, Mrs. C. Terney; contractor, Chas. S. Shaver; signed, Oct. 9; filed, Oct. 9; cost $1,990.

Sixteenth street and 6th Ave. Carpenter work, etc.; owner, Emil Nusbaumer; architect, W. J. Mathews; contractor, Wm. W. Winnie; signed, Oct. 12; filed, Oct. 13; cost $2,636.

Thirty-fourth near West street, Oakland. To build; owner, C. W. Hunt; contractor John S. Whalin; signed, Nov. 16; filed, Nov. 16; cost $1,800.

Webster near Central Ave., Oakland. To build; owners, Geo. W. & H. H. Dorkin; contractors, A. W. Pattiani & Co.; signed, Nyv. 16; filed, Nov. 20; cost $4,100.

ESTABLISHED 1879. - - - INCORPORATED 1889
NOW IN THE FIFTEENTH YEAR.

W. J. CUTHBERTSON, President. OLIVER EVERETT, Secretary.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

THE year just passed has not been as prosperous a one as could have been wished. But in entering upon the year 1894 we do so with brighter hopes for the revival of business and better prospects for the successful prosecution of new enterprises. The uncertainty of the passage of legislation proposed by Congress and now under consideration, has had the effect of making manufacturers, producers and importers extremely cautious and conservative in their operations. This uncertainty will be ended in a few weeks, and a long spell of quiet can safely be anticipated, when plans for the future can be made with the certainty of calculation born of a thoroughly understood condition of the market.

Manufacturers that have temporarily suspended or run on half time, in the hope of obtaining cheaper raw material, will be started up on full time, to replenish exhausted stocks, and this revival will furnish the employment so much needed at present for the unemployed.

New enterprises will be started and business generally be conducted on a firmer basis. While on this subject we cannot refrain from again calling attention to the great desirability of patronizing home industries. Why should we import building materials from abroad when they can be better produced at home. The quarries of slate, of marble, of building stone in this state cannot be surpassed; what more profitable industry could be desired than the opening up of these quarries on a more extensive scale. Why should we go east for iron and steel when they can as well be produced here. Why import hundreds and thousands of tons of cement, when the materials for its manufacture are at our door. The paints manufactured on this coast are equal to the best.

Let the capital now idle, be employed in extending these enterprises. Let the citizens co-operate by giving the preference to these home products. Let saving in freight be retained, and the money so saved used to prosecute new and as yet undeveloped fields, and riches and prosperty will be the rewards that will come.

IN our article last month, we made the assertion that in a well regulated social state there should be no valid excuse for idleness and destitution among its citizens. The fact that enforced idleness and underserved destitution exist to-day, in this and other countries, proves that the present industrial system could be improved on. As long as a bountiful nature yields ample returns for man's labor, so long will there be means for sustaining prosperous communities, which constitute the bases of all great and contented nations.

If the present state of society does not distribute justly and evenly the rewards of man's toils, if the private interests of any particular class produce results detrimental to the well being of the whole people, it should be the duty of the government to intervene.

Mr. Bierce, in a recent article, has the following to say on this subject:—

It is ridiculous to recognize an obligation to support the

helpless indigent, and deny the duty of doing what can be done to prevent helpless indigence! What nearly all the citizens of the Union are now doing hastily, wastefully and imperfectly by private effort under semi-official supervision, the State should do always.

So unfortunate and dangerous a creature as a man willing to work, yet having no work to do, should be unknown outside of the literature of satire. Doubtless there would be enormous difficulties in devising a practicable and beneficial system, and doubtless the reform, like all permanent and salutary reforms, will have to grow. That it is already in course of evolution the private and semi-official movements referred to may be taken as evidence.

As Mr. Bierce says, the difficulties in the road of improvement are many and serious, yet who doubts they will have to be met and overcome—the continued existence of our government depends on the prosperity of its people.

In considering the different methods proposed to relieve the temporary distress of the unemployed, several points must be taken into consideration—first, the action proposed should be such as not to compete with already established industries in such a manner as to injuriously affect their prosperity, else the benefit done to one party would be counterbalanced by the injury to the other—second, the employment must, at the inception of the scheme at least, be of necessity confined to such as requires mainly unskilled labor for the present purpose should be to simply secure temporary employment for the idle, till such time as they can seeure steady and remunerative employment elsewhere.

In view of the above requirements, the work provided should be of public benefit, and not for the profit of an individual.

Following out this course of reasoning, we would advocate what has already been suggested on numerous occasions by the press all over the country, viz.: Set the unemployed at work building and maintaining public highways from city to city, county to county, and state to state.

The need of better accomodations in this respect than what are now available, is very evident even to a superficial observer, and the benefit that would result from any improvements, would be enjoyed by the community at large; consequently it is only right that the community at large should bear the burden in the shape of the taxes necessary.

There is no doubt they would be paid more willingly and cheerfully than if paid for the maintenance of the jails and prisons, and courts and police departments that are now kept up in the hope of suppressing, and for the necessity of punishing crime: a considerable portion, of which, at least, can be traced directly to the degrading effects of abject poverty.

That government can best be called civilized, which by its practical results, shows the highest average standards of intelligence and prosperity among its people.

If only statesmen could be elected to govern, and if politicians could only be relegated to private life, who can doubt that a higher purpose would animate our legislatures, and correspondingly better results be achieved.

THIS journal is prepared to take charge of rendering perspective drawings in pen and ink or color. Charges will depend on size and kind of drawing wanted.

Upon receipt of plan and elevations, with a description of what is wanted, we will submit our estimates for the performance of the work.

REPORT OF THE STRENGTH OF THE DOME OF THE AGRICULTURAL AND HORTICULTURAL BUILDING, CALIFORNIA MID-WINTER FAIR.

BY D. E. CONDON, M. E., C. E., A. M. INST. C. E.
MILLS BUILDING, SAN FRANCISCO, NOVEMBER, 1893.

IN making an analysis of the strength of the Dome of the Agricultural and Horticultural Building as designed for the California Mid-Winter Fair by Mr. Samuel Newsom, architect, I have divided the problem into three parts, namely:—

I. A determination of the effects of the *dead loading*, that is to say the entire weight of the material forming the dome, regarded as symmetrically distributed.

II. A determination of the effects of the *wind force* when acting on one side only.

III. A determination of the effects produced on the various dome members by the *combined* action of the dead loading and wind force.

I. DEAD LOADING.

It is evident that the effects of the dead loading, since it is symmetrically distributed, will be uniform on the various dome members.

The dome has 24 circular *ribs* or principal lines of rafters supporting the dead load, and 24 *panels* or spherical spaces between the ribs.

The dome proper, or part between AB and GH on accompanying diagram, is divided into three spherical zones by circular *rings* or 24-sided polygons connecting the ribs at GH, CD and EF.

In the design the ribs are made secondary to the rings; that is to say the rings are made continuous and divide the ribs into three section or series of *rib rafters*.

Of course the idea is to have the ribs practically continuous also by firmly connecting the rib-rafters together and to the rings at their intersections, so that the whole structure will be bound together and act cohesively.

The intersections of the rings and ribs are the *panel points*.

Each rib consequently carries 1-24 of the entire dead load, or that of one *panel* to the base, and in doing so different compressive strains are produced in the three rib-rafters or sub-divisions of rib between the rings.

There is a compressive strain produced in the upper ring GH, zero strain in the ring EF, a tensile strain in the ring CD, and also a tensile strain at A, B. These strains are marked on diagram.

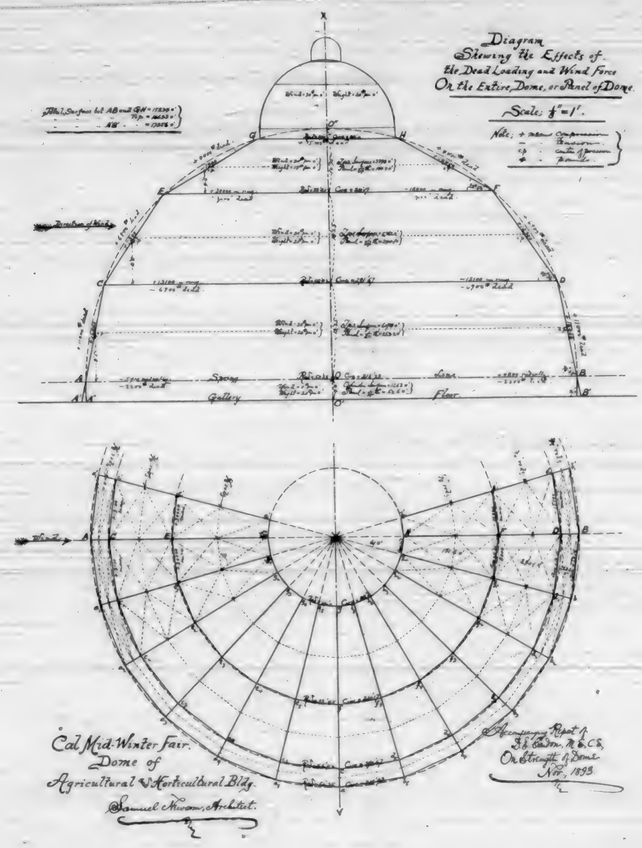
So that if the dome were to be constructed to carry its own weight only, as designed, on the assumption that the latter is symmetrically distributed as I have supposed, then all that would be necessary would be to proportion its various members and their *connections* to the strains marked on diagram. We would require simply a compressive ring or polygon GH strong enough for 15,000 lbs. or 7½ tons through 4 ft. distance between ribs or panel points; with a factor of safety 3, 4″x4″ would be sufficient for this purpose. In addition to the ring I would have a series of pieces less than 14′ long radiating from a central block to each rib, and strong enough to carry 4000 lbs, or 2 tons, for which 4½″x4½″ would be ample with the same factor of safety.

The ring EF would be free from strain.

The ring CD would be free from compressive strain; but

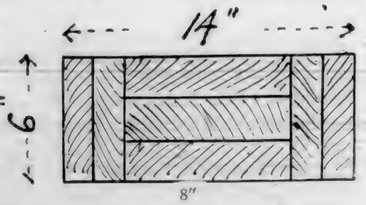
as there is a tensile strain of 6900 lbs. it should be provided for by connecting the panel points with 1⅛″ rods. At A, B we would require in a similar manner a rod polygon strong enough for 8400 lbs., or 1¼″ rods.

If the ends A, B are firmly fixed; or if the tangent AA′ of the ribs be continued to the gallery floor or base (which is



the design), then the rod polygon can be dispensed with, as the outward tendency of the rib toes at A is taken up by the struts AA′, which conveys the rib strains directly to the base.

The *maximum* compressive strain to be provided for in the ribs would be 11,000 lbs. The ribs are bent to a radius of 50 ft., with a versed sine of about 16 inches, and of the section shown in annexed sketch. So that the maximum compressive fibre strain would be about 1100 lbs. per sq. inch, which is as much as the present ribs could be expected to bear with safety.



If the various members as thus dimensioned be properly connected at the panel points, we would, so far as the *dead loading* (in accordance with our assumption) is concerned, have a perfect system of balanced strains, and perfect stability.

II. WIND FORCE ACTING ON ONE SIDE.

There are three kinds of forces brought into action on the dome by the wind force distributed over the panels of its exposed semi-surface, viz:—

I. The vertical components of the resultant wind forces, tending to hold down or preserve the stability of the dome as a whole.

II. The horizontal components of same, tending to bend over the dome from the wind to the lee side, and overturn it or destroy its stability as a whole.

III. The resultant forces, or the combined action of these components, have at the same time a tendency to distort or destroy the spherical shape of the dome by producing unequal strains in its various corresponding members.

In the first place we will consider the distorting action of the wind force.

The *maximum* effect of the wind will evidently be pro-

duced on the panels (2 opposite and rib) directly opposed to its line of action, will be less on the adjoining panels and ribs, still less on the next, and so on in proportion as the angle between the panel face and wind direction becomes less, and will be a *minimum* on the panels (2 opposite and rib) at right angles to its direction. I have regarded the wind as distributed above AB (the spring line) as shown on diagram, and the ribs as fixed at A, B, etc.

If we imagine the ribs AX, XB, with a half-panel on each side (including the two small top domes), and the rings GH, EF, CD as standing alone; and resolve the wind pressures on the sub-panels AC, CE, EG, and the two small domes GX, into their components at A, C, E, G, H, we get a series of forces which we compound into a single force at each of the panel points A, C, E, G, H. These will be the *maximum* forces at the panel points, and the corresponding strains in the rib-rafters and rings will be the *maximum* strains—which are marked on the diagram.

The strains in the rib-rafters (AG, GB) and rings due to the panel forces at a-1 c-1 e-1 g-1 will be less than the maximum strains; and as the *minimum* panel forces act at a c e g, the corresponding strains in the rib-rafters (eg and opposite) and rings will be a *minimum or zero*.

In the ring EF for instance the maximum compressive strain will act from E towards e-1, and from E towards e'-1. The compressive strain due to the panel forces at a-1 c-1 e-1 g-1 will act from e-1 towards E and from e-1 towards e-2 the former having a tendency to balance the maximum strain from E towards e-1—but being less the result is a tendency to move E and e-1 towards XY; and there will be an actual movement of these points unless the rigidity of the ring and connections with the rib-rafters are sufficient to counteract this tendency—which will be a maximum at e as the minimum or zero radial force is at that point... Consequently if the ring is rigid enough in itself, but the ribs are not capable of (or designed to) taking up the outward and forward tendency of the panel points, the circular form will become distorted into that of an oval having its major axis in the direction XY, and its minor axis in the direction XA; unless we counteract this by connecting the panel points of each ring with horizontal tie rods, and those of the different rings and the base by means of a system of diagonal tie rods. In this manner we convey (without distortion) the maximum strain from E to e and from e to F—where it will be balanced by the same strain coming from the opposite side.

So much for the wind side. On the lee side the tendency will be to produce an exactly opposite effect. The maximum tension at F will tend to draw the panel points inwardly and forward; the rigid ring and diagonal tie rods will prevent this, while the horizontal tie rods will convey the maximum tension from F to e and from e to E, where it will be balanced by the same strain coming from opposite side.

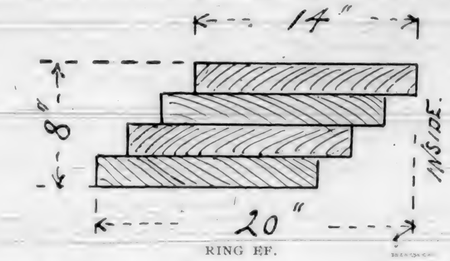
But now we have, at the same time, a resultant radial (horizontal) tendency to move the whole ring bodily forward. There is also a similar tendency to move the other rings GH and CD forward at the same time, but in less and greater degree. Hence in order to make this tendency relative between the rings it becomes still more necessary to connect them by means of a system (analagous to the web in girders) of diagonal bracing or tie rods between the panel points, as indicated on diagram. This system connecting the different rings together and to the base gives (in conjunction with the ribs) the entire structure the nature of a homogeneous shell.

III. DEAD LOADING AND WIND FORCE COMBINED.

The combined maximum strains to be provided for are marked on diagram.

The maximum rib strain is 16,000 lbs. compression. The ribs being bent to a radius of 50 feet, and consequently having a versed sine of about 16 inches, with about 22 feet between panel points, the section as designed would have to bear a maximum fibre strain of about 1600 lbs. per sq. inch, which is too great for a laminated rafter. Hence it would be necessary to introduce three additional polygons of struts and tie rods connecting the ribs *midway* between the base AB and ring CD, between the rings CD and EF, and between the rings EF and GH, as shown on diagram by broken lines.

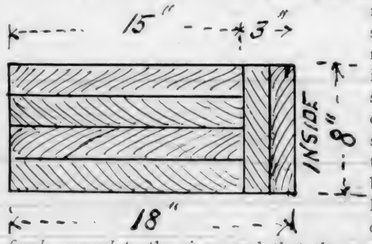
It remains to provide for the strains in the rings EF and CD. The maximum compressive strain in EF is 30,000 lbs. or 15 tons with 8.76 feet between panel points, for which the



RING EF.

ring as designed (annexed sketch) is strong enough. The maximum tensile strain in EF is 18,000 lbs., for which a 1⅜" rod would be ample. The design provides for 1¼" rods.

The maximum compressive strain in CD is 13,100 lbs. or 6½ tons, with 12.15 ft. between panel points, for which the



ring as designed (annexed sketch) is certainly strong enough on the assumption that the ribs are braced as I have indicated, and *firmly secured* to the rings, and that the panel points are connected by means of a *system of diagonal* tie rods as also proposed. I fail to see the necessity of the cumbrous truss, 6 ft. deep, designed for this ring—which will destroy the appearance of the inner surface of the dome, unless it can be utilized for some purpose (such as a display of flowers for instance) which will off-set this effect.

The maximum tensile strain in CD is 15,400 lbs., for which a polygon of 1¼" rods connecting the panal point will be sufficient. The design provides for only ⅞" or 1" rods.

My suggestions for changes are marked on diagram by broken lines.

"So you used to be in business for youself, eh?" asked the business man. "How does it happen you are looking for employment?" "I guess I wasn't up to business ways," answered the applicant. "Every time I failed I made a failure of it."—*Indianapolis Journal.*

CALIFORNIA MARBLE.

STRANGERS visiting San Francisco and other cities of California are at once struck by the absence of the use of marble in the construction of our dwellings and business blocks. This fact is brought more forcibly to their minds when after a short stay here they become convinced that there are a great many men of wealth in this state, also that they reside in beautiful and costly homes, at the same time these houses are constructed almost entirely of wood, thus the impression is forced upon the visitor that marble is not to be had here only at such a price that almost prohibits its use, that we must depend solely on our vast forests of redwood and other timber for our building material.

It is with a view that some of these same visitors may read this article and become convinced that the conditions here are just the reverse that we publish it; at the same time may it serve to call attention to the residents of our state and those intending to build, that we have confined in the hills and mountains of California vast deposits of white, variegated and colored marbles. Material that for strength, duriability and appearance will compare with any produced in the world, and above all cheaper than the imported article.

It is my intention in this review of the different marble deposits of the state, to show no favor to any particular material, but as near as in my power make a fair statement of the various kinds and qualities, where they are quarried, and such other information as I may have, when the purchaser can judge for himself after an examination of the different materials. However, I do not hesitate to say that if there is a deposit of poor marble being worked in California to-day I do not know of it. They are all good, will take the place, and in many cases, give better satisfaction than the imported article.

Inyo county marble.—Near the base of the Inyo mountains in Owens valley near the lake of the same name, lies what is perhaps the largest and most wonderful deposits of marble that has been as yet discovered. It is impossible to describe truthfully these vast deposits of beautifully colored stones.

There is white, black, blue and yellow in pure colors, purple veined, black and gold, making a grand variety of colored marbles very beautiful for interior decoration. The white marble is perfectly clear, the grain is fine, very compact and will stand great pressure; it is a pure dolomite, therefore, will take on and retain a very fine polish.

The first two stories of the Mills Building in this city are, as well as a greater part of the interior finish of same, done in this material and is a most creditable piece of work, the main entrance to the building shows what may be done in the way of relief with the white marble.

The black is almost identical in color with the Belgium black marble, it is very difficult to distinguish one from the other when polished. The yellow marble varies from a delicate cream to a dark mottled orange, there are veins of deeper yellow with fern like markings similar to moss agate is particularly adapted for furniture and interior decorations.

Inyo moss agate marble.—The color of this runs from light to dark lively browns with beautiful fern like markings and I understand is the only marble of the kind known; it takes a fine polish.

Much more could be said of the colored marbles of Inyo county but I must retain space for some of the other counties and their marble. Yet before passing from Inyo it is but just that I mention the fact of it being my extreme good fortune a few days since to be shown a very large collection of fancy colored marbles (in sample) from Italy, and at the time I took pains to obtain from the party the pieces of the different varieties on board the vessel at Genoa, Italy, and also delivered here in San Francisco. I found the prices of these colored marbles were far in excess of the Inyo colored material, and while I must admit that there was some very beautiful specimens of marble in the collection from Italy, I say without fear of contradiction, that the colored marble of Inyo county is fully up to their standard and in my judgment much more beautiful. The question may be asked, are the Inyo deposits being worked? I answer yes, and with a plant of the most improved machinery, capable of turning out as high a grade of work as can be done any place in the world.

AMADOR COUNTY MARBLE.

Situated about six miles from Jackson the County Seat of this County, is vast deposit of True Marble and what is perhaps the truest material (of the marble family) yet discovered in the United States. There are many points about this material which are pleasureable to note.

As yet there are but two varieties developed although the vein is uncovered on the face of the hill for a length of about 275 feet and a height of over 400. This marble is variegated in color, one a gray black vein and the other a pure white with jet black veins. The markings of the variety is similar to some of the Italian marble and is far more beautiful from the fact of the black veins standing out in bold view, while in the case of the Italian marble of this grade the black veins seem to be beneath the surface and are more of a gray than black; a comparison of the two materials leads to a verdict in favor of the Amador Marble. A feature of this material which I have not seen in any marble yet discovered in the United States, is that it is very compact of great strength when put under pressure, yet very easily worked, saws much better than the Italian and for relief work is much preferable to the imported material. I have talked with several marble workers about this and in each case they informed me that the Amador Marble worked up better than the Italian. These quarries were first opened by an Italian of years experience in the quarries at Carrara, Italy, recognizing the excellent features of the material, he came to San Francisco and organized a company composed mostly of his own countrymen who were fully alive to the fact that in the Amador marble they had a material that compared with what they had seen in their own country. The company was named "The Carrara Marble Co. of Amador," after the City of Carrara, Italy, about $50,000 has been spent in the opening of the quarries by these parties. The most prominent piece of work done in this material was the interior work and grand stairway of the Stanford University Museum and is really a magnificent piece of marble work. I am reliably informed that samples of this material have been shown to Mr. Vechhi one of the largest quarry owners in Italy he pronounced it equal to the best (outside of the statuary) Italian material, and predicted that it would eventually drive the imported article out of the markets of the Pacific Coast. This marble received the hightest recommendation from the United States Supervising Architect of all the different varieties of stones presented to the government (in samples) for use in the construction of the proposed new Post Office in San Francisco.

SAN BERNARDINO COUNTY MARBLE.

Here again we have an immense deposit of marble very different in character from that of Inyo or Amador counties, at the same time it is a very fine material of different varieties, there is black, dark gray and blue, these are variegated; also pure white. The deposit is situated about one mile from the town of Colton, has excellent railroad facilities and an improved plant of machinery for working the marble into slabs, pillars, wainscoating and tileing. A company was organized some four years ago to work this deposit. Their principal marble job was done in the interior of the new Academy of Sciences building in this city.

I am informed that the property or the business of the company has now passed into the hands of two experienced marble men from the eastern states, and I understand that these men are fully able to handle the quarries as well as the mill. I trust their efforts will be successful, for the marble from these quarries is worthy of the consideration of every one intending to build or desiring to use marble in any form.

San Diego county also contains a deposit of green marble, a beautiful stone very much the nature of onyx. Sometime since, the parties owning these quarries started in to open them. I have no knowledge of what is being done there at present. I have seen the marble in the rough and finished, it takes on a beautiful polish and is worthy of a place among the best marbles on the market.

In many of the other counties of this state deposits of fine marble have been discovered, none of them have been opened to any extent and are only awaiting capital to develop them.

After calling attention to the above array of material lying at our doors, the thought comes to me why it is that the people of this state do not use more of this material for building purposes and why if they want marble steps, wainscoting, mantles, washstands, etc., that that do not call for the California article? Surely it is far better for themselves and the state in general that they buy home material; not alone can it be bought for less but generally speaking is much more preferable.

Aside from this, by patronizing the home quarries one is fostering an industry that will at no late day make it self felt in the affairs of our state. I am in a position to say that there is plenty of capital awaiting the demand for California marble to show itself, when this same capital will be embarked in the business, both in the development of the present and new quarries, as well as in the erection of mills for working the material. A fair demand in a few years will find the quarries of California as large a source of revenue to this state as the quarries of Italy are to that country, and as the marble quarries of Vermont and Tennessee are to those two states.

Quarrymen and marble workers as a rule are very thrifty men and make intelligent citizens; they are paid good wages when employed. We have very few of them here from the fact that there is no call for their skill. When we want marble let us demand the California article and take no other (it is cheaper and better) we will find it will be but a short time when these same quarrymen and marble workers will come to make their homes with us and find employment in beautifying our homes and business blocks.

Nothing can take the place of a pair of marble steps, they are always bright, clean looking and require no painting; never out of place be it leading to cottage or mansion, and while the first cost may be a slight advance on wood or cement, in the long run they are far cheaper.

In conclusion let me say that I trust the architects will use their efforts in behalf of California marble.

ANNUAL BUILDING SUMMARY.

In the following table we present the number and value of buildings erected in San Francisco during the past year, as shown by the contracts filed at the City Hall.

FOR FIRST SIX MONTHS.—1893.

1893	No. of Buildings	No. of Contract	Brick Building Value.	No. of Buildings	No. of Contracts	Frame Building Value.	No. of Buildings	No. of Contracts	Alterations & Additions Value.	No. of Buildings	No. of Contracts	Total Value.
Jan'ry ...	3	7	$ 70,770	27	35	$ 143,988	21	5	$ 6,040	32	47	$ 220,798
Feb'ry ..	1	3	22,400	40	47	204,447	18	25	61,052	59	67	288,899
March ...	5	9	290,458	48	55	277,323	18	39	280,221	65	93	848,002
April	7	17	124,783	57	67	254,827	12	18	41,667	76	83	420,287
May	1	2	15,950	65	77	280,129	10	11	20,409	81	90	316,488
June.....	7	11	78,347	60	73	332,827	8	11	18,850	75	95	430,024
Total	24	49	$ 614,518	297	354	$1,498,541	68	109	$425,239	298	475	$2,524,498

FOR SECOND SIX MONTHS.—1893.

1893	No. of Buildings	No. of Contracts	Brick Building Value.	No. of Buildings	No. of Contracts	Frame Building Value.	No. of Buildings	No. of Contracts	Alterations & Additions Value.	No. of Buildings	No. of Contracts	Total Value
July	4	10	$ 60,384	47	67	$ 303,252	22	37	$ 40,482	73	114	$ 404,118
Aug	1	5	36,500	22	33	79,423	7	10	13,777	30	48	129,700
Sept.....	5	11	53,212	35	41	193,629	6	7	20,710	46	59	267,542
Oct.....	2	17	102,855	32	51	130,785	36	46	39,603	70	114	273,243
Nov	2	6	59,145	20	36	139,542	5	9	4,728	27	44	203,415
Dec.....	1	7	27,800	22	39	118,849	4	7	13,397	27	51	160,016
Total	15	56	$ 339,896	178	267	$ 965,480	80	116	$132,697	273	430	$ 1,438,034
G'd Total	39	105	$ 954,414	475	621	$ 2,464,021	148	225	$ 557,936	571	905	$ 3,962,532

In addition to the above recorded contracts, there should be included an estimate of about $500,000 for work done and not recorded, making a grand total for the year 1893 of $4,462,532.

We give the total values and numbers from 1880 so that our readers may make a comparison:

1880—	397	engagements,	value.....	$ 1,754,435
1881—	533	"	"	3,790,732
1882—	785	"	"	3,896,212
1883—	803	"	"	5,261,689

1888—	891	"	"	6,244,220
1889—	1,081	"	"	7,500,000
1890—	1,037	"	"	7,095,013
1891—	1,162	"	"	6,946,056
1892—	920	"	"	5,856,341
1893—	905	"	"	3,962,532

LIPPINCOTT'S MAGAZINE for January, 1894. The complete novel in the January number is "The Colonel," by Harry Willard French. Based on a romantic adventure, in which the hero saves the heroine's life at sea, the tale goes on to study the characters of these two highly-gifted idealists, and to trace the fortunes of a mutual passion which neither is willing to own. The sentiment throughout is the purest and loftiest of which human nature is capable, and the chapters appeal to the reader's heart no less than to his brain.

CALIFORNIA ARCHITECT AND BUILDING NEWS.
SAN FRANCISCO.

VOL. XV. No. 1. JANUARY 1894

We have received the initial number of a new monthly periodical called, THE ARCHITECT AND BUILDER, published by H. T. Bestor at 408 California street.

The publication presents a very neat appearance and is to be devoted to Architecture, Building, General Improvements and the Fire Department. The subscription price is $2.50 a year.

Besides the opening chapters of a paper on the History of Architecture, there is a very interesting article on the recent pilgrimage of the Veteran Volunteer Firemen of California to the east, where they were royally entertained, and returned from their visit with memories of a most enjoyable vacation.

We wish the new publication long life and prosperity.

PHOTOGRAPHIC TIMES has a Christmas number that is a pleasure to look at, among other good illustrations snap shots in the south cannot fail to please both old and young. In giving Mrs. E. Main a place among the distinguished photographers of to-day the illustration "Along the Mountain Road" and other views in Switzerland will convince the reader that Mrs. Main has not been misplaced.

Astromical Photography at the Lick Observatory by Prof. E. S. Holden will interest astronomers.

ECONOMY IN SLATE ROOFS.

THE San Francisco Slate Company is striving to convince the public of the practical economy of building in a permanent and substantial manner. While the first cost of a cheap roof is say one-half the cost of a good one, yet if the latter last four times as long as the former, who can deny the economy of the latter method. A tin roof requires constant care and attention and if left too long without paint will rust and ruin in a short time; a shingle roof exposed to the summer sun will warp and split, and the heat drying the pores of the wood renders it very inflamable.

A burning brand on a shingle roof is a great danger, let the same fall on a slate roof and no harm results. But a slate roof, from its very nature, is permanent, and as it is economy in the long run to procure the best article to be had; so when you are considering that most important of all elevated subjects, decide in the favor of a slate roof and you may safely consider yourself above criticism.

THE PARK COMMISSIONERS.

WE had occasion in a late number of this journal to speak of the Park Commissioners as gentlemen who had the faculty of making a little money go a great way in the way of improvements at the park. Now they have proved themselves to have the same faculty in the way of giving the children a day of enjoyment and the use of the park and play grounds, by inducing the railroad company to send and return the children free, enabling thousands of children to enjoy a day of recreation that will long be remembered by many. Thus the surplus derived from the playground was centainly made to go a great way, and do a great deal of good.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

CONSTRUCTION OF CONTRACT AS TO PARTY WALLS.—Where one erected a wall partly on his lot and partly on an adjoining lot, under an agreement with the then owner, by which the wall was to be mutually used and enjoyed by the respective parties hereto, and their respective heirs, successors, and assigns, for all the purposes of a party wall. One half of the cost of the wall was to be paid by the adjoining owner when it should use the wall. The contract further provided that if the adjoining owner should at any time elect, that it would not use the wall, then it should convey for a certain sum, so much of its lot as the wall occupied. The wall was a party wall under the agreement, and its character could not be altered by a failure to make the election.

Cutting v. Stokes, Supreme Court of N. Y. 25 N. Y. Supp. 365. 128.

DELAY IN PERFORMANCE OF BUILDING CONTRACT.—The fact that a builder of a house does not terminate the contract with a subcontractor for the failure of the latter to complete his work within the time specified, does not prevent the builder from recovering by way of counterclaim, damages for the delay. A builder who has failed to complete, in time, work which was required to be done, on his part, before the work of a sub-contractor could be commenced, cannot complain that the sub-contractor failed to complete his work within the time specified in the contract.

Grannis vs. Hurd Lumber Co. v. Deeves, Supreme Court of N. Y., 22 N. Y. Supp. 375. 94.

FORCLOSURE OF MECHANIC'S LIENS.—When a building contract stimulates that the architect's certificate shall be conclusive evidence of the builder's right to a final judgment, and the certificate is produced, and not impeached, there is no reason to deny foreclosure of the lien.

Snaith v. Smith, City Court of N. Y. 25 N. Y. Supp. 513. 42.

ABANDONMENT OF CONTRACT.—A building contract provided for payments to the contractor every thirty days, in such sum as shall be certified by the architect, but twenty per cent shall be retained until the final completion of the contract. The contractors abandoned the work, and it was completed by the owners. The sum retained by the owner never became due the contractor, and there was nothing in which a material man's lien filed after the abandonment by the contractor could attach.

Kelly v. Bloomingdale, Court of Appeals of N. Y. 34 N. E. Rep. 919. 79.

COVENANT IN AGREEMENT FOR PARTY WALL.—The adjoining owners of a party wall and the land covered by it have each an easement in that portion owned by the owner, by virtue of the party wall contract which runs with the land, but this is entirely independent of the original cost or expense incurred in erecting it. It is competent for the parties to provide how, when, and to whom the cost of his portion should be paid by either party, and to make the convenant to pay, a mere personal convenant, with the convenantee, and severable from his ownership of the land.

Pillsbury v. Morris, Supreme Court of Minn, 56 N. W. Rep. 171. 93.

INSURABLE INTEREST IN BUILDINGS IN COURSE OF CONSTRUCTION.—The owner of land has an insurable interest in buildings in process of construction thereon by a contractor who is to furnish all materials and labor, and be paid after completion of the work.

Foley v. Farragut Fire Insurance Co. Supreme court of N. Y. 24 N. Y. Supp. 1131. 42.

CONSTRUCTION OF BUILDING CONTRACT.—A contract to repair an old building and build an addition, the old part to be turned around, stipulated a certain sum for the whole work, to be paid as follows: "Old part placed in position, $200; foundation in and frame up, $300; inclosed and roof on, chimneys up and the building completed according to agreement, and specifications, $300." The work on the new part not being in condition to entitle the contractor to the third installment, when the building was destroyed by fire, no recovery on such installment could be had for work on the old part, though that was substantially completed, the contract being an entirety. The second coat of paint not having been put on the new part two doors not having been hung, and no lock or fastenings having been put on the front door or windows, and the house not having been delivered to the owner, it was not substantially completed.

Clark v. Collier, Supreme Court of California, Pac. Rep. 677. 611

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.

SETH BABSON, Pres. — GEO W. PERCY, Vice-Pres.
OLIVER EVERETT, Sec. — JOHN M. CURTIS, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.

C. E. GRUNSKY, Pres. — CHARLES D. MARX, Vice-Pres.
OTTO VON GELDERN, Sec. — GEO. F. SCHILD, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.

GEO. P. LOW, Pres. — C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. — H. T. BESTOR, Treas.

THE regular monthly meeting of the San Francisco Chapter of the American Institute of Architects was held on the afternoon of the 12th inst. in the rooms of the Society, 408 California street.

The Executive Committee reported that it had secured the promise of four papers on as many subjects, which would be read during the course of the year and which, it was hoped, would furnish interesting topics of discussion for members present, and cause an interchange of the ideas and experiences of the professional brethren.

The first paper will be by Geo. W. Percy, on the subject of the Use of Concrete in Architecture, its Successes and its Failures, and will be read on February 9th.

Members of the Chapter will receive the usual notice. Other persons interested in the subject are requested to procure admission tickets from the president, Mr. Seth Babson, 408 California street.

THE PORTLAND CEMENTS, "JOSSON" AND "NORTH".

AMONG the most notable of the improvements of modern times ranks the discovery and production of Portland Cement. This cement is not named for any particular place where manufactured but was so christened on account of the close resemblance that the artificial stone made with it, bore to Portland stone.

The various brands now on the market are the results of a long course of experiments, resulting in improving the quality, and establishing the uniformity of recognized brands.

The best proof of these qualities may be sought in the experience of architects, engineers and builders.

When a particular brand of cement is chosen over others in open market, the reason is that the purchaser has found by experience that the brand he choses possesses quality that make it more desirable than other brands. For example when the United States Government employs 85,000 barrels of cement manufactured by a particular firm, it is good proof that the cement is one to give satisfaction.

This amount of "Josson" and "North" Cement has been used in the construction of fortifications on the Pacific Coast, principally at Lime Point and North Point in San Francisco Harbor, and at the Cascades in Oregon.

A supply of these brands is received every month, and purchasers are thus assured of fresh cement, that has lost none of its strength by months of storage in warehouses.

A TENANT went to see his landlord about a house he had rented, and about which he had some fault to find. He mentioned several drawbacks, and then said: "And furthermore, Mr. Oppenheimer, the cellar is full of water." "Mr. Oppenheimer, the landlord, eyed him with reproach, and then exclaimed: "Full, of water? Well, vat you expect? Full of champagne?"—*Harper's Bazar.*

CALIFORNIA MIDWINTER EXPOSITION

AND A DESCRIPTION OF THE WORK DONE AND MATERIAL FURNISHED TO MAKE IT A NOTABLE SUCCESS.

THE formal opening of the California International Midwinter Exposition will take place with the appearance of this number of the CALIFORNIA ARCHITECT AND BUILDING NEWS. The event is a notable one in the annals of the state, and one that will long be remembered by our own citizens and those visitors who will desert the rigorous climate of the eastern states to enjoy the equitable climate and proverbial hospitality of the Golden State. A few words of commendation can well be bestowed upon those individuals and firms who have by their individual support and assistance, rendered these results possible and we take pleasure in awarding them the credit their exertions so fully merit.

THE Midwinter Fair owes a great part of its success, if not the greatest part of this success, to the skill, courage and perseverance of the contractor who built the beautiful structures to house the exhibits.

As it was absolutely essential that the buildings should be ready on time, it was necessary that the contractors should bind themselves to forfeit hundreds of dollars a day for every day's delay in the completion of the buildings beyond the limited time allowed. Under these circumstances it required a deal of nerve to step forward and offer to assume the heavy burdens and serious responsibilites inseparably connected with the enterprise. Unknown difficulties could be counted on to arise, with the certainty that delay would be fatal. Nevertheless the builders of this city eagerly welcomed the opportunity of showing to the people of the state that they were equal to any contingency that might arise, and there was certainly no lack of bidders for the work.

Smilie Brothers were the successful contractors to whom was awarded the contract for the construction of the Manufacturers and Liberal Arts Building, the largest of the buildings, and night and day for many weeks pushed the work to final completion; for when the light of day was no longer available, electricity, the light of night, was called into service; and thus the Californians of a later day showed the pioneers that the push and energy of early days had descended unimpared to present times and in the realization of this fact there is quite as much satisfaction, as in the enjoyment of the more substantial profits coming there from.

THE SAN FRANCISCO LUMBER COMPANY.

THE buildings that form the principal architectural attraction of the Midwinter Fair, are with one exception of wooden construction, covered with staff. An immense quantity of lumber necessarily entered into their construction, and yet this one firm alone in this city furnished more than two-thirds of the amount required.

This firm was incorporated in May, 1887, and the officers and directors are as follows:—W. J. Adams, Pres.; C. S. Holmes, Vice-Pres.; W. H. Talbot, Treas.; Chas. Hanson, A. W. Jackson, A. D. Moore, R. L. Taylor, Directors; James Greig, Sec.; J. N. Curtis, General Manager.

This company and its connections outside of San Francisco, generously responded to the appeal of the promoters of the Fair, and devoted outright five hundred thousand feet of lumber for use in the buildings. The enormous stock of lumber carried by this company can be readily imagined, when we say that in their yards at the foot of Third street and at Fourth and Channel streets, are stacked twenty million feet of pine and ten million feet of redwood.

This immense stock enables them to fill orders for any size and kind of timber, without the least delay, and will explain why they are able to furnish any amount of lumber as soon as the order is received.

While the above description will give our readers an idea of the extent of the business, the accompanying illustrations will be of interest, showing as they do their yard at Fourth and Channel streets, San Francisco, their mills at Tacoma, Port Blakely, Port Gamble and Port Hadlock, Washington, four out of the nine mills controlled by the company.

The extent of the trade can be imagined when we state that there is no country in the civilized world but what purchases the products of these mills. However the principal foreign countries with which the largest proportion of the business is carried on, are Australia, Chili, Peru and The Hawaiian Islands, while the trade in this country takes in the entire Pacific Coast.

Besides the millions of feet of lumber kept in stock to meet the demands of the local market, the company keeps a complete list of dry, clear and surface redwood and Humboldt shingles for eastern shipment.

Their place of business uptown is at 303 Montgomery street, and their offices and yards are situated, one at the foot of Third street and the other at Fourth and Channel streets.

WESTERN IRON WORKS.

THE lightening rapidity with which events take place in this latter part of the 19th Century, was never better illustrated than at present, at our own doors, and by our own people. Think of an exposition, international in character, conceived, elaborated and carried to completion within the space of six months; yet that is what we have just witnessed, and we are becoming so accustomed to the marvelous that it will soon fail to excite surprise.

Think of the capacity for organization that is required; the rapid and intelligent thought, supplemented by as rapid execution. Every detail to be thought of, and men and means provided for its realization.

The general public see and applaud the results. The scientific mind realizes the strain that is necessary to foresee obstacles and provide in advance the means to be employed in overriding them.

The delay of an hour in the arrival of reinforcements in a battle means defeat—the delay of a day in the arrival of the necessary material for a building, causes quite as serious consequences in the progress of the work, and if when it comes it does not come in proper shape to fit to a nicety, everything is thrown into confusion. No such possibilities can be admitted in work of the magnitude of the buildings we now see before us, in the Midwinter Fair, and such confidence had the contractors in their resources, that they bound themselves by a forfeit of $400 per day for any delay.

Under such circumstances no chances of failure could be taken, and as in instance of good judgment in this regard, we will instance the iron work used in the combination trusses and girders of the Mechanical Arts building designed by E. R. Swain, architect, and of the Fine Arts building designed by C. C. McDougall & Son, architects.

This work had to be delivered early in the course of construction, and to have it ready on time the large establishment of Sims & Morris worked day and night. Notwithstanding the haste, however, everything was ready promptly, and $15,000 worth of work when wanted was found to fit to a hair. By such care and attention to details The Western Iron Works, Sims & Morris, have reached their present high standing, and they can safely be relied on to continue in the way that has led them to such business success. Their address is 123–125 Beale street.

ARTISTIC DECORATION AND PAINTING.

AFTER the construction of the buildings of themselves the next most important point is their decoration in a fitting manner. The points of beauty should be made more attractive by color, and from this point of view the buildings surpass those of the White City.

Fraser & Keefe, one of our oldest and best known firms, have carried out the ideas, in this respect, of the designers of some of the main exhibition buildings, and the artistic work done on the Manufacturers and Liberal Arts Building, the Mechanical Arts Building and the gilding on the Fine Arts Building, secured them various other contracts, notably the decoration of the Cairo and Oriental Concessions and the Festival Hall. Messrs. Fraser & Keefe personally supervised this branch of the work, and it will be interesting for our many readers who will admire their work during the next six months, to know whose taste and skill they are indebted to for the pleasure.

As the best method of expressing our appreciation of good work is to patronize the workman, make a mental note that the address of Messrs. Fraser & Keefe is 310 Stockton street, San Francisco

FRESCO PAINTING AND INTERIOR ART DECORATING.

NO matter how well a building is planned and constructed, all will acknowledge that unless good taste in designing and good judgment in the execution of the design of decorating and ornamenting, the full effect may be lost, and the result fall far short of what the architect intended to produce. A. Page Brown, architect of the Administration Building, may therefore congratulate himself upon having Messrs. Moretti & Trezzini, fresco painters and interior art decorators, employed for that purpose. We feel sure that upon the completion of their work upon the building, the verdict of the public will be unanimous in declaring that the interior of this stately and imposing building has gained much by having the work intrusted to such skillful hands as Moretti & Trezzini's. Among the many buildings that they have decorated may be mentioned the following:—St. Ignatius Church, St. Mary's Cathedral, of this city, Macdonough Theatre in Oakland, also most of the best residences and banks in this city. Their fame in fact extends all over the coast from Portland to Los Angeles.

EXHIBIT OF THE JOSHUA HENDY MACHINE WORKS AT THE MIDWINTER EXPOSITION.

AMONG the exhibits which are to be placed in practical operation in the Mechanical Arts Building at the California International Midwinter Exposition in Golden Gate Park, we are informed that the Joshua Hendy Machine Works of 51 Fremont street, this city, have in process of construction and erection, a five (5) stamp quartz mill com plete with all of the latest and most approved forms of Hercules rock-breakers, Challenge ore feeders, Triumph ore concentrators, silver-plated copper plates and as well all of the usual accessories constituting an entire plant for the perfect amalgamation and concentration of gold bearing quartz ores.

They will also place on exhibition their specialties of hydraulic gravel elevators, giants, water-gates, air valves, hydraulic pipes, etc., as adopted in the conduct of hydraulic mining enterprises in all of the placer mining districts of the world.

In conjunction with their exhibit of Quartz Milling Machinery there will be presented a complete line of horse-whims for the raising of ores from mines in the early stages of their development, also ore buckets, mining cars, etc.

They will further place in operation a Russill Automatic and an Ore and Sembower engine for use as power in certain of the departments of the Exposition for the sale of which they are the agents for the Pacific Coast States.

It is deemed proper to state that we are credibly informed that these works were awarded the hightest premiums by Award Committees of the Columbian International Exposition at Chicago for their display of ore-feeders, Triumph, concentrators. Hydraulic, Gravel Elevators, Giants, etc., such as are enumerated above in the proposed exhibit at the Exposition to be held in this city.

An examination of their extensive foundry plant and machinery works may be of interest to some of the persons who intend to visit the Midwinter Exposition, situated as they are conveniently near several street car lines on the corners of Bay, Kearny and Francisco streets in the vicinity of the seawall in the northern part of the city, where will be found a complete equipment for furnishing any description of machinery for any conditions of use and as well architectural iron work and light and heavy castings.

ON HOME INDUSTRIES AND INCIDENTALLY TOUCHING ON THE PRODUCTS OF THE PARAFFINE PAINT CO.

THE manufacturing industries of the Pacific Slope are few in number and small in proportiou to the consuming power of the population it contains. The reasons for this are many, but they are now gradually disappearing under the spirit of enterprise and independence which is taking possession of the west. Of late years there has been a tendency on the part of live citizens to aid and encourage such manufacturing concerns as ventured into the field, by giving preference to their products. In Colorado, the Board of Trade of Denver, adapted a label which certified that the contents of the package on which it was placed, was of home manufacture and they appealed to the citizens of that state to give such articles preference wherever and whenever possible—and report says that the people have generously responded to the advantage of all concerned. In other states of the west the same has been tried with varying success.

PAINT FACTORY AND STORAGE SHEDS OF PARAFFINE PAINT CO., AT BERKELEY, CAL.

In California no organized attempt has been made up to the present time to give home products the preference, though it has on several occassions, been suggested. At the same time, however, there is a strong feeling being developed that home manufacturers should be encouraged in every legitimate way provided, of course, that their quality is up to the standard, and their price reasonable. This is the right spirit and it is no injustice to eastern manufacturers, to ask the people of the west for support for home enterprises.

Among the manufacturers of California, the Paraffine Paint Co. of San Francisco, is of special interest to the architects and builders of the state. A few years ago building papers and patent roofings were almost unknown west of the rocky mountains. In the east, building papers were extensively used, and were deemed essential to the proper construction of frame dwellings, but here the genial climate and short rainy season did not seem to warrant such additional expense. Under adverse circumstances, then, began the Paraffine Paint Co. its work of introduction and education. Thousands of dollars were spent in advertising and drumming up trade, but the architects were conservative and the owners and builders obstructive. Finally the entering wedge was driven—and to-day not a house of any pretension is constructed without building paper. Though cheap eastern papers have at times flooded the market—yet P. & B. papers have captured and held the field by reason of their superior qualities and reasonable prices. These papers are entirely of home manufacture. In the construction of the cold storage rooms of the packing houses at Rodeo and Baden over a million and a half square feet of P. & B. paper were used for insulation. As these buildings were designed by eastern architects, familiar with building papers, the selection of P. & B. Paper by them was a high testimonial of the merits of the home product.

P. & B. Roofing, was for a long time, regarded with suspicion, but now after being subjected to severe tests for years, it is being specified and used by leading architects as a substitute for tin and asphaltum. Its cheapness, durability and fire-resisting qualities have compelled this recognition. A strong argument in favor of the encouragement of home manufactures arises in the fact that the construction of the immense buildings at the Midwinter Fair would have been almost impossible without P. & B. Roofing. The canvas, coal tar and paper roofings used on the World's Fair Buildings at Chicago were a source of continual annoyance and danger, and the Executive Committee and Architects of the Midwinter Fair were determined not to use them. Tin was too expensive and in addition there was not enough of it in San Francisco to roof the proposed buildings. Shingles and slate were in a large measure unsuited to the styles of architecture which the architects desired to use. It was then that P. & B. Roofing met its proper recognition—a Pacific Coast Roofing for a Pacific Coast Fair. The result is that nearly *five hundred thousand* square feet of P. & B. Roofing has been used to cover the main buildings, county buildings and buildings belonging to the Concessionary. These roofs are watertight, virtually fire-proof, and permanent and would not have to be replaced if the committee should decide to let the buildings remain. Such a fire as has just occurred at the World's Fair Grounds, Chicago, is not possible at Golden Gate Park, the roofs will not take fire from sparks and burning brands, should they fall on theme

P. & B. Paint is of especial interest and value wherever it is necessary to protect iron or wood work from rust or decay. It is acid and alkali proof and leaves no taste or odor when dry. On the water main of the Portland City Water Works nearly ten thousand gallons will be used. The pipes which conveyed the Hygia Mineral Water from Waukesha, Wisconsin, to World's Fair Grounds, Chicago, a distance of one hundred and thirty miles, were coated with P. & B. Paint. There are other P. & B. Products which have established reputations both here and in the east. P. & B. Insulating Company, which won a gold medal at the World's Fair, is required by the Pacific Fire Insurance Union to be used in the installation of electric wires. Many fires have been prevented by its insulating properties and many more would have never happened had the electrician known his business, or been honest. Everything used in the manufacture of P. & B. goods is of Pacific Coast production—and they are probably the only goods of which that can be truly said. In giving them the preference, a large amount of money which would otherwise go to eastern and foreign manufacturers and railroads is retained at home to the manifest benefit of all concerned.

AMERICAN WIRE GLASS MANUFACTURING COMPANY.

WIRE Glass, as its name implies, consists of a sheet of glass (which can be made by our process of any size or thickness) having imbedded in its centre a sheet of wire netting of any required size of mesh, or wire, or of any desired design. It can be made of any grade, from rough skylight up to the best polished plate. The advantages of this combination of metal and glass over the ordinary glass for most purposes are manifold.

For skylights in train sheds, this glass fills a long-felt want. It is a great deal stronger than ordinary skylight, enabling thinner glass to be used, or larger sheets, thus reducing weights in the roof. The wire netting which is now stretched under or over most skylights to protect passengers from dropping glass, can be entirely dispensed with, thus saving not only a large initial, but also the continual expense of replacing the wire netting; which is quickly eaten away by the sulphurous gases and steam from the locomotives. Our wire netting, being placed in the centre of the glass, cannot be reached by the gases or the atmosphere, and will of course last as long as the building itself. As is well known, glass when kept clean will transmit a great deal more light than when covered with soot and dirt; which will unavoidably accumulate in buildings used for this purpose. With the wire netting tacked underneath or above, it is very difficult to clean the glass, and this is therefore most always neglected. Wire glass, as is self-evident, can be readily cleaned, and when kept in this clean state many less lights would be required to have the same lighting effect.

Wire Glass resists fire as long as the same thickness of iron would. This quality makes it very usefull for partitions in buildings. A skylight which will not crack and fall out at once in case of fire, and thus cause strong upward drafts, which aid the conflagration, will retard the progress of the fire at the start, when every second of time is of the utmost value.

Wire Glass has been ordered and is now being used in the train sheds of the Penn. Railroad, at Broad street, Phila.; Mantua Avenue Station, train sheds and Kensington Station, Pennsylvania Railroad; Grand Central Station, New York City; train sheds of the Boston and Main Railroad, Boston, Mass., the latter sheds contain an area of three and one-half acres of glass and is the largest single order for skylight glass ever placed in this country: New Congressional Library, Wash., D. C.; Post Office Bldg., Scranton, Pa.; Post Office Bldg., New York City; Newark Post Office, Newark, N. J.; the U. S. Cruiser New York; observatory taken out by Lieutenant Peary to the Artic regions, and in countless other buildings not here enumerated.

In this city Wire Glass has been used in the *Mechanical Arts and the Horticultural and Agricultural Buildings of the Midwinter Fair;* in the Bath and Boiler House of the Olympic Salt Water Co.; in the new Bohemian Club, and has been specified for use in the two large Parrott Buildings, now being erected, one on the corner of Post and Powell streets, and the other on Market street. Other large contracts are now being figured on, to early to mention.

Any architect, contractor or builder desiring samples or other information can secure the same from the agent, Mr. Jas. A. Maguire, 130 Sansome street, San Francisco.

CITY BUILDING NEWS.

Ash Ave. near Octavia street. A two-story building; owner, B. Bernhard; architect, Edward J. Vogel; contractor, F. V. Steinman; signed, Dec. 11; filed, Dec. 14; cost $2,500.

Baker and Sullivan Alley. Alteration and addition; owner, Estate of Jno. Sullivan; contractors, Ingerson & Gore; signed, Jan. 15; filed, Jan. 15; cost, $3,920.

Carl and Stanyan. Alterations and repairs; owner, Thomas Lundy; architect, T. J. Welsh; contractor, James J. O'Brien; signed, Dec. 26; filed, Dec. 28; cost $2200.

East near Mission. Excavating, etc.; owner, Claus Flathmen; contractors, Healy, Tibbitts & Co.; signed, Dec. 18; filed, Dec. 19; cost $7.50 a pile.

Ellis and Mason. Incandescent electric light wiring; owners, Y. M. C. A.; architect, A. Page Brown; contractors, California Electrical Works; signed, Jan. 10; filed, Jan 11; cost $3,350.

Flint Tract. Alterations and additions; owner, B. Pchrisson; contractor, Carl Ahlgren; signed, Dec. 22; filed, Dec. 29; cost $1150.

Florida near 22d. To build; owner, Geo. W. Werner; contractor, Henry P. Conrady; signed, Dec. 15; filed, Dec. 16; cost $2800.

Fourth near Clement. A frame building; owner, Adolph Winterberg; contractors, Lyons & Boyer; signed, Nov. 24; filed, Dec. 19; cost $2,000.

Golden Gate Park. Decorating, etc.; owners, Vienna Prater Co.; architect, E. Kollofrath; contractors, Bush & Wacker; signed, Dec. 28; filed, Dec. 29; cost $2050.

Golden Gate Park. All work except painting, plumbing, electric work, concrete hall and annex for kitchen, etc.; owners, Vienna Prater Co.; architects, Edward Kollofrath; contractors, Mahoney Bros.; signed, Dec. 23; filed, Dec. 23; cost $27,800.

Golden Gate Park. A wooden wall and stable; owners, Oriental Syndicate architect, Edward R. Swain; contractor, Thomas H. Day; signed, Dec. 22; filed Dec. 26; cost $2,550.

Golden Gate Park. Mill work and rough framing for Vienna Prater; architect, E. Kollofrath; contractors, Mahoney Bros.; signed, Dec. 27; filed, Dec. 28; cost $2492.

Golden Gate Park. Plumbing for a Concert Hall, etc.; owners, Vienna Prater Co.; architect, E. Kollofrath; contractor, Ickelheimer Bros.; signed, Dec. 28; filed, Dec. 28; cost $1261.

Golden Gate Park. Electrical fountain; owner, Ex. Com. Cal. Midwinter Fair; contractor, J. M. Weir; signed, Dec. 23; filed, Dec. 28; cost $1000.

Golden Gate Park. All work to build; owners, Cosmopolitan Restaurant Co.; architect, Ira Fancher; contractor, Geo. Cannon; signed, Dec. 13; filed, Dec. 15; cost $9350.

Hayes near Webster. All work to build; owner, Peter Sullivan; architect, Henry T. Munson; contractor, David Ross; signed, Jan. 2; filed, Jan. 3; cost $4490.

Josephine and Point Lobos Ave. Concrete and asphaltum work; owners, Olympic Salt Water Co.; architect, E. Ernest Meiliss; contractor, A. E. Buckman; signed, Dec. 27; filed, Jan. 9; cost 9 cents per sq. ft., for concrete and asphaltum 4 inch thick; 11 cents per sq. ft. for concrete and asphaltum 5 inch thick; 25 cents per ft. massive concrete 1 to 8 composition; 22 cents per ft. massive and concrete 1 to 14 composition.

Kearny near Filbert. To build; owners, John or Giovanni Ghiggeri and Martini Segarini; architect, Chas. R. Wilson; contractor, E. Dalgero; signed, Jan. 11; filed, Jan. 12; cost $6250.

Larkin street. Alterations and additions; owner, Fred and Kate Lumblade; contractor, J. G. Chase; signed, Jan. 2; filed, Jan. 3; cost $1065.

Laurel near California. Two-story and basement; owners, Jacob and Peter Schaefer; contractor, W. W. Rednall; signed, Dec. 18; filed, Dec. 18; cost $1650.

Market near Fourth. Excavating and bulkheading; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, A. E. Buckman; signed, Jan. 9; filed, Jan. 9; cost $10,500.

Market bet. 2d and New Montgomery. Finished wood work except hard floors, alterations and additions Hoffman Cafe; owner, W. J. Sullivan; architects, Wood, Lovell & Claflin; contractor, R. Herring; signed, Dec. 30; filed, Jan. 11; cost $3000.

Market bet. 2d and New Montgomery. Marble work, etc., Hoffman Cafe; owner, W. J. Sullivan; architects, Wood, Lovell & Claflin; contractors, Ruffino & Bianchi; signed, Jan. 5; filed, Jan. 11; cost $1075.

Page street near Masonic Ave. To build; owner, S. N. Woods; architect, Edward Burns; contractors, Jas. & M. E. Rountree; signed, Jan. 6; filed, Jan. 10; cost $8725.

Rail Road near Farragut Ave. To build; owner, Ada M. Plath; contractors, Bates & Deuel; signed, Jan. 5; filed, Jan. 9; cost $1500.

Shotwell street. To build; owner, Henry C. Herbst; contractor, J. H. Pauls; signed, Dec. 11; filed, Dec. 14; cost $2980.

Sutter and Mason. Plumbing, gas-fitting, sewering and marble work to Bohemian Club; owner, S. Wenban; architects, Pissis & Moore; contractors, Sam. Ickelheimer & Bros.; signed, Jan. 4; filed, Jan. 5; cost $15,000.

Twenty-Sixth and Folsom. Alteration and additions; owner, Henry Mohr; architect, Julius E. Krafft; contractors, Ackerson & Peterson; signed, Dec. 18; filed, Dec. 20; cost $2240.

Twentieth near Noe. To build; owner, Frank Hayes; contractor, R. B. Hicks; signed, Jan. 8; filed, Jan. 11; cost $2025.

Turk near Lott. To build; owner, Wm. Boyle; architects, Shea & Shea; contractor, James Cochran; signed, Dec. 16; filed, Dec. 19; cost $1976.

Water Lot 645, 45, 10, Mission. Brickwork; owner, C. Flathman; architect, A. B. Tarr; contractor, J. Wagner; signed, Jan. 8; filed, Jan. 9; cost $2442.

Western Addition, block 326. To grade; owner, H. H. Buhne; contractor, Edward Owens; signed, Jan. 8; filed, Jan. 9; cost $250.

HAT decision the Capitol Commissioners of the State of Washington will reach in regard to the designs recently submitted in competition for their capitol building is a matter of great doubt. Prof. Ware who was called in as an expert reached his conclusions without any hesitancy. He recommended six designs out of the one hundred and eighty seven submitted from which he hoped the commissioners would make their final choice. From reports in the Washington papers it seem that the local architects and builders are inciting opposition to Mr. Ware's report.

It seems that the commissioners regard his decision as too hasty. It should be remembered that Mr. Ware was employed as an expert, and that very fact should be regarded as sufficient reason for his reaching a conclusion without delay.

Mr. Ware, as every architect knows, has acted as judge in every important competition held in this country in recent years. Having acted in this capacity oftener than any other member of his profession. He stands by common consent at the head of the architectural profession in America and the splendid success of the Chicago Exposition buildings proves that the United States leads the world.

If Prof. Ware in his keen judgment decided without hesitation that six certain designs were more meritorious than all the others submitted it can be safely assumed that he had sound reasons for his decision. Yet the Capitol Commissions only included two of the plans selected by Mr. Ware among the five from which they intended to select the final one.

By "turning down" their expert's report they will not profit fully by his advice, which will of course be a matter for the profession to regret. It seems that the governor who is chairman of the Capitol Commission desires to run things his own way, for according to report, he summarily removed one of the commissioners from office who had had the temerity to decide against the executive. The vacancy thus caused will delay the decision of the commission and it is to be hoped that they will reconsider Mr. Ware's report and give his recommendations the full weight that they deserve.

It is charged that Mr. Ware overestimated the cost of a capitol building when he determined that fifty cents per cubic foot would be required to construct the one at Olympia. The local builders stated that thirty cents per foot would be sufficient.

This has been made an important issue between Mr. Ware and his opponents. From an artistic point of view it is immaterial. But from the practical side it can be easily shown that while thirty cents per cubic foot should be ample to construct any building, most state capitols and other public buildings have cost from fifty cents to one dollar per cubic foot. Indeed some noted examples exist that cost considerable above the last figure.

For the sake of architecture and as a matter of State pride the Washington Commissioners should at least recall Prof. Ware and give his conclusions a fair hearing.

CONCRETE CONSTRUCTION.

THE FOLLOWING PAPER WAS READ AT THE EVENING SESSION OF THE SAN FRANCISCO CHAPTER OF THE AMERICA INSTITUTE OF ARCHITECTS, FRIDAY, FEBRUARY 9TH, BY MR. GEO. W. PERCY.

ON January 6th, 1888, the author read a paper before the Technical Society of the Pacific Coast on the general subject of "Practical Application of Concrete and Iron to Resist Transverse Strains," in which paper many of the early tests and experiments were recorded in detail, together with several examples of executed work. The interest by the writer in perfecting some economical method of fire-proof and permanent construction, has not diminished, and he is glad to report a fair measure of progress and success in the particular direction outlined in the paper referred to.

One of the most important problems that should find a solution in our day is of finding some method of erecting ordinary buildings with enduring materials and largely with cheap or unskilled labor, thus bringing the cost of buildings that shall resist the ravages of fire and other elements, within the means of the average house owner.

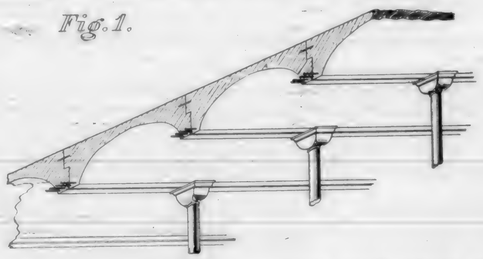
Owing to the abundance and general distribution of suitable materials for concrete, and the ease with which it may be prepared and put in place, the writer believes the desired solution may be found in that direction. The advantages of concrete for foundations and all masonry work under water or underground, are recognized by every one; also its adaptability for basement floors, side-walks and other positions where surface wear and compression are the principal forces to be resisted. For walls and partitions, floors and roofs of buildings, its adaptability has not been so apparent, or its application as successful as might be desired. On account of the small and very uncertain tensile strength of ordinary concrete, it has appeared to be entirely unadapted for horizontal beams or floors, or any parts of a structure subject to other than compressive force, nor did it appear a hopeful field for investigation and experiment. However, many efforts have been made during the past twenty years to unite the tensile strength of iron with the compressive strength of concrete in such a manner as to secure the full value of each material for its respective position. These experiments demonstrated many years ago the feasibility of the union, but the methods were more or less complicated, and wasteful of the more expensive material, iron, for which reason little use was made by the discovery until Mr. Ernest L. Ransome, of our city, invented and applied plain, square, cold, twisted iron bars for this work, and demonstrated clearly that this simple process was perfect in its results, even showing a much greater advantage than the original tensile strength of the iron.

Hundreds of tests have been made by experts in various parts of this country, and in England and Scotland, with the uniform result that cold twisting of plain iron bars increases their tensile strength from ten to twenty-five per cent, and even as high as fifty per cent. increase was obtained in one case by Lieut. Gilmore, at the Union Iron Works in this city. This, together with the fact that the process of twisting will clearly reveal any hidden defects or weak places in the bars, makes the process a valuable one, while the simplicity and effectiveness of the combination of such bars with concrete, makes a long stride towards the solution of our problem, and greatly broadens the field of concrete construction. Mr. Ransome proposes a further saving in iron by rolling the iron bars with largest section in middle of bar, and diminishing toward each end, thus proportioning the area of iron to the required strength. A similar saving can be obtained with the ordinary bars by placing shorter bars in the center of beams, in addition to those extending the entire length.

The present paper will contain notes of the principal work that has been executed in this vicinity and that has come under the writer's observation since the date of the paper referred to.

The first example in point of time is the Bourn & Wise wine cellar at St. Helena, erected in 1888. This building is 400 feet long, seventy-five feet wide and three stories high. The entire site is cut into the side of a gentle sloping hill and so arranged as to have driveways fifteen feet wide along the entire length at the rear, and at the levels of both first and second floors, while beyond the driveways and retaining walls are thirteen tunnels, sixteen feet wide, penetrating the hill about 200 feet. On the site of the building and immediately surrounding it, were an abundance of boulders, of very hard basaltic stone, quite unsuitable for rubble stone work, owing to their rounding form, but excellent material for concrete when crushed; the finer materials were obtained in the form of gravel from a neighboring creek. A good quarry of the soft but durable volcanic tuffa so common in Napa Valley, was found within half a mile of the building, and as it could be quarried, hauled and built into the walls for seventeen cents per cubic foot, it was employed for all walls and partitions of the building. The foundations, retaining walls, lining of tunnel entrances, and main floor laid on the ground, were formed of concrete in the usual manner. The entire second floor, together with the driveway at that level, was constructed with concrete and twisted iron rods in the form of beams and elliptical arches, as shown in figure 1, and as here described. Two rows of iron columns seven feet four inches on center, were placed lengthwise of the building, dividing the width into three sections of about twenty-five feet each. The floor was constructed with concrete beams seven feet four inches on cenetrs, passing entirely across the building, with their soffits resting on the iron columns. The beams were twenty-four inches deep from soffit to surface of floor, and each had four 1¼"x1¼" twisted iron rods near the bottom, with a verticle joint

Fig. 1.



along the center of each beam, protected against leaking by a strip of lead embedded in each half of the beam. The arches between the beams were elliptical in form, and the concrete five inches thick at crown of arches.

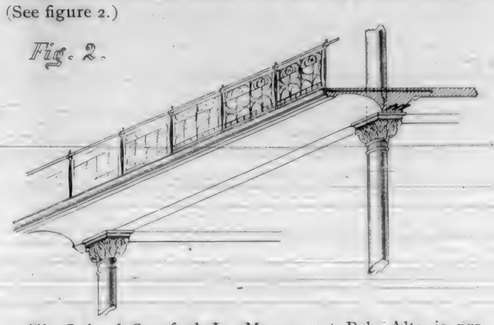
This floor was estimated and intended to carry with safety on each beam, for each twenty-five foot section, two casks each containing 2,000 gallons of wine, or a total weight, including cooperage, of 40,000 lbs., on each section 7'4"x25', or about 220 lbs. per square foot, uniformly distributed. The arrangement of the casks was intended to leave a gangway eight feet wide in the center of each section, thus giving

less stress than a uniformly distributed load. Before the building was finished, one of these sections was tested with a uniformly distributed load of 300 lbs. to a square foot, and produced a deflection of ⅛ of an inch at the centre; on removing the load the beam returned to very nearly its original position. Since the building has been occupied, many of the gang-ways have had tiers of large casks placed two in height along the entire length, and smaller casks set between the upper bilges of the large casks, thus loading the floor largely in excess of its intended capacity. Implicit faith seems to be placed in this construction by those engaged about it, that it will carry anything that can be put on it. These floors have now been in use four or five years, and answer the purpose for which they were designed by making a strong and non-absorbing floor, and assisting in keeping a uniform temperature throughout the building.

The next building of importance in which the writer employed concrete and iron floors, was the California Academy of Sciences in this city. In this case a careful estimate of cost was made of the usual steel beam and hollow tile construction, and compared with the cost of this method. The result was a saving of fifty cents per square foot, or $20,000, for the entire building in favor of the concrete and twisted iron method. After due investigation, the latter method was adopted by the Board of Directors, and executed by Mr. Ransome. This work was subject to much adverse criticism by certain architects and builders, and some members of the Academy of Sciences, and persistent efforts were made by some to have the work condemned by the fire wardens on the ground that it was not provided for in our valuable compilation known as the building ordinances. Several visits were made to inspect the work by parties connected with the Fire Department, but as they could not find anything about the construction that could be injured by fire, and having sense enough to perceive its great strength, they declined to take any action in the matter. To satisfy all skeptics in regard to the strength of this work, a test was made on a section of the second floor twenty-two feet span and fifteen feet wide; this was loaded with gravel uniformly to 415 lbs. to a square foot, and showed a deflection of only one-eight of an inch at the centre of the beam. The load was left on this floor four weeks, and during that time many of the critics were invited to examine it. That very few availed themselves of the opportunity may indicate an unwillingness to have wrong opinions corrected. To those, however, who were directly interested in the work and had entertained honest doubts of its strength, this test was satisfactory and conclusive.

The floors in this building were constructed with large beams about fifteen feet apart and flat panels eight inches thick between, with the plastering applied directly to the concrete and cornices run on the splayed sides of the beams, while the colored cement floor was laid directly on the concrete and marked off into tiles. The tension rods in these floors are hooked into wall anchors at the wall ends, and into holes cast in the flanges of iron columns at the other ends, while all around the large light well the rods clamp the iron columns together. After these floors were put in it was considered advisable to extend the floors four feet beyond the line of columns, thus narrowing the light shaft with balconies four feet wide all around. This was readily accomplished by placing the forms and filling in the concrete, with ¾"x¾" twisted iron rods near the top, placed 1' 6" apart, and extending from two to four feet into the old concrete (by cutting grooves and grouting the rods) as it is evident the tensile strain is at the top in this example. (See figure 2.)

Fig. 2.



The Leland Stanford, Jr., Museum at Palo Alto is probably the largest and most important building in the world constructed entirely of concrete. It was designed to have dressed San Jose sand stone for the external walls, backed up with brick, and to have brick partitions, with concrete floors. Owing to the great cost of stone work, it was decided to build the walls of cement concrete colored to match the sand stone used in the other university buildings, and to carry out the classic design first adopted. This lead to making the entire structure, walls, partitions, floors, roof and dome, of concrete, making it in that respect a unique building.

Having some knowledge of the disadvantages and defects natural to a monolithic building, such as result from the shrinkage and the expansion and contraction of walls, floor and roof, several new experiments were tried to overcome them, with varying results of success and failure. It was thought to overcome the cracking of walls by inserting sheets of felting through the walls following the lines of the joints as near as practicable on each side of windows. The lapping bond of the concrete, however, proved too strong to allow the cracking to follow these joints; in most cases the weakest points were found at the openings, and small cracks appear from window head to sills above.

Joints were formed through the floors about fifteen feet apart and in most cases the cracking has followed these joints and confined to them. To prevent the possibility of moisture penetrating through the walls, and also to render them less resonant, hollow spaces five inches in diameter were moulded in the walls within two inches of the inside face, and with about two inches of concrete between them. These are successful for the primary object, and partially so for the secondary.

Fig. 3.

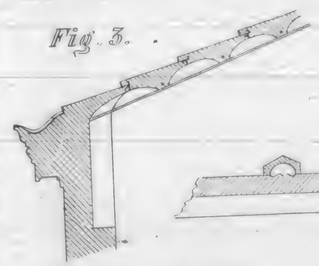


Fig. 4.

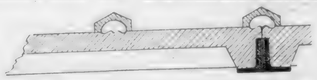


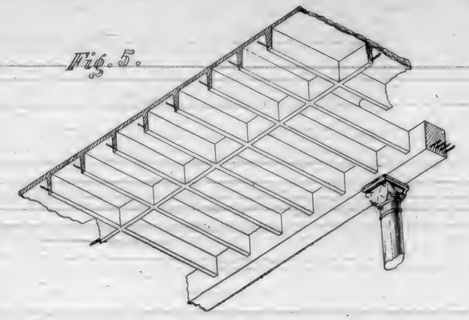
The roof being the greatest innovation, and the first attempt known to the writer of forming a finished and exposed roof entirely in concrete, required the greatest care and consideration. The result in form and appearance is shown by

figures 3 and 4, and is described as follows: The roof is supported on iron trusses ten feet on centre, and has a pitch of twenty degrees. The horizontal concrete beams rest on the iron rafters, and with the half arches form the horizontal lines of tiles about two feet six inches wide, with the joints lapping two inches and a strip of lead inserted as shown. Vertical joints are made through the concrete over each rafter with small channels on each side. These joints and channels are covered with the covering tiles shown on drawings, and similar rows of covering tiles are placed two feet six inches apart over the entire roof, thus forming a perfect representation of flat Grecian tile or marble roof. Notwithstanding the precautions taken, this roof presented several unexpected defects. The most serious proved to be in the Venetian red used for coloring matter and mixed with the cement. This material rendered the covering tiles absolutely worthless, many of them slacking like lumps of lime, and all were condemed and re-made. The same material injured the general surface of the roof, rendering it porous and necessitating painting. The roof over the central pavilion being hidden behind parapets, is made quite flat and covered with asphaltum and gravel over the concrete. This roof, with its low, flat dome, is without question the largest horizontal span in concrete to be found anywhere on earth, being 46′x56′, the flat dome having all its ribs and rings of concrete, with the panels or coffers filled with one inch thick glass, and weighing about 80,000 lbs. This structure, covering 21,000 feet and containing over 1,100,000 cubic feet of space, and requiring about 260,000 cubic feet of concrete, was completed in seven months time from the commencement of the foundations, and at a cost of about eighteen cents per cubic foot of space. This the writer believes to be a very low figure for a thoroughly substantial and fire proof building with marble stairs and wainscoting, cast iron window frames and sashes, and other parts equally enduring, and would call attention to the fact that concrete walls with iron rods imbedded, when cracked are not in the bad condition of stone or brick walls without bond, but the iron ties are always good to prevent spreading or falling, while several methods may be devised for allowing free expansion and contraction without producing unsightly cracks. Some such method should be employed on all finished structures.

One of the rooms in this building was designed to be the receptacle of many valuables, and to render it burglar-proof the floor, walls and ceiling had copper wires embedded in the concrete not over three inches apart, forming a continuous circuit, and designed to strike an alarm bell at the university if any wire should be cut. This device has been in use at the United States Sub-Treasury vaults in this city for several years, and would be very effectual for prison walls and cells, as it would be almost impossible to cut a hole through strong concrete large enough to admit a man's body, without cutting or breaking one or more of the wires, thereby giving an alarm.

Other important works have been executed in concrete in this vicinity, among which may be mentioned the Girls' Dormitory at the Stanford University, a three-story building, completed in ninety days from the time the plans were ordered.. Also the Torpedo station on Goat Island, 80′x250′, with walls about thirty inches high, built under the direction of Col. Mendill; and the addition to the Borax Works at Alameda. In the latter the walls, interior columns and all floors are of concrete, and are remarkable for the lightness of the construction and great strength. These floors are constructed as shown in figure 5. In these floors the clear span is twenty feet. The floor consists of beams four inches wide at bottom, five and one-half inches at top and one foot six inches deep from bottom of beam to top of finished floor.

Fig. 5.



The beams are placed two feet six inches on center and the floor over the beams is only three inches thick. A section of this floor 10′x20′ was tested February 28th, 1893, with the following results: Before testing there was a uniform load of 195 lbs. to a square foot, when the scale was set to indicate deflection.

With 234 lbs. per sq. ft., deflection	. .	1-16 inch.
" 273 " " " " "	. .	1-8 "
" 312 " " " " "	. .	1-8 "
" 390 " " " " "	. .	3-16 "
" 468 " " " " "	. .	3-16 "
" 551 " " " " "	. .	1-4 "

This deflection is in addition to any that may have existed with the initial load. In November, 1893, the writer visited the building with Mr. H. G. Jacobs, Government Inspector of Buildings, and in our presence a test was made on a section of the third floor, that was selected as an apparently weak spot owing to several cracks showing on the ceiling. A sliding rod was adjusted under the center of the beam. There was a distributed load of about 200 lbs. per foot at the commencement; 225 lbs. per foot additional were applied, and the deflection noted was less than 1-16 of an inch. This type of floor appears to be the best form yet devised for obtaining great strength with the minimum weight of concrete and least expense of carpenter work, the forms used being standard size to be used over again. With the present price of materials and labor, such floors can be built with twenty feet span of safe strength for 250 lbs. per square foot, and with finished cement surface, for forty-five cents per square foot, and without the finished floor surface for forty cents per foot. Level plastered ceilings may readily be suspended from the beams and wood or tile floors laid over it, as in other methods of fire-proof construction. This method of forming floors with the minimum of very rich concrete, is ligher than the common method of steel beams and hollow tiles, for the same strength. The concrete should be composed of one part of Portland cement to three parts of selected aggregates.

The results given above are much better than could have been expected or hoped for a few years ago, and it is quite possible we have not yet reached the highest development. Portland cement may be brought to a higher grade of strength, and intelligent handling may produce better results with what we have. Several tests recently made with various brands of Portland cement, to ascertain what effect on the strength of concrete would be produced by a delay between the time of mixing and tamping in place, have given surprising results which the writer believes have never been made public. These tests, as far as carried, show that the initial setting of the cement, (when mixed with sand or gravel,) is not the strongest that may be obtained, and that while a delay of one hour or less may be injurious, a delay of one to three hours may be beneficial. Thus in a test made with Knight, Bevan & Sturgess' cement, one of cement to two of sand, the result obtained was as follows:

Delay in hours: 0, 1, 2, 2½, 3½, 4½.
Test in lbs.: 252, 228, 240, 256, 306, 228.

In this case the delay up to two hours was detrimental, while a delay of 2½ to 3½ hours gave higher results. Similar tests with White's cement gave the best results with a delay of 1½ hours, after which the strength fell rapidly. The writer would suggest that this line of investigation could be profitably followed up, with many tests made with different cements and different mixtures, and the results tabulated, thus adding to our knowledge of cement and showing the way of obtaining the best possible results.

In conclusion the writer would say, that while he does not think that concrete in any form is likely to take the place of stone, brick and terra cotta for architectural work, he feels quite certain that in combination with iron it is destined to fill a large place in the construction of buildings, and for warehouses, factories, wine cellars, etc., it is now the best and cheapest material for producing substantial and incombustible work.

AIR AND WATER PURIFIER.

WE give below a description of an invention recently patented by Dr. Cornelius F. Buckley of San Francisco, which consists of a tank so made as to allow of only pure air having access to its contents.

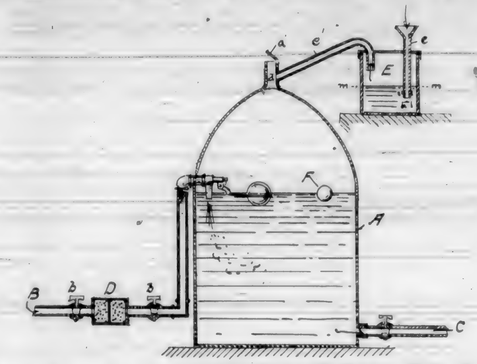
The principal of this tank is a development of experiments made by the late Prof. Tyndall some twenty-five years ago, when the question of spontaneous generation was hotly debated by scientists. Tyndall arranged a series of tubes filled with *distilled* water, exposing some to ordinary atmospheric air—and covering others with layers of cotton wool of different degrees of thickness. It was demonstrated beyond a question that the tubes openly exposed to the atmosphere teemed with living organisms in a space of twelve hours, and that similar organisms developed in the protected tubes in the inverse ratio to their protection. All recent experiments corroborate these statements and go to show that diseases of all kinds are largely obtained through the atmosphere poisoning our drinking water.

Hence, the most important, indeed the vital feature of this tank is first the complete disinfection of the air that reaches the water, second, that disinfected air in turn disinfects the water itself.

Referring to the accompanying drawing which is a vertical section of the apparatus.

A is a closed tank or reservoir of suitable construction and capacity. It is provided with the inlet pipe B, from the water main, and with the cock controlled outlet pipe C, for service. Its top is provided with the air exhaust passage *a* having at its outer end a check valve *a′*. If filtered water is to be use, there is fitted in inlet pipe B a filter D of any suitable construction and containing any desired filtering media. A cock *b* may be placed in pipe B, in advance of the filter, and another *b′* behind it, thereby the passage of water may be controlled, and the contents of the reservoir confined, when for any purpose, as for cleansing, the filter may have to be temporarily removed.

E is a closed air-disinfecting case or bottle. It has an air inlet pipe or funnel *e*, and an air outlet pipe *e′*, the latter communicating with the top of the reservoir A, or as here



shown with the air exhaust passage *a*. This air disinfector may be of any suitable construction or arrangement, and its contents may be of any proper character. It is proposed to use in it a solution of chloride of iron, the level of which will be maintained, as shown by the line *m—m*, above the lower end of inlet funnel *e* and below the lower end of outlet pipe *e′*.

Within reservoir A is a valve for automatically closing the top of the reservoir to prevent the overflow of water therefrom. In the present case this valve is shown as a float ball F, which will rise with the water and will seat itself in the inner end of exhaust passage *a*, thereby preventing the outflow of water through said passage, and also preventing it from overflowing through pipe *e′* into the air disinfector case or bottle E.

The operation of the apparatus is as follows: Water, from the main, passing through pipe B, enters the reservoir A. When the filter D is used, it enters as filtered water. As it fills said reservoir, the air is expelled through the passage *a* and check valve *a′*, and when the reservoir is full the float valve F confines the water. Now, when the water is drawn upon by the opening of service pipe C, the check valve *a′* will close and cut off all direct communication with the outer air, but air will pass down funnel *e*, through the disinfecting medium in bottle or case E, and thence as disinfected air will pass through pipe *e′*, into the reservoir A, to occupy the space left vacant by the lowering water therein. Thus, only disinfected air will be admitted and come in contact with the contents of the reservoir which will serve not only to avoid contamination but also to aerate the water and to permit its ready outflow for use.

The January number of the CALIFORNIA ARCHITECT AND BUILDING NEWS is particularly handsome. It is devoted to the Midwinter Exposition buildings, illustrated by five full-page, half-tone pictures and a sixth, of equal size, of the Santa Barbara Amphibia. The illustrations are very handsome and the detail is excellent. They have evidently been made from photographs taken on the ground. The letter-press is beautifully clear and clean and the new cover is a dainty design. Among the contributed articles is one on the strength of the dome of the Horticultural and Agricultural building by Civil Engineer D. E. Condon.—*San Francisco Chronicle.*

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

THE suggestive sketch for an entrance to the Midwinter Fair is by C. T. Taylor, Jr.

A study for a Sutter street front is by Polk & Polk, architects of this city.

RESIDENCES for J. S. Butler, Esq., is by architects, Martens & Coffee.

A Cottage for R. George Zahn, Esq., is by architect, J. Cather Newsom.

THE Columbarium now being built at Cypress Lawn Cemetery, from the plans of architect, Mr. Thomas P. Ross, is nearing completion. Although the interior finish has not been decided on as yet, it is intended to be in marble boxes or niches, with bronze open grille door, two galleries being necessary for height of building. The exterior walls consist of rock faced granite laid in broken ashlar. The dome will be covered with terra cotta tile and with skylight on deck in figured glass. The doors to be of heavy wrought iron with plate glass panels. The building is to be fire-proof in every respect.

"DUST TO DUST AND ASHES TO ASHES."

THE Crematory at Cypress Law Cemetery, built from the plans of Messrs. Pissis & Moore, which plans were published in the June issue of the CALIFORNIA ARCHITECT AND BUILDING NEWS, is now in active and successful operation.

The following article from the San Francisco *Examiner*, give an impressive idea of the ceremonies attending this disposal of the dead:

"Along the grass-bordered paths of Cypress Lawn Cemetery four silent men carry a burial casket. They bear it gently and their tread is slow and solemn. But they seek no grave where earth has been freshly turned and they lay their burden down when they enter a building of gray granite.

"The four men are strangely clad. Each wears a blouse of black silk and a skull cap of the same material. Nowhere is there a gleam of color. When they had placed their burdens on a dais, still treading softly, as silently as they came, they withdraw. For a time their work is done.

"The gray granite structure stands on the side of a gently sloping hill that at the crest is dark with the waving leaves of eucalyptus. The building is plain and massive in general effect, with considerable elaboration of detail. The style of architecture would be difficult to define, but to the interior decorations there has been given a distinctly Greek character. The structure is almost square, though broken in the upper lines, and with the roof terminating in a dome of glass. But for the tall chimney at the rear it might be taken for a mortuary chapel and nothing more. A double flight of stairs, all of granite, leads to the part that is really the chapel. This, a bright, cheerful apartment, the walls finished in light brown relieved by typical shades of the same. The floor is tiled. The lofty ceiling curves until it merges into the glass dome, through which pours a subdued flood of light. At the rear is an arched alcove, and at the head of the center aisle, which ends as it reaches the alcove, is a raised platform, an altar it might be. It is on this dais that the black-clad men lay the casket containing the body about to be incinerated, yet there is no suggestion here of heat or ashes. The members of the funeral party take seats on either side. Flowers have been piled about the casket. Then the minister speaks the words of comfort.

"When the prayers have been said and with hands outstretched above the dais the minister has pronounced the benediction, there is a change. A pall in the form of two extended wings springs from beside the platform and meeting above it, droops and hides the casket from sight. The spreading of the pall makes no sound, and when it has shut the casket from view, the dais and all upon it sinks from sight.

"In a few seconds the pall is removed as strangely as it came, the dais is again in place, but tenantless. In the bright chapel touched by the sun there is no longer sign of death. The mourners pass out. There is nothing more for them to do.

"The men in black are waiting in the furnace room below. When the casket comes down on the elevator the body is quickly removed, and, clad still in whatever raiment may have shrouded it, completely enveloped in an alum-soaked cloth. Then it is placed on an iron cradle that moves on wheels along an iron track. The furnace door is opened so deftly that one marvels how, and so without a jar that it does not seem that steel can be rubbing against steel. In an instant the cradle is pushed forward.

"For a second one may look into the depths aglow with heat, and from the back see flames leaping forward. The track is movable, for no metal could long withstand the temperature of the furnace. The track glides into the rosy interior and the cradle follows. Both are immediately withdrawn, the cradle comes back empty, the furnace door is closed once more and the dead left to turn speedily back to original elements. From the time the rigid form in white was deposited in the cradle to the time when the cradle left it in the retort eight seconds have scarcely elapsed.

"Then for once there is noise, the clamor of blows. The

VOL. XV Nº 2. FEBRUARY 1894.

costly casket is being knocked to pieces, the silver handles smashed and dented. Such is the fate of every casket that reaches the crematory. None so expensive that it is not used for kindling wood. Blow follows blow. The cloth is torn aside and the cedar underneath it shivers to splinters. The satin lining is rudely ripped away. It will be piled upon the flames. In a few moments the handsome case that loving friends had chosen is a heap of waste.

"'But does not this seem like a wanton misuse of money?' The question was asked of the Superintendent.

"'It does at first,' he replied, 'but there is no other way. Unless we did this there would be an illicit traffic in second-hand coffins. Unless we destroyed the handles they would be slyly sold. This has been done elsewhere, and we think it well to profit by the experience of others.'

"'And, then, why should it appear more wasteful than placing the same material in the ground? It is a matter of sentiment. The family feel like dedicating a certain amount to the one who has passed away. It really makes no difference whether this is placed in the fire or in the earth. One method cannot in this respect be termed more wasteful than the other.'

"But half an hour has gone by. A peep through an aperture in the furnace door, ordinarily covered by a slide, reveals nothing repellent. Lying in the chamber where the heat is 1,500 degrees the body still seems to retain its shape, because the alum-soaked winding-sheet does not disintegrate until almost the last. When it does collapse there is no longer anything within. Meanwhile ashes white as snow have been sifting through the bars into an apartment beneath. One hour and there is little left in the retort. An hour and a half, and a trace remains. Two hours; the retort glows empty. In the apartment below the shower of ashes has ceased, and the deposit is taken out without any lessening of the heat above. The retort is ready to be used again.

"The ashes are placed ni a copper receptacle as unpretentious as a milk can, sealed, labeled and put on shelf in a a room devoted to the purpose.

"There is a process of cremation unlike the one described, but it is an exception to the rule. Sometimes circumstances suggest that a body that has been perhaps in the receiving vault be not taken from the casket. In such instances the metal is stripped away and casket and occupant go into the retort together. Incineration takes longer and the residue of ashes is somewhat greater. When a casket is in the retort one may, by listening at the door, hear the crackling of fire, but ordinarily not the faintest sound comes from beyond the barrier, and the leaping flames never touch the body that their heat all but obliterates.

"The furnace-room is not designed to be attractive, but it does not appall nor repel. There is little about it to betray its use. The floor is cement, and so are the walls and vaulted ceiling. The furnace itself is of white birch lined with a clay imported from Germany, the most suitable substance known under a lasting ordeal of fire. The room is entered through heavy oaken doors.

"There is in the building one room devoid of carpet and furniture, devoid of anything but plain shelves sustaining row upon row of the copper receptacles that possess more interest than all. Some of the receptacles are empty, quite a number are filled. The later are sealed and each marked with a date and a name. All the filled receptacles are light, but some twice as heavy as others. The heaviest probably weigh five pounds, and judged by the eye, contain three quarts of ashes. The ashes, of course, are at the disposal of friends. Some are to be interred. Some in deference to requests made by the dying will be scattered to wind and wave. As a rule they will remain where they are until they can be placed in the more pretentious Columbarium for which plans have been prepared and that will one day be as notable an addition to Cypress Lawn as the crematory itself has been. Thus far the regulation copper receptacles have been used, but there is always the privilege of adopting a funeral urn more elaborate.

"It is not without awe that one looks upon the ashes of what has been a human form. The black-coated attendants handle them with all respect. One of the men goes down below the retort by a ladder and draws the ashes out. They are placed, still warm, in the receptacle. The largest particle is not larger than a silver twenty-five cent piece, and there are few this size. For the most part the mass is as impalpable as flour. The work of years been done in a few moments with no longer period intervening.

"All that has happened since the mysterious pall spread itself above the dais has been noted only by those having official right. Idle spectators are not allowed. Generally the mourners prefer not to linger after the solemn farewells in the chapels. The maintenance of privacy extends even to the names of those who have passed into the retort, these being usually held sacred and not regarded as matter of general interest. It will, however, at least remotely concern the public to know that one of the early subjects was Mrs. Griffes, for whose murder a man has just been on trial. Her ashes fill one of the largest receptacles.

"The process of cremation is so new in San Francisco that for a long time the picturesque building of gray will be an object of interest. Many visit it daily, at least to look up at the tall chimney and wonder that they see no smoke. Coke is the only fuel, and the vapor created by the destruction of fleshly tissues is utterly consumed. The crematory began operations without ostentation, and this policy has marked its conduct to the present. The managers were conscious that there was something of prejudice against the system, and feared lest this be strengthened by any chance mishap. There has been nothing of this sort.

"When the fire was started thirty bodies were in the receiving vaults, and these have been incinerated. Besides, there have been a number coming directly from the place of death, and still more are expected from a distance, one from far Mexico.

"The great surprise to the visitor is the absence of details such as might jar on the nerves. The attendants, trained and uniformed for their work, allow nothing to go amiss. When the casket sinks from the sunlit chapel it has been seen for the last time by those who watch it with tearful eyes. Their own word for it: it does not seem to them so terrible as if they saw it sinking into the grave and listened for the falling of the clods.

THE PRESERVATION OF THE WORLD'S FAIR BUILDINGS.

IT is gratifying to see with what unanimity the public is now clamoring for the preservation of the World's Fair buildings, which have certainly made an artistic impression on the country such as has never been felt before. Until within a few days, no proposition which seemed practicable has been made for keeping them, but a company has been formed which proposes to take in hand the buildings around the Court of Honor, replace the perishable staff with Portland cement on iron lath, keeping all the forms of the original, and paint the new material white. This will insure the preservation of the superstructure for many years, and it is proposed to strengthen the foundations, so as to prevent settlement and distortion. The company offers to do all this work, and to keep the buildings, grounds and waterways in order, for twenty years, in return for a concession for that period, entitling it to fence in the group of buildings, and charge a small admission fee. Independent of the question whether the company would find the enterprise profitable, there is no doubt that the city of Chicago would be benefited by the perpetuation of an attraction which may claim to have brought millions of strangers already to the city, and every artist would rejoice to see a little longer life accorded to the most renowned work that American architecture has yet produced.—*American Architect.*

The January number of the CALIFORNIA ARCHITECT AND BUILDING NEWS (monthly) is likened unto the last Sunday issue of the *Examiner*—a production which does credit to the energy and goaheadativeness of its management. The illustrations therein of the Midwinler Fair are finely executed, and original.—*Warner's Building Review.*

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute of Architects, meets second Friday of each month at 408 California street.
Seth Babson, Pres. Geo. W. Percy, Vice-Pres.
Oliver Everett, Sec. John M. Curtis, Treas.

Technical Society of the Pacific Coast, meets first Friday of each month at Academy of Sciences Building.
C. E. Grunsky, Pres. Charles D. Marx, Vice-Pres.
Otto Von Geldern, Sec. Geo. F. Schild, Treas.

California Electrical Society, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
Geo. P. Low, Pres. C. O. Poole, Vice-Pres.
Max Caspari, Sec. H. T. Bestor, Treas.

SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

THE regular monthly meeting of the Chapter of the American Institute of Architects was held on February 9th, 1894.

An application for membership was received from Mr. Edgar Marx Lazarus of 664-665 Worcester Block, Portland, Oregon, of the firm of Elliott & Lazarus. The application was presented by Mr. Reid and endorsed by Mr. Percy, and was referred to the Executive Committee to take the usual course.

The following communication was received from Mr. Percy:

Gentlemen:—Having experienced a great deal of trouble with Electrical Contractors, and being satisfied that some method should be adopted, whereby work of this kind could be properly installed, without the trouble and inconvenience usually had, I would respectfully suggest, that this Chapter consider the appointing of a permanent Electrical Inspector, his remuneration to be a certain per cent of the cost of the electric work in each installation, said amount to be paid by the Electrical Contractor, and to be added by him to his contract price.

In support of the above suggestion, I would state that such an appointment will at once relieve architects of the responsibility of designing electric installations, of drafting plans and specifications therefore, and of the supervision thereof. It will positively prevent imposition from the placing of inferior or unreliable electric work and in effecting the solution of the electric wiring problem, will be of the greatest service to both property owners and architects.

I would also suggest that in all Electric Specifications furnished by the architect, the contract should cease at the wiring of the gas outlets, and not include the electric burners, for the reason, that very often, owners do not place fixtures in the building for months after same is finished, thereby keeping the contractor out of his money through no fault of his own.

I also think that where possible, the electric work should be a separate contract, but all carpenter work in connection with same, such as closets, doors, wainscoting, etc., should be included in the carpenter's contract.

I respectfully ask the Chapter to discuss these matters and appoint a committee to consult with the different Electrical Contractors to see what can be done toward carrying out these ideas. G. W. Percy.

Mr. Percy was appointed a committee to confer with the Underwriters and the Electric Light Co., and endeavor to carry out some such arrangement as suggested.

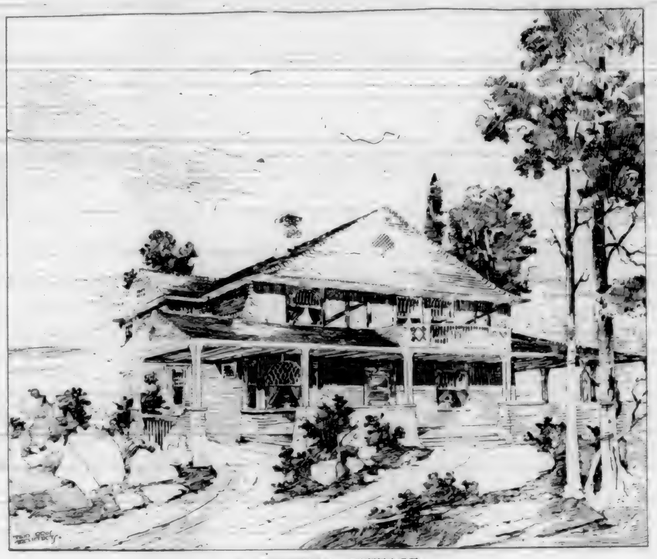
A communication was received from a committee of the Institute, requesting the views of the Chapter on the relationship of the Chapters to the Institute and to suggest such changes as may be deemed expedient.

A committee consisting of Messrs. Polk, Reid and Pissis, was appointed to act with the President and Secretary.

A letter was read from A. J. Bloor, the Secretary of the New York Chapter, in relation to the history of all the transactions of the American Institute of Architects, and kindred organizations, and the Secretary was instructed to assure Mr. Bloor of the hearty co-operation of the Chapter, and too offer such assistance to him as it may be in the power of the Chapter to give.

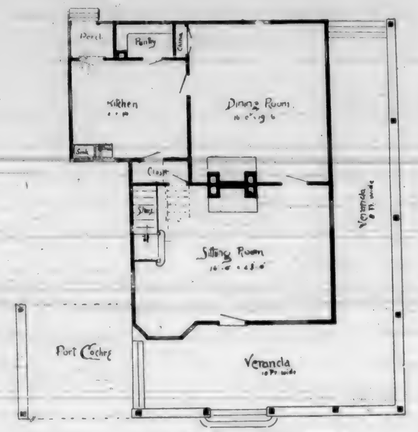
The St. Louis Chapter forwarded a copy of their Constitution and By-Laws, for which due acknowledgments were expressed.

At the evening session, Mr. Geo. W. Percy read an interesting and instructive paper on his experiences in the use of concrete in building construction, and in the discussion that took place after the reading, many points were more fully entered into.



A COUNTRY COTTAGE.

The California Architect and Building News, San Francisco, Cal., is making strides of progress that speaks of much energy and ability. The selection of illustrations are admirable for their useful studies and assistance offered to the profession of designing and planning, from a modest country cottage to palacial structures.—*The Chicago Clay Journal.*



LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

Homestead Exempt from Mechanic's Lien.—A parol agreement to pay for materials used in the repair of a house on homestead premises is insufficient to charge the homestead with a lien for such materials.

Burtch v. McGibbon, Supreme Court of Mich. 56 N. W. Rep. 1110. 34.

Liability of Acceptor of Orders.—The acceptance of an order payable out of the last payment to become due on a building contract is enforceable against the acceptor, though the last payment never became due, where it was prevented from becoming due by the fault of the acceptor.

Mersereau v. Villari, Supreme Court of N. Y. 26 N. Y. Supp 135. 47.

Forfeiture of Wages in Contract of Employment.—A contract of employment which stimulates that the employee, if he leaves the service without giving three days notice, shall forfeit all moneys owing him, provides for a penalty, and not for liquidated damages. Schmieder v. Kingsley, Common Pleas of N. Y. City and County, 26 N. Y. Supp. 31. 38.

Evidence of the Value of Services of Architect.—In an action for services as an architect, in drawing plans, the issue being as to the amount to be paid, according to agreement, the introduction of other plans in evidence was, at most, harmless error, testimony of a witness that he had obtained good plans of an architect for a less sum than that proved to be a customary rate of charges of architects, was properly excluded.

Cooper v. Gorgon, Court of Civil Appeals of Texas, 23 S. W. Rep. 608. 76.

Transfer of Material Man's Account Destroys Lien.—The transfer by a material man to another party of his account for materials furnished in the construction of a building, before the filing of his claim for a lien, destroys the right to a lien, and confers no authority upon the assignee to file and enforce a mechanics' lien for such materials. The assignee, after such assignment, cannot perfect the lien by complying with the requirements of the statute.

Noll v. Kenneally, Supreme Court of Neb. 56 N. W. Rep. 722. 91.

Failure to Procure Architect's Certificate.—Final payment of the sum due a sub-contractor, from a builder for work performed cannot be refused on the ground that the sub-contractor had failed to procure an architect's certificate, as to the proper performance of his work, as required by the contract, where the architect has certified that the sub-contractor is entitled to a settlement, but without prejudice to any claim the builder might have for time lost or work done in carrying out the terms of the contract.

Grannis v. Hurd Lumber Co. v. Deeves, Supreme Court of N. Y. 2 N. Y. Supp. 375. 91.

Damages for Breach of Contract.—Where one had contracted to build an ore dock according to certain plans, and to complete the same by the first of May, the timbers required for the work were of peculiar and unusual dimensions, and in order that the workmen be kept employed, it was necessary that the timbers be furnished at certain times; and as the dock had to be built in and over the water, it was necessary to an advantageous performance of the work that it be done while the ice remained on the water. In January a party with knowledge of these facts, agreed to furnish all the timber for the work in three monthly installments, his contract containing a provision that, "in the event of his inability to furnish all or any of said timber as proposed above, he agreed to allow the contractor to purchase the same in the open market, and charge the necessary expense to his account, the same as if he himself had purchased it." This did not amount to a stipulation for an exclusive measure of damages in case of a breach of the contract.

Williston v. Matthews, Supreme Court of Minnesota, 56 N. W. Rep. 1112. 175.

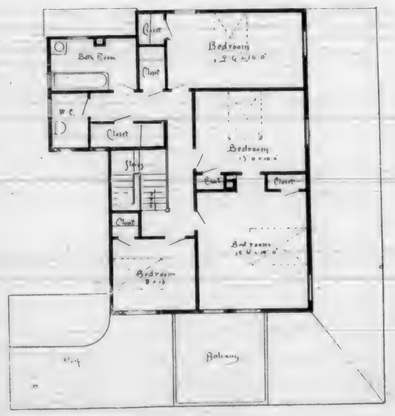
TENDERS TO BE RECEIVED.

Treasury Department, Office Supervising Architect, Washington, D. C., February 8, 1894. Sealed proposals will be received at the office of the Custodian of the U. S. Custom House, etc., and Old Appraisers' Stores buildings at San Francisco, California, until 2 o'clock P. M. on the 15th day of March, 1894, and opened immediately thereafter, for furnishing all the labor and materials required for the repairs, painting, etc., of above named buildings, in accordance with the specification and instructions of the Custodian. Copies of the specification may be had on application at the office of the Custodian at the buildings. Each bid must be accompanied by a certified check for a sum not less than 2 per cent of the amount of the proposal. The right is reserved to reject any or all bids, and to waive any defect or informality in any bid should it be deemed in the interest of the Government to do so. All bids received after the time stated for opening the same will be returned to the bidders. Proposals must be enclosed in envelopes, sealed and marked, "Proposal for Repairs, Painting, etc., of the U. S. Custom House, etc., and Old Appraisers' Stores Buildings," and addressed to,

Mr. John H. Wise,
Custodian.

Treasury Department, Office, Supervising Architect, Washington, D. C., January 29, 1894. Sealed proposals will be received at this office until 2 o'clock P. M. on the 7th day of March, 1894, and opened immediately thereafter, for all the labor and materials and fixing in place complete the low pressure, return circulation, steam heating and ventilating apparatus required for the U. S. Post Office, etc., building at San Jose, California, in accordance with the drawings and specification, copies of which may be had at this office or the office of the Superintendent at San Jose, California. Each bid must be accompanied by a certified check for a sum not less than 2 per cent of the amount of the proposal. The right is reserved to reject any or all bids and to waive any defect or informality in any bid, if it be deemed in the interest of the Government to do so. All bids received after the time stated will be returned to the bidders. Proposals must be enclosed in envelopes, sealed and marked, "Proposal for the Low Pressure, Return Circulation, Steam Heating and Ventilating Apparatus for the U. S. Post Office, etc., building at San Jose, California," and addressed to,

Jeremiah O'Rourke,
Supervising Architect.



BOOKS AND PERIODICALS.

It is always interesting to read the impressions made upon foreigners on a first visit to America and in NOTES ON MY VISIT TO AMERICA a paper read by C. J. Cuthbertson, Common Councilman of the City of London, we have an account of the effect made upon a Londoner.

Here we have what struck him most strongly in New York:

"During our first walk we noticed the shops were large, bright and attractive. Many tramcars running, some drawn by horses, others by cable. Omnibuses few, drivers and conductors clean, smart and noisy; but the former are bad coachmen. Horses very lightly harnessed. Traps and carts very lightly made swarm in the streets; the most popular being the four-wheeled "buggy" Altogether a place of business, bustle and noise, is the first verdict of the new comer. New York is well planned, the streets run in parallel lines, and mainly distinguished by numbers. The houses very high, commonly rising six or eight stories, and built in blocks. In running up new houses, a foundation is prepared; an entire framework of iron erected, which is afterwards filled in with brick or stone, as required. In one of the squares a building was noticed with a frontage of white marble, producing a remarkably rich effect. Electric light advertisements here and there were very fine; in one instance four different lines of matter being displayed in as many different colours. The elevated railways running through the streets level with the first floors of the houses attracted attention. Although awkward in appearance, and in some cases injurious to business, by blocking the light from the shops before which they pass, they are yet found helpful to others, as they run every minute, stop at certain street corners, and the terminus only, thus giving great facilities to buyers in and around their neighbourhood. *En route* I was much amused at the free and easy attitude of the ticket collector, who was sitting in an armchair, with feet resting well up, coolly looking on while our tickets were placed in a box in front of him. All tickets by rail or car in New York are of the uniform price of 5 cents, and all of same class. The railway carriages are of light construction, while the railways themselves are almost unenclosed. Leaving Fifty-fifth street, I walked to Central Park, and was much struck by its extent and beauty. Within it is a large and excellent Zoological collection, open to all free of charge. Returning to the city, I noticed among the stores that of Stuart, which consists of an entire block, containing about a hundred separate shops. In New York we met with our first monetary experience, the most popular currency here being the Dollar Note, and one felt momentary surprise, when called upon to part with a *note* for 4s. 2d. The principal coins in use are ½ dollars, ¼ dollars, 10 cents and 5 cents. Weather was now very hot; majority wearing straw hats, otherwise in dress our cousins presented the appearance of quiet English gentlemen. Dress generally is here very expensive. Passing down Eighteenth street I paid a visit to the Fire Engine Station. The Captain informed me that in case of an out-break, everything could be got ready and despatched in *nine seconds!* Subsequently at drill we saw this feat accomplished."

It is evident by the following that natural wood finish is not so common in England as here.

"The blocks of mahogany and walnut were enormous, and the specimens from Australia, Canada and California very good. Speaking of woods, I observed that where this material is used for interiors of houses it is simply planed and polished, or varnished, seldom or never painted."

The author's remarks anent the Electricity Exhibit at the World's Fair indicate that nowhere in the world has such an advance been made in its applications as in this country.

"We next visited and revisited the *Electricity Building*. This fairly astonished and entranced me. It baffles description. The American seems to be perfectly at home with the new light. Electricity is seen in all forms and devices on buildings and in streets, the effect in many cases being brilliant and imposing; the illumination of the grounds, statuary, boats, etc., by night was simply grand. On the summit of one of the buildings is an electric search light, which can be seen a distance of forty miles."

He thus curtly dismisses the tall buildings of Chicago with several notes of exclamation.

"As to the city itself, Chicago is noisy, bustling and busy. It is noted for containing the tallest houses in the world. I was invited to a Masonic Lodge on the *eighteenth story!* the house itself having no fewer than *twenty-two!!*"

And winds up with the following tribute to the American character.

"Among our thoughts on the homeward trip was this, that, with the exception of a little extra smartness and alertness, our American cousins are, after all, one with ourselves; and personally I am bound to say that the kindness and courtesy uniformly extended to me in the States contributed greatly to the pleasure of a most enjoyable holiday."

LIPPINCOTT'S MAGAZINE for February, 1894. The complete novel in the February number of Lippincott's "The Picture of Los Cruces" is hardly up to the standard of the novels published in this magazine—the varied contents in other departments, however, will make it an interesting number to the general reader.

ELECTRICAL LITERATURE.—A monthly summary of current literature, Volumn 1, No. 1. Published by Fred De Land, 565 The Rookerey, Chicago, is intended to supply a brief synopsis, in a classified form, of each important article and editorial that may have any bearing on any phase of electrical engineering appearing in any publication, either American or foreign. While their publication cannot fail to be of great use to the Electrical Engineer and students of electricity; we fear the general public who care only for results accomplished, cannot be relied upon to support such a publication, upon reflection we may be saying too much, as there is a vast number of the public who are interested in this subject.

THE POTSDAM RED SANDSTONE CO., have favored us with a very artistic calendar for 1894. They enclose at the same time a report and an excellent likeness of the late Dr. Newberry and other experts of note.

The Potsdam Red Sandstone is doubtless all these expert says, but an account of the distance and cost of transportation has not interested the architects of this coast and those interested in building as it otherwise would. Beside this there is a feeling growing up in this community that we should look at home for building material. Encourage home industry, is getting to be the cry, and eventually it will be found we have building stone and marbles in our own state that cannot be rivaled or excelled.

BUSINESS MOSAICS.

Vulcan Iron Works.—Those in want of Architectural and Ornamental Iron Work cannot do better than give this company a call. To see the dainty stable fixtures will make you wish to build a new stable at once, or at any rate to remodel your old one; why a horse provided with such fixtures in his stable holds his head a trifle higher and looks down with contempt upon the unfortunate animals who do not have his advantages. Do not allow the feelings of your favorite horse to be hurt through the want of fixtures which are cheapest in the end—as they last long and save feed.

Teacher—"Try to remember this: Milton, the poet, was blind. Do you think you can remember it?" "Yes, ma'am." "Now, what was Milton's great misfortune?" "He was a poet."—*American Grocer.*

Ruffino & Bianchi, importers and manufacturers of marble, granite, monuments, tombs, wainscoting, steps, tiling, etc. The good taste displayed by this firm, in a department that more than most others appeals particularly to sentiment and feeling should be a sufficient reason for crowding their works to their utmost capacity. Call and judge for yourself at 862 to 870 Bryant street, San Francisco.

Cholly—I—I called to ahsk—er—er— Her Papa—Yes, yes; you may have her! Take my blessing!! This is my busy day!! Get out!!—*Puck.*

We recently has a visit from Mr. W. S. Purnell, the travelling representative of Merchant & Co. of Philadelphia, whose specialties we have frequently noted in these columns. Merchant & Co. continue to hold their own against numerous competitors by the excellence of their goods. About two hundred of the Star Ventilators will be used in the erection of the New French Hospital in this city, they having been chosen as being the best as well as the most economical.

Englishman—"Beastly weather, h'isnt h'it?" American—"Humph! The only creature that would like this weather is a duck, and a duck isn't a beast; it's a fowl. This is foul weather."—*New York Weekly.*

The Samson Cordage Works of Boston have issued their 1894 Catalogue and call especial attention to their "Samson Spot Cord." This cord has been put on to the market the last year to supply the demand that the Architects have made for a first quality Sash Cord which should be so marked that it could be identified at sight after the label has been removed from the low grade cords which are bought on account of the low price rather than on account of their wearing qualities. The "Samson Spot Cord" is the same quality and price as the regular "Samson" Cord, which has for years been so favorably known marked with a succession of a different color from the body of the cord. The company has adopted this device as a trade mark. Their catalogue describes this cord as being warranted of perfect braid and finish, and to be entirely free from waste stock, and purchasers may have confidence that the spot is a guarantee of quality. Samples will be gladly sent on application.

The Rapid Safety Filter.—To those who wish to retain good health, be wise in time, and order a Rapid Safety Filter, the office of the company is at 1209 Market street. These filters are endorsed by the leading physicians who strongly recommend their use. No charge is made by this company for fitting, keeping in order and cleaning the filter; the charge is very moderate and includes all these points, see their advertisement on page XII this journal. If you once commence with their use you are sure to continue it.

"Be mine, Amanda, and I'll treat you like an angel." "I daresay! Nothing to eat and still less to wear!"—*News Letter.*

Infringement of the Star Ventilator.—In the Omaha *Sunday World Herald*, of December 17th, appears a paragraph in regard to an alleged infringement of the patent of Merchant & Co.'s Star Ventilator. It would seem that the Star Ventilator was specified for the Lincoln, Neb., Hospital for the Insane and that the contractor placed other ventilators in the building which Merchant & Co. claimed to be infringements on their Star patents. Steps were accordingly taken to stop payment on the work pending an investigation. The matter was duly laid before the State Board of Public Lands and Buildings, with the result that the board decided to withhold a settlement with the contractor until he had made a satisfactory settlement with Merchant & Co. We are informed that Merchant & Co. have recovered heavy damages in the case.—*Metal Worker, January 6, 1894.*

"New York is a great place," said the tourist. "It has an Italian quarter, and a Chinese quarter, and a French quarter, but where is the American quarter?" "In the pocket of the hotel waiter," answered his American cousin.—*News Letter.*

Bolton & Strong.—The beautiful half-tones we have published of late were executed by these Photo Engravers, 430 Pine street, San Francisco. There is no doubt these gentlemen stand at the front in this class of work on this coast, indeed they do not take a back seat if we look the country over from east to west. Calling in the aid of the electric light they can work regardless of the state of the weather, clouds or sunshine.

"Why, oh why, do all men join in the mad rush for gold?" shrieked the female lecturer, who had acquired many years but no husband. "Because," yelled a voice from the back rows, "they have to do it to keep the women in clothes!"—*News Letter.*

Dunham, Carrigan & Hayden Co.—Builders' hardware in endless variety, including a complete line of Hopkins & Dickinson Manufacturing Co's Bronze Hardware, indeed, a visit to their bronze art room will well repay one, if only to see the various useful inventions, combining artistic taste with the every day essentials required by every builder. As dealers in hardware, iron and steel this firm are so well known, it is hardly worth while to say their establishment will be found at 17 and 19 Beale street, as well as 18, 20, 22 and 24 Main street, San Francisco, Cal.

Forgetfulness is a common failure of humanity, and everything that helps us to remember easily receives our hearty endorsement. Of just such a character is the "Daily Reminder," which the Bostwick Steel Lath Company, of Nilss, O., are now sending out to their friends and patrons with the compliments of the season for a Merry Xmas and a happy and prosperous new year. This little book is a complete diary and calendar combined, giving the day of the month, the day of the year, holidays, etc. Of course the company are anxious that reference to its pages shall also remind the reader that the Bostwick fire-proof steel lath is the best on the market and should be investigated by architects, plastering contractors and others who are trying to find a good lath to put into their buildings. This lath was awarded a premium at the World's Fair.

"It's very hard," said the water-meter, "I'm always registering, but I can't vote!"—*News Letter.*

The truth of the saying "the works of a good man lives after him" is illustrated by the success of the Joseph Dixon Crucible Company, though greatly enlarged and improved since his death the same spirit governs the concern as when he lived, and the march of improvement is ever onward.

The sight of an excellent likeness of the late Joseph Dixon, reminds me of an occurence that happened some years before his death, it gives a very good illustration of the fun that lurked under a somewhat austere countenance.

About the time when Pains claim of a great discovery was the talk of the day, and some people were ready to believe t a revolution in gas making from water was about to b a certainty, Mr. Dixon announced a lecture upon the subject of Pains water gas, and proceeded from the platform to apparently perform the experiments that Pain had announced with a flourish of trumpets; water was decomposed, the gas collected, afterward carbonized and burst before the delighted audience. Mr. Dixon bowed his acknowledgments—"I should say before you go—there is one little point of difference, my machine is of wood though the magnets are painted to represent iron." Up jumped an indignant man and said, "If that is so I pronounce the thing a humbug." "You have characterised it exactly, the object of the lecture is accomplished," replied Mr. Dixon.

CITY BUILDING NEWS.

Carl near Cole. Two-story frame; owner, Wm. Lang, Jr.; architect, Emil John; contractors, Schutt & Krecker; signed, Jan. 17; filed, Jan. 19; cost $3700.

California near Sansome. Alteration; owner, Josie Guarcola; architect, Clinton Day; contractor, J. H. Wilson; signed, Dec. 4; filed, Jan. 31; cost $3,250.

California street, No. 1919. An annex, theatre and ballroom; owner, M. H. DeYoung; architect, A. Page Brown; contractors, Mahoney Bros.; cost $10,000.

Commercial and Leidesdorff. Repairs to brick building; owners, Howard Estate; contractor, J. V. Lawrence; cost $3350.

Commercial bet. Leidesdorff and [illegible] Repairs to brick building; owners, Estate of Capt. Thomas; contractors, Mahoney Bros.; cost $10,109.

Clayton near Waller. To build; owner, L. F. Crane; architect, John Conant; contractors, McCulloch & Glunz; signed, Jan. 23; filed, Jan. 25; cost $2055.

Devisadero near Grove. One-story frame; owner, Mrs. M. Mocker; architects, Percy & Hamilton; contractor, J. House; signed, Jan. 24; filed, Jan. 25; cost $2000.

Ellis and Hollis. Brick, carpenter and mill work, etc.; owner, Blanche Converse; architects, Shea & Shea; contractor, Ed. Mooney; signed, Jan. 15; filed, Jan. 20; cost $10,570.

Ellis and Hollis. Sewering, plumbing, etc.; owner, Blanche Converse; architects, Shea & Shea; contractor, P. F. Ward; signed, Jan. 15; filed, Jan. 20; cost $1293.

Filbert bet. Hyde and Leavenworth. Two-story frame; owner, Chas. Grasse; contractor, Geo. Welsmann; cost $3800.

Filbert and Taylor. Two-story frame; owner, F. L. M. Peters; contractors, Dean & Worden; signed, Feb. 1; filed, Feb. 1; cost $1900.

First near Minna. Three-story brick building; owner, M. Samuel; architect, Emile Depierre; contractors, John Dunphy & Co.; signed, Feb. 2; filed, Feb. 3; cost $5,200.

Fulton and Webster. Alterations and additions; owner, Elizabeth Moore; contractors, Home Building Co.; signed, Jan. 24; filed, Jan. 26; cost $3600.

Golden Gate Ave. between Lyon and Lott. To build; owner, Joe. Wurdack; architect, Emil John; day work; cost $4000.

Golden Gate Ave. near Lott. To build; owner, John N. Macklin; contractor, Arthur Stevens; signed, Jan. 10; filed, Jan. 26; cost $3320.

Greenwich near Hyde. To build with observatory; owner, Jas. F. Gassmann; contractor, C. A. Henderson; signed, Jan. 18; filed, Jan. 19; cost $3000.

Greenwich bet. Stockton and Powell. To build; owner, Jane Trubody; contractor, E. A. Thompson. signed, Feb. 2; filed, Feb. 5; cost $2600.

Howard near 10th. Two-story frame; owner, H. H. Oelling; architects, Townsend & Wyneken; contractor, F. W. Kern; signed, Jan. 12; filed, Jan. 16; cost $4380.

Howard near 5th. Excavating brick and carpenter work tinning, etc.; owner, H. W. Frank; architects, J. C. and E. A. Mathews; contractor, D. J. Breman; signed, Feb. 7; filed, Feb. 10; cost $10,300.

Jackson near Laguna. Carpenter, mill work, etc., owner, Samuel M. Rosenbaum; architect, Samuel Newsom; contractor, Martens J. Gallagher; signed, Jan. 29; filed, Jan. 31; cost $8850.

Jackson near Laguna. Sewers, plumbing, etc.; owner, Samuel M. Rosenbaum; architect, Samuel Newsom; contractor, Samuel Ichelheimer; signed, Feb. 2; filed, Feb 3; cost $1435.

Leidesdorff and Clay. Repairs to brick building; owner, E. J. Shattuck; contractor, A. C. Hussey; cost $1600.

Lott near Golden Gate Ave. A frame dwelling; owner, Mrs. Flora Ellon; architect, J. Cather Newsom; contractor, Louis Landler; signed, Jan. 23; filed, Jan. 25; cost $6,159.

Lombard and Greenwich Alley. Alterations and additions; owner, P. Castagnetto; architects, Townsend & Wyneken; contractor, C. Paff; signed, Feb. 9; signed, Feb. 10; cost $2700.

Market and Montgomery. Hardware interior; owner, Union Trust Co.; architect, Clinton Day; contractors, Mahoney Bros.; cost $1800.

Market and Montgomery. To build; owners, Union Trust Co.; architect, Clinton Day; sub-contractor, L. & E. Emanuel. cost $6150.

Market and Montgomery. Mill work; owner, Union Trust Co.; sub-contractor, Andrew Wilkie; cost $800.

Pacific Ave. near Laguna. Alterations; owner, J. A. Carit; architect, T. J. Welsh; contractor, W. F. Wilson; signed, Feb. 2; filed, Feb. 12; cost $1016.

Pacific Ave. near Laguna. Painting, etc.; owner, J. A. Carit; architect, T. J. Welsh; contractor, M. J. Donovan; signed, Feb. 9; filed, Feb. 12; cost $1670.

Pacific Ave. near Octavia. Two-story frame; owner, Mrs. Johanna D. Jolliffe; contractor, Willis Polk; signed, Jan. 25; filed, Jan. 29; cost $4700.

Pacific Ave. near Laguna. Brick work, art stone, etc;; owner, J. A. Carit; architect, T. J. Welsh; contractor, J. W. Smith; signed, Jan. 31; filed, Jan. 31; cost $7895.

Post near Leavenworth. Painting, etc.; owners, S. F. Verein Association; architects Sulfield & Kohlberg; contractor, H. F. Wagner; signed, Jan. 11; filed, Jan. 18; cost $2350.

Powell and Jackson. To build; owner, Second African Methodist Church; architect, H. Geilfuss; contractors, Brutcher & Griffith; signed, Jan. 20; filed, Jan 20; cost $4,765.

Pine near Buchanan. To build; owner, Louis Freelander; architect, J. F. Sherman; contractors, Currie & Loomer; signed, Feb. 5; filed, Feb. 6; cost $3825.

Powell bet. O'Farrell and Geary. Alterations; owner, Geo. B. Tay; contractor, Wm. Little; cost $4250.

Scott near Page. To build; owner. Geo. H. Luchsinger; architect, H. Geilfuss; contractors, Schutte & Krecker; signed, Jan. 20; filed, Jan, 20; cost $3500.

Tremont Ave. near Fredrick. One-story cottage; owner, Geo. Offerman; architect, Emil John; contractors, J. A. McDonald & McDonald; signed, Feb. 2; filed, Feb. 6; cost $2000.

Van Ness Ave. and Myrtle. Painting and tinning; owner, C. F. Buckley; architect, M. J. Lyon; contractor, L. J. Dwyer; signed, Feb. 6; filed, Feb. 10; cost $2593.

Van Ness Ave. and Myrtle Ave. Grading concrete foundation, brickwork, etc.; owner, C. F. Buckley; architect, M. J. Lyon; contractors, Martin & James Fennell; signed, Feb. 6; filed, Feb. 8; cost $7250.

Van Ness Ave. and Myrtle Ave. Plumbing, etc.; architect, M. J. Lyon; contractors, Ford Bros.; signed, Feb. 6; filed, Feb. 9; cost $2000.

Van Ness Ave. and Myrtle Ave. Carpenter and iron work; owner, C. F. Buckley; architect, M. J. Lyon; contractors, Wm. Knowles and Geo. Reichley; signed, Feb. 6; filed, Feb. 9; cost $26,000.

Vallejo near Buchanan. To build; owner, Louis Holy; architect, H. Geilfuss; contractor, James McLean; signed, Feb. 2; filed, Feb. 2; cost $4194.

Virginia near California Ave. One-story frame; owner, E. Powers, contractor, James J. O'Brien; signed, Jan. 19; filed, Jan. 19; cost $1200

Virginia near California Ave. One-story frame; owner, Michael Mahoney; contractor, James J. O'Brien; signed, Dec. 2; filed, Jan. 19; cost $1200.

ESTABLISHED 1879. INCORPORATED 1889

NOW IN THE FIFTEENTH YEAR.

W. J. CUTHBERTSON, President. OLIVER EVERETT, Secretary.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

THE American Institute of Architects has been making strenuous efforts to bring about a reform in the Government's method of designing and erecting the Federal buildings of this country.

The Secretary of the Treasury, has at present, control of all buildings of this class, and the actual work is done by a bureau in charge of a Supervising Architect.

At the earnest solicitation of the American Institute of Architects, Secretary Carlisle promised the Committee that waited on him, that he would try the competitive method if Congress would authorize it; so the Committee prepared a bill and the last Congress made it law, authorizing the Hon. Secretary of the Treasury to procure designs for public buildings through public competitions, as advocated by the Institute.

No action was taken under this authorization. Not long ago the Government had occasion to erect a public building in Buffalo. The design adopted was severely criticized by the Buffalo Chapter of the Institute who protested against the adoption of a design which they characterized as unsuitable and unworthy of the purpose for which it was designed and the occasion was taken by President Burnham of the Institute, to urge on Secretary Carlisle the exercise of his prerogative.

Secretary Carlisle has positively refused to do so, and the reform appears to be no nearer realization than before.

This refusal of the Secretary to take action in the matter is really discouraging—the evils of the present system are admitted, but instead of trying to ameliorate them, the authorities seem determined to plod along in the old way.

The Institute has endeavored for years to secure proper recognition for the noble art of architecture, and is bound to succeed in the end.

In the mean time it is justly indignant that its exertions have met with no better appreciation by the government officials, and in concluding the correspondence with the Secretary of the Treasury concerning the law as it now exists, President Burnham uses this sentence:

"You now inform us, in effect, that the law must be amended before you will act under it. I can see but one amendment which is needed to insure the satisfactory working of this measure; *i. e.*, the introduction of a clause ordering the Secretary of the Treasury to carry out its plain intent and purpose, and not leaving it to his discretion."

The Hon. Secretary of the Treasury seems to consider the method that has produced some of the noblest monuments of the old world, as not worthy of trial in this country, and refuses to learn through the experiences of other nations.

We have no intention of reflecting on the professional ability of the incumbents of the office of Supervising Office of the Treasury, past or present, they have undoubtedly done the best they could under the unfavorable circumstances in which they work.

But think of it! Is is not ridiculous to expect that any one man is able of attending to and designing and erecting all the public building necessitated by the requirements of

a nation of sixty millions—even the layman should see the absurdity of expecting any one man, no matter how capable, to achieve such a task in as satisfactory a manner, as if the combined abilities of the foremost men in the profession were employed to the same end.

We extend to the American Institute of Architects our hearty good wishes and encouragement in their work of securing fitting recognition for a noble art, that was better appreciated centuries ago by an earlier, and we regret to think, possibly a more enlightened civilization.

FUTURE SUPPLY OF SKILLED LABOR IN THE BUILDING TRADES.

PRESIDENT Hersey, in his address at the recent convention of the National Association of Builders, in Boston, pays much attention to the question of future supply of skilled labor in the building trades. He bewails the decay of the apprentice system, and favors among other remedies, the establishment of trades schools. It is to be hoped that so much of the address may bear fruit in inclining some of our wealthy people who are desirous of leaving monuments of their philanthropy, to see in this comparatively new field a chance to do the right thing. It is high time that charitably disposed people inquire if there are not other and more promising openings for their bequests than hospitals and so-called higher institutions of learning. It is true that the public schools are doing more than formerly in the direction of manual training, but it is impossible for them to do much in the way of serious preparation for the shop. Manual training is to be encouraged as helping in the direction of a better balanced education, or at the worst, as a recreation to the pupil. It cannot teach how to do the work required in the trades. Some very limited attempts to revive the apprentice system have of late been made with fair success, but there is slight chance of the revival becoming general. Trade schools have not as yet been sufficiently tested to have established an unassailable reputation, but there is a pretty general belief that they must be pretty poor not to be an improvement on the present state of things. In a sense, much less is required of a mechanic now than formerly, so much machinery, and so much specialization of work being the order of the day. Naturally enough one would expect to get a higher order of work from men of whom but a few things were required; but the expectation is not borne out in the building trades of to-day. The architect, if a good superintendent of construction, finds it necessary to establish a sort of trades school on a considerable percentage of his buildings. From the laying of the footing stones to the finishing of the building, he finds men, who, with drawings and specifications before them, and with plenty of the best of building materials, will not get good results without much special effort on his part in the way of actual teaching. It certainly was different under the old system of apprenticeship, for a mechanic who was "dragged up" as a "cub" in those days certainly knew how to do a good many things well. While an apprentice, he was usually taken in hand by a journeyman, who while he required a great deal of drudgery, took a commendable pride in seeing that he got into the way of doing things well, and once being able to do a thing properly it was not advisable for him to relapse. It was then a merit to get a good job out of indifferent materials, whereas now one is so often discouraged in attempts to get good work from men provided with the best of materials. With so much better scientific knowledge at our disposal than formerly, the whys and wherefores may be placed at the disposal of the pupils of trades schools, and along with the reasons for good work, a degree of skill may be taught that will be very helpful. If we may reason from the results of the schools in departments of design, trade schools cannot come too soon. As to President Hersey's other principal remedy for the degradation of skilled labor, the stopping of foreign immigration, he would have done well to give the subject more careful study, and not to have proposed it at all. The effect of the discontinuation of immigration would be very likely to leave us in a position to see some of our own shortcomings a little better, perhaps, which would be well enough in its way, although not exactly what we most desire; but it would, we fancy, leave us very short of help as a general thing. As the case now stands we would in a normal business season be at a great loss to carry on the building operations of the country if we were to insist on using only native workmen, who, although they may be very superior to all others, may certainly learn some things yet, even from those of foreign birth who do so much of the skilled work about buildings, and many of whom certainly rank well in their several trades.—*The Architect, Builder and Decorator.*

DETAILING OF THE ROOF TRUSSES FOR THE MANUFACTURERS AND LIBERAL ARTS BUILDING, CALIFORNIA MIDWINTER FAIR.

BY D. E. CONDON, M. E., C. E., A. M. INST. C. E., MILLS BUILDING, SAN FRANCISCO.

IN dimensioning the various members of the roof trusses designed for the Manufacturers and Liberal Arts Building of the California Midwinter Fair, and proportioning their connections, the primary essentials were:—

FIRST—A determination of the strains due to the *dead loading;* that is to say the entire weight of the roof material, purlins, etc., in one *panel* or space between two trusses, including the weight of one truss itself, regarded as symmetrically distributed.

SECOND—A determination of the strains due to the probable maximum *wind force* acting on one side of the roof surface.

THIRD—A determination of the maximum strains due to the *combined* action of the dead loading and wind force.

There are seventeen trusses in the entire length of the building, spaced twenty-two feet between centres, and twenty-two feet between each end truss and the adjoining gable.

The roof proper is a cylindrical surface of inch boarding, broken at the crown by a skylight; and its weight is carried to the trusses by means of 4″x12″ purlins over twenty-two feet long and spaced two and a half feet between centres.

The *dead loading* was estimated at twenty pounds per square foot of roof surface, and the resulting *dead loads* at the *upper panel points* A, B, C, D, E. D′, C′, B′, A′, (see accompanying diagram of truss) were determined accordingly. The corresponding strains were then computed.

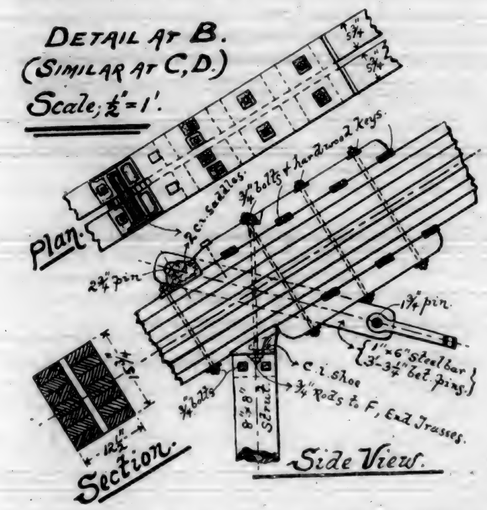
The *wind force* (acting horizontally) was taken at a maximum of thirty pounds per square foot on a plane surface at right angles to its direction; and on this basis the *magnitudes and directions* of the resultant wind forces at the upper panel points A, B, C, D, E, on the wind side were also determined. The strains due to these forces were then computed for the various members both on the wind and lee sides.

By a proper combination of the latter strains with the dead load strains, the *maximum* tensile and compressive

strains to be provided for in designing the various members and their connections were arrived at.

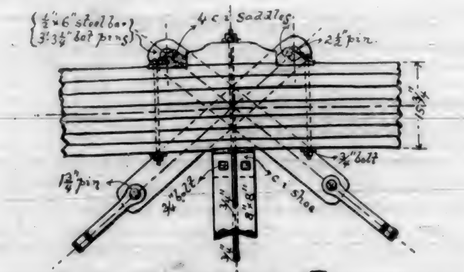
All the compression members were made of white pine wood.

The top A C E C′ A′ (commonly called "upper chord," after the corresponding member or upper flange of girders) was designed to directly sustain the roof purlins, and consequently had to be made circular. The material used being wood it became necessary to form the arc of a laminated or built beam, with scantlings of thickness and length properly proportioned to the curvature, breaking joint and bolted together every two feet. See annexed *Detail at B.*

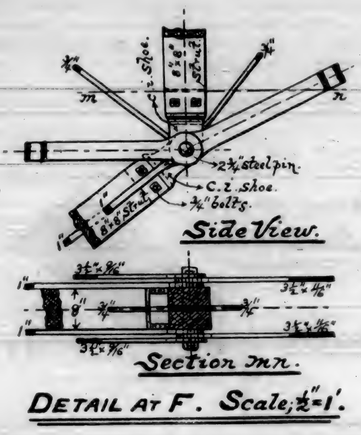


The division of the laminated beam into two equal parts with a space between, provided for the connection of the other members to it, and gave scantlings which could be more easily obtained in the market, without at the same time reducing the strength.

The vertical struts BF, CG, DH, EK were made of square section, with a cast-iron shoe at upper end, slightly gained into the lower lamina of beam, and bolted to both beam and strut. See *Detail at B*, and annexed *Detail at E.*



The lower end of each of these struts was also provided with a cast-iron shoe, similarly bolted to the strut, and having two sufficiently strong webs or ribs (1″ metal) projecting downwardly, four inches apart, with holes through which the pin is passed that makes the connection with all the tension members at the point. See annexed *Detail at F.*



The vertical struts M L, M′ L′ were not provided with a cast-iron shoe at upper end; but the end was gained one-half inch into lower lamina, and tenoned between the two halves of the laminated beam. The lower end of each of these struts was provided with a cast-iron shoe, similar to that at F, G, H, K, (but smaller, ¾″ metal) with a 1¾″ pin connecting *all* the tension members at the point.

The oblique struts F P, F′ P′ were provided with a cast-iron shoe at upper end, same as that at the lower end of the vertical strut at same points, only the projecting eye-ribs are six inches apart. The lower end of each of these struts has no cast-iron shoe, but is gained into and secured between the two 12″x12″ upright posts (six inches apart) of the side frame-work.

All the main tension members were made of steel—flat eye-bars and rods—each proportioned to its maximum strain, with a factor of safety of about three (3) within the elastic limit of the material.

The secondary bracing members (a F, F b, etc.) were all made of ¾″ wrought-iron rods.

The connection of the members at the various points were all made by means of turned steel pins properly proportioned to the maximum shearing and bending strains.

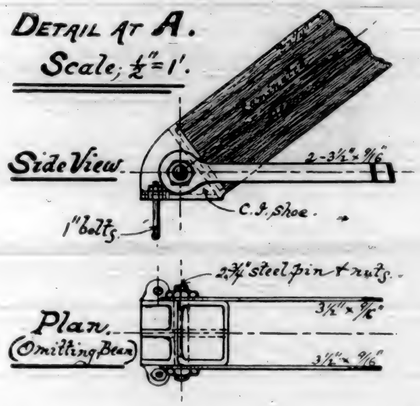
The connection between the diagonal tension members and laminated beam at B, C, D were made by means of a flat steel bar (1″x6″, 3′3¼″ between pin centres) with pin connection between the two member-flats at its lower end, and a pin bearing on two cast-iron saddles at its upper end. See *Detail at B.* The bar passes up between the two halves of beam, and each saddle is slightly gained into and bolted to the half-beam on which it is secured. The component tendencies to sliding along the beam, of the saddles and upper shoe of strut, are mainly counteracted by means of two pieces of wood extending across, and bolted through and keyed to, the two halves of beam. The upper piece has its end opposed to the faces of the saddles, and the lower one has its end opposed to the face of strut shoe. Each saddle is prevented from side movement at the same time by the bolt at its back end, and a projection at the face end which enters the upper lamina of beam.

The connection at the crown E is somewhat different.

The steel bars are only ½" thick, but with the same distance (3'3¼") between pin centres and the cast-iron saddles are smaller. See *Detail at E.*

The connections between the vertical main and secondary tie rods, and the laminated beam were made by means of nuts at ends of rods, with wrought-iron washers seated on and secured to the upper side of beam.

The ends (A, A') of the laminated beam were provided with cast-iron shoe bearings, with pin connection to tension members; and the shoes were firmly bolted down to the supporting frame work. Annexed *Detail at A.*



All the roof purlins were secured to the laminated beam of the trusses, and the beams of all the trusses were connected by a system of ¾" diagonal tie rods.

de,	" "	8'10"	between pin centre and screw end, with forked end at d.

The gable bracing will be described in next issue.

The *California Architect* has published some plates of the buildings of the Midwinter Fair that exceed anything done by their Eastern contemporaries during the World's Fair. The work is most creditable, and the pictures in one number worth the subscription for a year. We, in common with all interested with journalism on this Coast, feel a pride in the *California Architect.* It is made up in a manner that blends taste with the utilitarian in an art that more than any other depends upon an interchange of ideas and thought in an art that is universal, and for that reason, one that restrains the selfish idea of exclusiveness, widens views, and leads to a higher civilization. It is, moreover, marching with rapid strides into the field of computable quantities. The taste that provides external grace remains, but added to this comes the internal engineering problems of electrical apparatus, elevators, provision for steam power, general heating, with many other elements added in the last few years.—*Industry.*

THE OWNERSHIP OF DRAWINGS MADE FOR AND BY AN ARCHITECT.*

A LETTER is a document which, by means of words, attempts to supply to the reader some information from the writer; even after signature this, until delivery to the Post-office, or until delivery by some other means (the difficulties respecting a letter *in transitu* need not here be discussed), is held to be the absolute property of the writer, unless by agreement he has previously parted with that property. After delivery (if there has been no such agreement), either party may by injunction prevent the publication of the document; but before proceeding to that step, in cases where the Post-office is not the medium of transmission, the delivery to the reader or to an agent specially appointed by him to receive the document must be proved by the recipient. An architect's drawing has the nature of a written document, and is invested with all the qualities of a letter, as soon as it has received his signature, or the formula, "To be returned to the office of A. B.," etc., or even "From the office of A. B.," etc. A drawing is any combination of two or more lines which expresses form more clearly than any amount of description could do. In exception to this definition, some persons might produce copies of photographic pictures, and inquire where the lines are to be seen; others might bring forward shadowed representations of buildings in which no lines appear. The reply is, that no man could have made such a copy or such shadowed drawings without first drawing the lines, which have subsequently been erased.

Architectural drawings are technically known as "*sketches*" of plans, or sections, or elevations, or perspective views; *Draught.* (this term is nearly obsolete, because the words "rough plan," etc., are too generally used in an office for "rough draught of plan," etc.), and sometimes scaled to a *modulus;* General Drawings, always scaled to a foot; Detail Drawings, either at full-size or at an aliquot part of that size; Show Drawings, for exhibition to the client, to the architect's friends and to the public; a drawing in any one of these classes may be either "rough" or "finished," but is not necessarily an original design—the words "design" and "drawing" are so frequently used with indifference as to their separate meanings, that it may be useful here to insist that a design means a project, an idea, which may be very good although expressed in a bad drawing, just as, on the contrary, good drawing may be wasted upon a bad design; and copies or repetitions, which may be either counter-drawn by transfer, or duplicates by tracing or by using the rule and compasses, or enlarged or diminished copies produced by hand or by machinery. The term "Working-drawings" once meant the general drawings drawn so large as to show construction, or to admit of minute dimensions to save mistakes by workmen unused to scales; but now all detail drawings may be included. As to Original Drawings, all from which copies are made are original; however, since an assistant's work has been allowed to pass under the master's name, an original drawing by the master is one which he has himself made. Competition Drawings are finished general (and sometimes detail) drawings submitted in competition with other architects; in a few exceptional cases drawings of the design to a small scale have been at first required, and a selection has been sealed, for verification by the advertising body, from which the larger drawings have been made, and again submitted in final competion. Prize drawings are the successful Competition drawings, although the present day speaks of "premiated prize-drawings" when the competition has been made as a scholastic exercise for a small sum of money, or for a medal, or for books, etc., commonly called a "prize."

When the conditions of competition include a provision that the prize-drawings shall become the property of the donor of the premium, without the addition of words to the effect of "on delivery of the premium," the architect enters into a speculation of making drawings for approval, purchase and payment. The drawings on approval become the property of the donor of the premium, who in the present state of the law of artistic copyright has the power to sell, or lend, or publish them forthwith, without fear of any interference on the part of the architect, who must formally sue the donor for the premium as a debt, unless the architect by some indiscretion has deprived himself even of that remedy.

It is clear that a body corporate having a common seal may advertise for competition designs, receive them, approve two or more sets of drawings, and refuse to proceed to the adjudication of the premiums (on the ground that the advertisement was not a copy of a contract made under seal) until a more satisfactory opportunity; yet the architects cannot compel the body corporate to return the approved drawings; and it is doubtful whether they could compel them to proceed forthwith to adjudication and payment; yet the drawings would be legally in possession of the corporation, if not legally its absolute property.

The drawings made by an architect's assistant in the architect's office absolutely belong to the architect until he parts with his property in them, and this whether the assistant be paid (even if there be a debt due to him in respect thereof) or otherwise. This property depends on the fact that the drawings are made on paper, or vellum, etc., provided by the architect. Hence the clause in Articles of Pupilage that the pupil is to provide all instruments and materials except paper.

The drawings made by an architect's assistant out of the office, for the architect, absolutely belong to the architect until he parts with his property in them, even before he has paid to the assistant the price of the work: This property may arise in one of two ways: either the drawings are made on paper or vellum, etc., provided by the architect, in the same manner as a solicitor supplies to his surveyor the parchments on which the surveyor is to make duplicate drawings; or else the drawings have been made on paper or vellum, etc., *provided by the assistant*, and the architect, by agreeing to have them, acquires the property in them; but, in both cases, the assistant has a lien upon the drawings, or any part of them, for the whole price, unless he has agreed to receive the price at a future day, or takes security for the debt.

Not to omit what may at first sight seem to be an almost extinct branch of the subject, it may be observed that a century or more since, when vellum was more used, paper much dearer, and assistance perhaps worse remunerated than at present, agreements as to the usefulness of assistant's work were settled by destroying the material, a habit said to have been preserved to his later years by Sir John Soane, who did not hesitate to ask the assistant for his penknife, with which Soane reduced, at two diagonal cuts, the drawing into four triangles. Even now, the destruction of a pupil's drawing is taken as the strongest mark of the architect's disapproval. But, of late years, the principle *caveat emptor* has been so triumphant that if the architect does not take care too see satisfactory samples of his proposed assistant's skill, he had better not refuse an unsatisfactory drawing, but, (after pointing out the defects and getting them rectified as much as possible) accept, without manifesting displeasure, the finished work which is tendered to him. And if the architect, during the progress of work done out of the office, should see evidence of carelessness, incapacity or ignorance, he had better say that the drawing at that stage will suit his purpose, as if it were completed; and, upon payment even of the price orignally fixed, withdraw it. To leave a drawing under a continuous lien is not satisfactory.

To be Continued.

* During the period when the important subject of the ownership of drawings was under consideration—a question raised by the demand made by the Office of H. M. Works, etc., on the late Edward Barry, for the drawings made by his father in carrying out the designs for the House of Parliament—my brother the late John W. Papworth, undertook to collect the views generally held by members of the profession, and wrote them out with comments. His notes, which were found, at his death, among numerous other papers in his desk, are given in the above posthumous article. See for other articles on this subject, Vol. VIII, N. S., (Journal of the R. I. B. A), pp. 109, 188, 231, 254, 404.—Wyatt Papworth.

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

INTER-OCEANIC SHIP-CANAL COMMUNICATION BY THE AMERICAN ISTHMUS.

Its Geographic and Economic Relations towards the United States.

Portions of a paper read by N. J. Manson before the Technical Society of the Pacific Coast, July 7th, 1868.

MR. President, during the past year, I have expressed through the press some views and opinions upon the subject of inter-oceanic communication. A few of the members of your Society expressed the regret that one of my articles had not been read before this Society. In accordance with a promise made at that time I appear before you to-night asking your indulgence.

"Commerce loves the sea, but it depends for life and health on the land. It derives its sustenance from the rivers and the basins which they drain, and increases the opulence of nations in proportion to the facilities of intercourse which those nations have with the outlets of such basins.

"The three great outlets of commerce, the delta of the Mississippi, the Hudson and the Amazon, are all within 2,000 miles, ten days' sail of Darien. It is the barrier which separates us from 600 millions of people. Break it down and the Atlantic Coast of the United States and the Gulf of Mexico become the focus of the world's commerce." * *

Elevations and Widths of the Isthmus at Possible Points of Transit.

The American Isthmus is for nearly its whole extent a ridge of the Cordilleras. From Tehuantepec, where it joins the expanse of North America, to the Gulf of Darien, where it joins South America, it is in length about 1,230 miles. Its width is out of all proportion to its length. It is more essentially an isthmus than any other narrow neck of land on the globe. If we will compare the mean of the widths of the Isthmus, at Tehuantepec, 143 miles; at Honduras, 161 miles; at Nicaragua, 169 miles; at Panama, 47½ miles; at San Blas, 30 miles, they will give for the breadth of the Isthmus about one-eleventh of its length. Its lowest elevations above sea level, at possible points of inter-oceanic transit, are at Tehuantepec, 754 feet; at Honduras, 2,000 to 3,000 feet; at Nicaragua, 153 feet; at Panama, 287 feet; at San Blas, 1,142 feet; at Caledonia, 1,003 feet; at the Truando-Atrato, 950 feet; at the Napipi Atrato, 778 feet; at the Tuyra-Peranchita, 808 feet. The last five routes are all so mountainous and elevated as to require tunneling from six to ten miles in length. The entire Isthmus has been called an immense causeway, separating the seas while uniting the continents. It is worthy of thoughtful consideration that while the African Isthmus, Suez, is but the center of the Old Continents, the American Isthmus is the center of the oceans.

The opening of navigation through Suez gave a short route inland for Western Europe to the east of the Old Continent. Should this nation, as a nation, open and render free a strait across Central America, we not only join the oceans embracing our country, but we open the two halves of the globe to the enterprise of our people, and there will be accomplished for the people of the United States the most ample and far-reaching achievement of civilization since the creation of the world; or, to quote Humboldt and Maury, an epoch in the history of the universe will stand distinctly marked, and it may be added, that should this channel be permitted to be opened in any other way than by a free, an enlightened, and a liberal nation, its natural guardian and custodian, the clock of the world and of civilization will be turned backward one century at least. * *

Surveys of the Whole Isthmus Directly by the Government.

The Government of the United States, realizing the full importance of an inter-oceanic canal, and acting upon the report of Rear Admiral Davis, sent into Central America its most experienced navigators and engineers, and it expended, in its surveys and explorations, according to De Lesseps, no less than $5,000,000.—*North American Review*, Vol. 130, page 1.

A general attack, in an engineering way, upon all the possible lines of canal transit seems to have been determined upon by Congress.

I. In the first place, Congress caused an instrumental reconnoissance of the Isthmus of Tenuantepec to be made by Captain Shufeld in 1872.

II. In the same year Congress caused to be made, by Commander E. P. Lull, U. S. N., an examination, survey, and definite instrumental location of an inter-ocean canal route from the vicinity of Graytown, via Lake Nicaragua, and thence via the rivers Medio and Grande to Brito on the Pacific Coast. As supplemental to this survey some preliminary observations were made in 1872 by Commander Chester Hatfield, U. S. N.

III. It caused to be made an examination and instrumental survey of an inter-oceanic canal route from Navy Bay to Panama by Commander E. P. Lull, U. S. N., in 1875.

IV. It ordered and caused to be made examinations and surveys from the Gulf of San Blas toward the River Chepo by Commander T. O. Selfridge, U. S. N., in 1870, and caused reconnoissances to be made from the waters of the Chepo towards the Gulf of San Blas by Commander E. P. Lull, in 1875.

V. Under its direction several tentative instrumental surveys in the vicinity of Caledonia Bay, across the Cordilleras, were made by parties under the direction of Commander T. O. Selfridge, U. S. N., 1871.

VI. It caused a barometrical reconnoissance to be made of the "De Puydt Route" by way of the Tenala River, between the Tuyra and Atrato, by a party under the direction of Commander T. O. Selfridge, U. S. N., 1871.

VII. Tentative instrumental lines by the so-called Gorgoza route, from the east coast by way of the Atrato Caracica and Peranchita Rivers, from the west coast via the Tuyra and Cue Rivers across the divide, were made by parties under the direction of Commander T. O. Selfridge, U. S. N., 1871.

VIII. An instrumental examination was made of what is known as the Truando Route by Lieutenants Michler, U. S. A., and Craven, U. S. N., 1856–7. This survey was sup-

plemented by an instrumental reconnoissance of the Napipi and Cuia Rivers, including a reconnoissance of the Atrato River to the town of Quibdo, by parties under the direction of Commander T. O. Selfridge, U. S. N., 1871–1873.

IX. It caused a tentative examination and definite instrumental location to be made of an inter-oceanic canal by way of the Napipi and Doguado Rivers by Lieutenant Fredrick Collins, U. S. N., 1875.

X. Congress caused the work of Commander Lull, at Nicaragua, in 1872–3, to be supplemented by parties under the direction of Mr. A. G. Menocal, C. E., U. S. N., in 1880–1 and 1885–6, the nature of this Government work of Mr. Menocal being an instrumental survey and definite location of an inter-oceanic canal via Lake Nicaragua, including the location of the necessary dams, locks, etc. This later work of Mr. Menocal's being subsequent to all the Government surveys was made after the Government of the United States had determined, through what is sometimes called its high commission, that the Nicaragua Route was the most feasible of all the routes, and the survey was made with the express object of carrying out the provisions of the Zavala-Frelinghuysen treaty. (Government Construction and Ownership of the Nicaragua Canal.) The main provisions of this treaty will be adverted to later.

CRITICISMS OF THE SURVEYS OF POSSIBLE ROUTES.

It has been said of these various routes by Professor Nourse, of the United States Navy one of the very highest authorities on this subject:

I. That Tehuantepec, though possessing large natural and political advantages, requires 140 locks to overcome an elevation of 754 feet, and a feeder 27 miles in length.

II. That the Panama Line is the shortest of all the routes, not involving a tunnel. It is liable to the heaviest of tropical rains, falling in the Culebra section upon a trench nearly 500 feet in depth. It is also liable to the sudden rise of the River Chagres. The climate of Panama is notoriously a physical obstacle, which must be considered in any estimate of the advantages and disadvantages of the route. * *

III. We come now to the San Blas route. Of this route Mr. Nourse says though the shortest of all the proposed routes, the distance from tide to tide being only 19.5 miles, and although the harbors at both termini are exceptionally good, it must be eliminated from the problem of canalization by its demand for a tunnel from seven to eight miles in length.

IV. The Atrato-Napipi Route, fully surveyed by expeditions under Commander Selfridge and Lieutenant Collins, which were supplemental to the extensive surveys under Michler, Craven and Trautwine, must also be eliminated, in the opinion of Mr. Nourse, by reason chiefly of a like demand for a tunnel. The late eminent civil engineer, Trautwine, estimated the cost of a canal by this route at from $300,000,000, to $400,000,000. * * * *

V. The Nicaragua Route. This route has, as a grand interior basin and feeder, a lake of 2,600 square miles (4½ times the area of the Bay of San Francisco). It has a healthier country, and more abundant supplies for construction, than any other route. Its supply of native labor is large; it is better than that of any other route. In works of magnitude in tropical countries this is a most important consideration. Except the Tehuantepec route, it is nearer by 700 miles to the United States and its commerce. Its termini lie without the equatorial belt of calms, and if those termini can be built up and restored they will be easily accessible to sailing vessels. * * *

It has been my purpose to lay before the Society the main features of the various Isthmian routes so that it may be able to form a general judgment of the comparative merits of all. I have dwelt at no great length upon the merits of the Panama Route, nor at all upon the merits of the Eads ship railway at Tehuantepec. They may both be practicable and highly meritorious plans, but I do not consider it necessary at this time to farther occupy the time of the Society with these possible undertakings.

I will state, generally, however, in the language of Professor Nourse, in order to enable the Society to form its opinions, that: "To meet the requirements which commerce, supported by all the advanced appliances of this day imperatively demands, the transit must offer the allurements of a full, uninterrupted, safe and speedy transportation. It must be a water highway, through which the largest seagoing vessels, with a tonnage of even 6,000 or more, may pass without breaking bulk; and, it must be remembered, that all experience proves the justice of the statement that railways and canals are supported by the carriage of different species of merchandise—products of great value and small bulk voluntarily selecting the more rapid channel of the railway, while others choose the maritime route." *

CONSTITUTIONAL POWER OF THE GOVERNMENT TO CONSTRUCT AND OWN AN INTER-OCEANIC CANAL.

At this date it is hardly necessary to remind you that the Government of the United States would have the full constitutional power to construct and own the Nicaragua Canal, and operate it in the interest of its people, in the same way that it has improved the Mississippi and the Great Lakes. Indeed, the very convention which framed the Constitution of the United States, by a vote of eight to three, denied the power to the General Government to grant a charter to a private corporation for the purpose of cutting canals in cases in which the authority of a single State would be insufficient (Madison Papers, 1576.) And the same reference will show that it was the intention of the framers of the Constitution to grant the power to the General Government to do directly for the people that class of work.

The direct improvement by the Government of the harbor of Pago Pago, in the Samoan Islands, and Pearl Harbor, in the Hawaiian Islands; the purchase known as the Louisiana purchase, of Florida, and of Alaska, all furnish ample precedent for the direct action of the Government itself at the Nicaragua Route, either by purchase or under treaty with the Nicaraguan Government.

At one time there were a few who thought the General Government would become too powerful or too corrupt if it directly undertook matters of internal improvement. To those I wish to say that they are repeating the arguments of the private speculators. Your Government has become infinitely more corrupt through going into partnership with private corporations, and vastly more injurious and oppressive to the great body of the people from this single circumstance, than from all others combined. If Government legislators were not allowed to sell everything in sight under the name of a Federal franchise, and pocket the proceeds, the body of the American people would have vastly more than they have at present, and an era of congested wealth in the hands of a few would not be upon us.

THE DEMAND IS UNIVERSAL THAT WE RETURN TO SOUND PRINCIPLES OF GOVERNMENT.

When the several States composing the United States surrendered to the General Government the power "to coin money and regulate the value thereof" (Const. U. S., Art. I, Sec. 8); and to issue its treasury notes and greenbacks (the construction put upon the power by the Supreme Court); and in addition thereto denied to themselves the power "to coin Money; emit Bill of Credit; make any Thing but gold and silver Coin a Tender in Payment of Debts" (Const. U. S. Art. I, Sec. 10); and denied to themselves the further power to raise a revenue by duties on imports—indirect taxation—(Const. U. S., Art. I, Sec. 10); and when they granted this power to the General Government (Art. I, Sec. 8), the several States *did*, under the Constitution, effectively surrender the PURSE to the General Government. Since, then, the General Government confessedly and effectively holds the public purse, the law-abiding people of the United States must naturally and of right look to *it* for all necessary internal improvements for the general welfare. The several States, as we have seen, cannot *directly* construct these works, for they placed the means, their purses, in the hands of the General Government.

The purpose of this grant of the purse to the General Government is, *amongst* other things, that Congress shall have power "to establish postoffices and postroads" (Const. U. S., Art. 1, Sec. 8). "Congress shall have power to regulate commerce among the several States"—*Id.* The purse

and the powers enumerated are granted to the General Government to prevent it from turning the people over, in these particulars, to powerful private corporations, to those whose selfish purpose and whose daily practice is to crush out and enslave the people who must use these avenues of commerce.

These great grants of power, with the necessary means to enter upon and discharge the duty and power, were never bestowed upon the General Government to enable it to abandon the people, in these sovereign, governmental and civilizing particulars, to their natural enemies, to those whose interest it is to make all they can out of commerce. It is a rudimental legal maxim that delegated power cannot be delegated, nor can a sovereign power permanently divest itself of any attribute of sovereignty except by voluntary and total dissolution.

The power in Government of making internal improvements for the benefit of the people is not a power in any country dangerous to liberty. On the contrary, it is the one power, of all others, in a civilized country which, when exercised by Government, is the surest guarantee of liberty, and the real power which prevents the enslavement of the masses of the people by the very strength and knavery of our alleged civilization. It is a power resident in the Government which should protect the people from being turned over, bound hand and foot, to the soulless and the avaricious, to the purchasers of legislation. It is that power which, if exercised strictly and entirely by the Government, is for the general welfare and is truly civilizing.

Those powers which are dangerous to liberty are directly and specially granted to the General Government of the United States. All admit that the power of levying taxes, of raising armies, of equipping navies, and of carrying on war, are specifically granted the General Government.

The purse and the sword are the only instruments that are wanted or can ever be employed for the accomplishment of any ambitious purpose. These having been abandoned to the discretion of the General Government, with what propriety can we apprehend danger from the power to construct a sub-treasury, lay out a canal or road, build a bridge, or improve and join our coasts?

Some one has said: "This would be about as unreasonable as if a lady, who had granted to one of her admirers the name and essential privileges of a husband, should afterwards consider it hazardous on the score of delicacy to accompany him on a journey, or take his arm in a promenade."

Did Cæsar, Cromwell or Bonaparte subvert the institutions of their respective countries by laying out a road or canal in the interest of the people? Did they subvert the institutions of their countries by building up its commerce or by causing general and individual prosperity?

It has been reserved for a people living under the form of a free Goverement to witness almost the subversion of their institutions by a power vastly more dangerous to liberty than that of Cæsar or of Cromwell, because it is more insidious and least undersood, and more relentless in its grasp upon the people; because it is unrestrained by either the law or the press. Corporate power is fast becoming the law; corporate power is fast becoming the press. * *

The Government of the United States is one ordained for the *'general welfare.'* It is not established for the building up of powerful private corporations to accomplish the destruction of the people of the United States. I confess that in this undertaking, and in all others, I wish to see the people of the United States go forward from achievement to achievement, from height to height, and from glory to glory."

The woman who distrusts man in the abstract, can always be taken in by man in the concrete.—*Brick.*

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute of Architects, meets second Friday of each month at 408 California street

Seth Babson, Pres. — Geo. W. Percy, Vice-Pres.
Oliver Everett, Sec. — John M. Curtis, Treas.

Technical Society of the Pacific Coast, meets first Friday of each month at Academy of Sciences Building.

C. E. Grunsky, Pres. — Geo. W. Dickie, Vice-Pres.
Otto Von Geldern, Sec. — W. C. Ralston, Treas.

California Electrical Society, meets the first and third Monday evenings of each month at the Academy of Sciences Building.

Geo. P. Low, Pres. — C. O. Poole, Vice-Pres.
Max Caspari, Sec. — H. T. Bestor, Treas.

SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

THE regular monthly meeting of the San Francisco Chapter of the American Institute of Architects was held on March 9th, President Babson in the Chair.

Mr. Reid reported progress in the matter of housing the

COTTAGE AT ROSS VALLEY, J. CATHER NEWSOM, ARCHITECT.

chapter library, binding periodicals, etc. No action was taken in the matter of the appointment of an inspector of electrical work, the subject being postponed to a future meeting.

Mr. Edgar Marx Lazarus, architect, of the firm of Ellicott & Lazarus, Portland, Oregon, was elected a fellow member of the Chapter.

The committee appointed at the previous meeting to draft a resolution in regard to the method of designing Federal Buildings presented the following, which was adopted as an expression of the views of the Chapter:

The San Francisco Chapter of the American Institute of Architects, having had its attention called to the letter of January 9, 1894, from the officers and directors of the American Institute of Architects to the Honorable Secretary of the Treasury, in reference to the designing of public buildings erected under the supervision of the Treasury Department, desires to endorse the protest contained in the above mentioned letter in so far as it applies to the erection of public buildings in general. The case in point simply serves as an example and nearly all the past offices and custom house buildings in the United States add to the weight of their ill designed appearance to the feeling of protest that is steadily growing among Architects and people of

taste generally to the fact that our public buildings are a standing reflection on the architectural ability of American Architects.

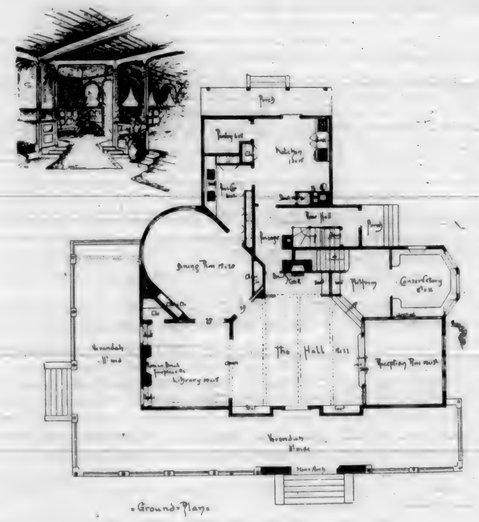
The San Francisco Chapter of the American Institute of Architects in meeting assembled, respectfully urge the Honorable Secretary of the Treasury to consider the following suggestions:

First—That whereas the employment of a supervising architect of the Treasury Department is totally inadequate to the proper designing of so many buildings of the importance that he is called upon to build, and that

Whereas—The concentration of so much work in the hands of an individual is detrimental to the highest excellence in architectural design, that this Chapter adds its voice to that of the Chapters in recommending a change from the existing practice

And whereas according to a law recently enacted the Secretary of the Treasury has the power to call for competitive designs, that this Chapter recommends that all designing for Public Buildings should be adopted in accordance with the terms of said law, and the Competitive Code of the American Institute of Architects, subject to the approval of the Secretary of the Treasury, upon the recommendation of a committee of professional experts, consisting of architects of eminent standing in their pofession, to be appointed for that purpose by the Treasury Department.

Messrs. Polk, Reid and Sanders were appointed a committee to consider the advisability of holding an annual exhibition of drawings, the offering of prizes to students, etc.

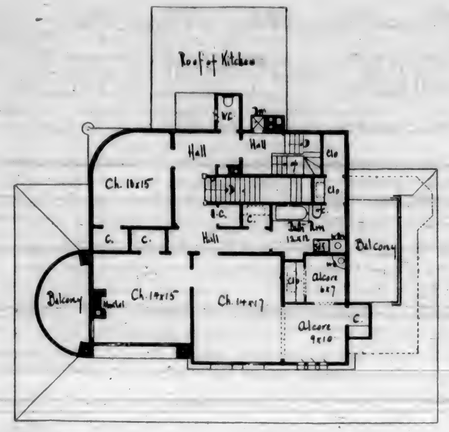


Ground Plans

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

Cancellation of Deed for Fraud.—A contract for the sale of a certain building and lot contained a covenant that the westerly wall was an independent wall, an attorney employed by both parties drew the deed, omitting any reference to such wall. He also attended to recording it. One of the purchasers, who transacted the business, could not read, and relied on the seller's representations concerning such wall, and on the attorney to correctly draw



the deed. The seller knew that it was not an independent wall. Some time after taking possession the purchasers discovered the fact, tendered a reconveyance, and demanded a return of the purchase money. A judgment setting aside the conveyance and directing a repayment of the purchase money was proper.

Keller vs. Feldman, Supreme Court of N. Y. 24 N. Y. Supp. 179 120.

When Materials not Used are not Subject to Mechanic's Lien.—Subcontractors who furnish materials specially designed and made for a building, and necessary for its completion, are not entitled to a lien therefore where such materials were not used because the contractor suspended work or for other reason.

Mechanic's Mill & Lumber Co. v. Deeny Hotel Co. of Seattle, Supreme Court of Washington, 34 Pac. Rep. 774. 48.

Right to Remove Party Wall.—A joint owner in a division wall may remove it, and erect a new one, if the work is done in a reasonable time, and the co-owner is reimbursed for necessary expense in protecting his property during the change.

Putzell v. Drovers' & Mechanics' Nat. Bank, Court of Appeals of Maryland, 28 At. Rep. 276. 44.

Action to Recover for Bill of Lumber.—In an action for the price of lumber furnished for the construction of a house, where the issue is whether the lumber was furnished to the owner or to his contractor, it is not a reversible error to exclude evidence to the effect that the contractor carried away the pieces of lumber not used in the house. It having been shown that the contractor gave the lumber dealer an order on the owner for the amount due for the lumber, it is proper to allow him to show by parcel that the order was given for the lumber charged to the owner.

Hartshorn v. Burne, Supreme Court of Illinois, 35 N. E. Rep. 622. 107.

Material Lien Must Take Notice of Title to Property.—The mechanic's lien law requires that a contract for materials, labor, etc., for the improvement of real property shall be made with the owner thereof, or his agent. A tenant, as such, has no power to contract for labor or materials so as to affect with a mechanic's lien the real property leased to him. A person furnishing material for an improvement must take notice of the interest and title of the premises of the person with whom he contracted as shown by the public record, as his lien for labor and materials, aside from the improvement itself, attaches only to such interest.

Waterman v. Stout, Supreme Court of Neb. 56 N. W. Rep. 987. 105.

Liquidated Damages for Delay on Contract.—Under contract for the construction of a house, to be completed at a certain time, providing that the contractor shall forfeit ten dollars per day thereafter until completed, the presumption is that such sum is intended as liquidated damages; and the contractor, contending that it is a penalty, has the burden of proof.

De Graff, Vrieling & Co. v. Wickham, Supreme Court of Iowa, 57 N. W. Rep. 420. 59.

Effect of Building Restrictions as to Subsequent Grantees.—A contract between the owners of property that no building shall be erected within a certain distance from the streets may be made by parol, and grantees of the land, who take with notice of the extent and nature of the restriction, are bound by it.

Hayward Homestead Tract Ass'n. v. Miller, Supreme Court, Special Term, Monroe County, 26 N. Y. Supp. 1091. 54.

BOOKS AND PERIODICALS.

We have received from Mr. Guy Kirkham, Springfield, Mass., a copy of a little volumne called THE BEST SECURITY. This little work is well worth the careful study of both the architect and those about to build. It may be called a succession of hints or suggestions, by giving some of the subjects treated of a good idea of the scope of the work may be obtained, "Convenience and Beauty, not a Matter of Cost," "Oneness of Exterior and Interior," "Plotting the Plan," Living Room and Dining Room" and so on to the end, the authors remarks are full of good sense, expressed in a modest manly way.

INDUSTRY.—Devoted to science, engineering and mechanic arts. The March number comes to hand full of articles of interest, among others "The Red Point Drift Gravel Mine" with a detail of the cost of various portions of the work that cannot fail to be of great interest to mining men, and also give the general public an idea of how small a quantity of gold per ton will pay for extracting, under favorable circumstances, combined with economical and prudent management.

We have not the space required to call attention to the other articles of interest, but would advise persons interested to get the journal and examine its merits at leisure.

THE HISTORY OF A LEAD PENCIL, by Walton Day, price ten cents, published by the Joseph Dixon Crucible Co., Jersey City, N. J. This little volume if carefully read will convince the general reader that it contains more information about pencils and how they are made, why some are bad, and some good, than they would have thought it possible for any one to know.

LIPPINCOTT'S MONTHLY MAGAZINE for March, contains for its complete novel "A Desert Claim" and certainly a charming story. The description of the cowboy and the cows are certainly very life like, ending in a pretty love story or more properly speaking commencing with a love story. The table of contents is unusually good and will well repay a careful reading.

SMITHSONIAN INSTITUTION.—We have received the Annual Report of the Board of Regents of the Smithsonian Institution. As usual it contains a vast amount of interest to collaborators and correspondents of the institution, teachers and others engaged in the promotion of knowledge; among others, an article on the Scientific Work of George Ohm being an address delivered at the public meeting of the Royal Bavarian Academy of Science of Munich, March 28th, 1889, it is well worthy the careful study of the electrical student.

The account of the Corbin Game Park by John R. Spears, although already published, cannot fail to be of great interest to the hunter as well as the general public. When we find a private gentleman investing not less than $400,000 in park of 22,000 acres and a collection of animals that without some such protection would in a few years become extinct—deer, buffalo, the elk and antelope, appear to have been Mr. Corbin's particular pets, though moose and reindeer have not been neglected. Our space will not allow of more than calling attention to this interesting report of Mr. Corbin's efforts in this line.

It is hard where so many matters are presented to our attention, to say which is the most interesting; undoubtedly this was the founder intention when he planned this noble institution for the spread of knowledge, that every class in search of information should come to the fountain head and find something in his line.

THE CALIFORNIA SCHOOL OF MECHANICAL ARTS.

WE are pleased to note in the daily press, that "The California School of Mechanical Arts," has at last a fair chance of becoming a reality.

James Lick, in his will, made provision for establishing and conducting this school; and the Trustees of his bequest are now, after many years of litigation, in a position to carry out the philanthropic motive of the millionaire.

The following clipping from the *Examiner* of March 10th, will be interesting reading, for those who will reap the benefit of Mr. Lick's intentions.

The trustees of the Lick bequest for "The California School of Mechanical Arts" met yesterday and decided to go to work at once on the erection of suitable buildings at the Potrero. The Chairman, Horace Davis, was authorized to take an architect to the site of the school at the Potrero and bring in a rough draft of plans at the next meeting. It is expected to complete the buildings within six months.

Mr. Davis was interviewed yesterday on the status of their funds and the feasibility of forming a union with the recent Wilmerding bequest for an industrial school.

"We have been tied up," said Mr. Davis, 'by the courts for years and years and we are now for the first time free so that we can use the $540,000 bequeathed for the school.

"This is not enough for us to do what we would like to, and the Court has most absurdly, to my mind, maintained that the revenues derived from these funds cannot be used by us until the building is erected and the school founded.

"This leaves but one thing to do. We have a block 200x400 feet in the Potrero. We must now erect a building. We would like to put up a handsome edifice as a monument to James Lick, but this cannot be or the school itself will have to suffer. Our building must be of the simplest, plainest kind and on a very moderate scale.

"We have $540,000. Allowing $140,000 for buildings, we have $400,000, which at five per cent yields $20,000. We must lay aside several thousand per year for a reserve or an emergency sum, and insurance, taxes, repairs and incidentals will bring down our annual revenue to $15,000.

"What can be done with that sum in running a great school? We have been anxiously waiting and hoping that some one would give us a building. Cogswell offered us his building at a most moderate rental, and had the courts allowed us the revenues to which we believe we are justly entitled, we would begin the 'California School of Industrial Arts, there immediately.

"It would indeed be a fine thing if the Wilmerding bequest could be united with ours. Neither is large enough to produce the results which are so highly desirable. There may be some way in which this may be brought about within the law, but I do not now see how.

"We could hardly design in favor of the Regents, even if we so desired. Again, the two funds might be worked with the greatest harmony by the two boards of trustees, each supplementing the other. The difficulty is that this harmonious relationship could not be guaranteed for all time.

"There is some difference, I think, in the two trusts, so far as I can interpret them as to the particular kinds of schools. The Wilmerding School of Industrial Arts is to teach boys trades, fitting them to make a living with their hands, with little study and plenty of work. On the other hand, the Lick bequest reads as follows: 'To found and endow at a cost of $540,000 an institution to be called 'The California School of Mechanical Arts,' the object and purpose of which shall be to educate males and females in the practical arts of life, such as working in wood, iron and stone, or any of the metals, and in whatever industry intelligent mechanical skill now is or can hereafter be applied, such institution to be open to all youths born in California.'

"I admit that Lick's bequest was made in the most bungling language, and although it plainly reads that only native Californians can attend the school, I believe he did not mean that.

"In other respects it is broader than the Wilmerding bequest. We could establish a technical manual training or trade school of any kind, but the board has unofficially decided on a manual training school after the type of the Cogswell Institute. We want to so train the hands of the boy that he can become either a journeyman artisan or a master mechanic in any particular vocation he may take up.

"However, I consider the differences in the trust to be of not so vital a character as to prevent consolidation, and if it can be done within the law it would be a desirable result."

A. S. Hallidie, another member of the Lick Trustees, said that he believed "the Lick school should not be of so high a grade as Cogswell's: that is, it should teach boys to be good journeymen and not master workmen. This is the kind of school that is needed now."

BUSINESS MOSAICS.

Browell's Patent Chimney's. These chimneys have not only the endorsement of the Board of Supervisors but are recommended for general use by the Fire Wardens, insurance agents and architects. Orders for Vitrified iron, stone sewer pipes, traps and connections, terra cotta chimney tops and flue linings filled at short notice by Mr. J. Browell, contractor and builder, 727 Montgomery St., San Francisco.

"When a man makes a large fortune, what do people say?" asked the teacher. "That he is fortunate," replied the bright boy. "That's right. Now when a man fails in business what do they say?" "That he didn't advertise.—*New York Recorder.*

Those about to build and who wish to avail themselves of sanitary appliances that will assure them fresh air with freedom of bad odors, cannot do better than consult Mr. Joseph Budde, the manufacturer of the popular Golden Gate Patent Water Closets. This well known establishment can surely fill your wants in the plumbing line—a visit to Mr. Budde's headquarters, 575 Mission street, will convince you that you have found the right place to have your wants in his line well supplied and all work furnished by him is first class.

"Who is that?" asked Brown, indicating McCork's typewriter and secretary. "That is my recording angel."—*West Shore.*

The San Francisco Lumber Co. are still on hand to supply lumber both wholesale and retail. This company under the able management of J. N. Curtis who will be found at the principal office of the company, NW. cor. Pine and Montgomery streets, have yards in various parts of the city as will be seen by reference to their advertisement in this paper. If the improvement in business continues as spring opens and building is once more commenced in old time style, they may expect a busy season for which they are well prepared.

San Francisco Novelty and Plating Works, also manufacturers of artistic metal works. This company gave a very good illustration of the advantage of keeping up with the times, as fashion changes in ladies dresses every spring and fall, bank decorations and show windows change for the better, season by season, and no more artistic work is found in the city than what is produced by this firm. With the latest improved methods for the deposit of gold, silver and nickel; their works are well worth a visit by the man of science to observe how the secrets of the laboratory are here carried out on a working scale, and for the working artisan to obtain an object lesson in the advantage of science as applied to the every day affairs of life.

Ferry—"Wrattle didn't speak to Bangs for twenty years until last week." Train—"How did he come to speak then." Ferry—"Bangs started to paint his house and Wrattel had to tell him how.—*Puck.*

If you want anything in the way of Parquetry Floors, Wood Carpet, fine Fretwork and Grills, go to Kenney & Wells, 422 Sutter street, San Francisco, or 1110 Broadway street, Oakland. While you are about it it would be a good idea to furnish one's pet room with mirrors, frames and pictures ordered from them and live to regret you had not furnished the rest of the house in the same way.

"How beautifully soft it is," he murmured laying his hand on her glorious white arm. "How less beautiful, but oh, so much softer," she tenderly replied, laying her jeweled hand on the top of his head.—*News Letter.*

Optical Exhibit of Dr. Robt. Thompson representing V. Vernard, Paris, to be found in the French Section, Manufactures Building, Midwinter Fair, is worth a call even if your eyes do not need attention,

Western Iron Works, 123 and 125 Beale street. This well known firm are still in the field for business in their line, contractors for wrought iron and steel building work; also beams, girders, anchors, stirrups, vaults, railings, etc. As the coming season bids fair to see the erection of some large buildings of the class requiring this kind of work, their works promise to have a busy time in the next few months.

He—"I have $3,000 a year. You could certainly live on that?" SHE—"Yes; but I should not like to see you starve.—*News Letter.*

The Lord knew what was best for man's peace of mind when he failed to put eyes in the back of his head.—*Atchison Globe.*

George Goodman—Patentee and manufacturer of Artificial Stone, has this advantage, that whoever walks over their sidewalks becomes an advocate of the extension of such walks. He hardly needs to have a notice calling attention to his advertisement as those that walk can read under their feet "Schillinger's Patent," and this when constructed under the skillful eye of Mr. Goodman is a sufficient warrnat that speaks for itself.

CITY BUILDING NEWS.

Capp near 23d. Grading, brick, carpentering and plastering work; owner, M. A. Warren; contractor, Richard Searls; signed, March 3; filed, March 3; $2,900.

Castro and 17th. Two-story frame; owner, H. Hetherington; architect, H. D. Mitchell; contractor, L. N. Fletcher; signed, March 7; filed, March 7; cost $3815.

Clay near Baker. To build; owner, F. M. Stevens; contractors, White Bros.; signed, March 2; filed, March 5; cost $6275.

City Hall, lot 48. Alterations and additions; owner, California Title and Trust Co.; contractors, Jas. and J. A. McDonald; signed, March 3; filed, March 6; cost $5,941.

Douglass near Alvarado. To build; owner, John A. Keogh; architect, T. J. Welsh; contractor, John P. Dunn; signed, Feb. 27; filed, March 8; cost $1417.

Ellis and Larkin. Alterations and additions; owner, Edward Connolly; architects, Shea & Shea; contractor, James Cochran; signed, Feb. 9; filed, Feb. 14; cost $4400.

Ellis and Larkin. Painting; owner, Ed. Connolly; architects, Shea & Shea; contractor, Jas. Rainfeld; cost $567.

Ellis and Larkin. Plumbing; owner, Ed. Connolly; architects, Shea & Shea; contractor, John P. Culley; cost $800.

Ellis and Mason. Stair work; owner, Y. M. C. A.; architect, A. Page Brown; contractors, Mahoney Bros.; signed, Feb. 13; filed, Feb. 15; cost $3,500.

Eleventh Ave. near J. To build; owner, Emil F. Tahler; contractor, Casper Zwierlein; signed, Feb. 20; filed, March 5; cost $1000.

Fell near Masonic Ave. To build; owner, Edward May; architect, Julius E. Krafft; contractors, Wm. W. Ackerson and Wm. Peterson; signed, Feb. 12; filed, Feb. 14; cost $6114.

Fell bet. Broderick and Baker. A flat made out of a rough basement; owner, Herman Puckhaber; contractor, Peter Johnson; cost $1035.

Fillm re No. 206. Alterations; owner, Mrs. Louisa Hagmaier; contractor, G. G. Gillispie; signed, Feb. 16; filed, Feb. 20; cost $2575;

Folsom and 21st. To build; owner, Ed. Connolly; contractor, Henry P. Conrady; signed, Feb. 14; filed, Feb. 14; cost $6065.

Fulton near Devisadero. To build; owner, Mary A. Gaynor; architects, Shea & Shea; contractors, James E. Mooney; filed, March 5; signed, March 8; cost $3777.

Fillmore near Haight. Grading, brick and carpenter work, plastering, painting, graining, glass, etc.; two too story buildings; owner, John A. Sandell; architect Edward J. Vogel; contractor, Robert Currier; signed, Feb. 13; filed, filed, Feb. 14; cost $4950.

Fillmore near Haight. Plumbing, ga -fitting, etc.; owner, John A. Sandell; contractor, Newmark & Mills; signed, Feb. 12; filed, Feb. 14; cost $698.

Golden Gate Ave. near Lyon. Three-story frame; owner, John T. Hayes; cost $6000.

Harrison and 10th. To build; owner, Geo. I. Roychester; contractor, M. McCracken; signed, March 8; filed, March 8; cost $1900.

Hayes near Scott. To build; owner, Christian Jaun; contractor, Jacob Schuler; signed, March 5; filed, March 5; cost $3840.

Hayes bet. Lott and Lyon. To build; owner, W. H. Kinread; cost $4500.

Henry near Sanchez. To build; owner, Wm. Von Voss; contractors, Kenig Bros.; signed, Feb 12; filed, Feb. 13; cost $3895.

Howard near 23d. To build; owner, Adolph Schulze; architects, Kenitzer & Barth; contractor, Anderson Bros.; signed, March 11; filed, March 11; cost $6680.

Jackson and Gough. All cabinet work; owner, S. Swabacher; architects, Percy & Hamilton; contractors, Fink & Schindler; signed, Jan. 11; filed, Jan. 11; cost $2520.

Jackson near Laguna. To build; owners, Walter Speyer and wife; architect, B. McDougall & Son; contractor, J. H. McKay; signed, March 6; filed, March 6; cost $14,737.

Jackson and Scott. Stable building all work except concrete; owner, Wm. H. Talbot; contractor, Peter Chrichton; signed, March 7; filed, March 7; cost $7720.

Leavenworth near Eddy. Four frame buildings and basements; owner, Harriet McCarthy; architects, Shea & Shea; contractor, W. H. Leahy; filed, Feb. 24; cost $10,780.

McAllister near Jones. Passenger elevator with electric motor; owner, Katherine Adam and Eliza Kibbe; architect, Julius E. Krafft; contractors, A. J. Nicoll & Co.; signed, Feb. 12; filed, Feb, 16; $3100.

Page and Lyon. To build; owners, Rountree Bros.; architect, E. R. Swain; contractors, Rountree Bros.; cost $7000.

Post and Powell. Plumbing and sewering; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, R. A. Vance; signed, Feb. 15; filed, Feb. 20; cost $11,742.

Post and Powell. Sheet plate glass, etc., owner, Mrs. A. M. Parratt; architects, Pissis & Moore; contractors, F. N. Woods & Co.; filed, Feb. 24; cost $3975.

Post and Leavenworth. Electric light works; owners, S. S. Verein Assn.; architects, Salfield & Kohlberg; contractors, Edison Electric Light Co.; signed, Feb. 12; filed, March 1; cost $1710.

Post and Leavenworth. Marble work; owner, S. F. Verein Assn.; architects, Salfield & Kohlberg; contractors, Ruffino & Bianchi; signed, Feb. 12; filed, March 1; cost $2098.

Post and Montgomery Safe and vault work; owner, Union Trust Co.; contractors, Diebold Safe and Trust Co.; filed, Jan. 2; cost $29,067.

Sanchez near 18th. To build; owners, Emery and Minnie La Valle; contractor, Thos Elam; cost $3780.

Scott and Green. Two too-story buildings; owner, E. Avery McCarthy; contractor, Louis Landler; architect, J. C. Newsom; filed, March 5; cost $13,250.

Sixth near Point Lobos Ave. To build; owner, Felix M. Hugh; contractor, Bernard Duffy; signed, March 9; filed, March 10; cost $4600.

Sutter and Mason. Stair work on Bohemain Club; owner, S. Wenban; architects, Pissis & Moore; contractor, H. W. Frick & O. A. Crasmer; signed, Feb. 14; filed, Feb. 15; cost $5174.

Sutter and Mason. Plastering; owner, S. Wenban; architect, Pissis & Moore; contractor, C. Dunlap; signed, Feb. 7; filed, Feb. 15; cost $8247.

Taylor near Filbert. Two too-story and basement; owner, Ida M. Stringer; architect, Chas R. Wilson; contractor, Timothy Sullivan; signed, Feb. 10; filed, Feb. 14; cost $4170.

Twelfth Ave. near H. To build; owner, Jos. Morrisey; architect, W. H. Lillie; contractor, T. T. Pottinger; signed, Feb. 26; filed, Feb. 27; cost $1627.

Thirty-first Ave. near Point Lobos Ave.; To grade; owner, W. R. P. Adamson; contractors, W. N. Stanley & E. F. Dennison; signed, Aug. 20; filed, March 6.

Twenty-third near Sanchez. To building; owner, Edward Brugge; architect, Robert Frost; contractors, R. Erost & Fred Antree; cost $2,150.

University Mound, block 37. To build; owner, J. and G. Giannini; contractor, Wm. I. B. Warner; filed, March 9; cost $1650.

Van Ness and Myrtle Ave. Steam heating; owner, Dr. C. F. Buckley; architect, M. J. Lyon; contractors, Ford Bros.; signed, Feb. 24; filed, March 16; cost $2000.

Waller and Frederick. To build; owner, J. N. Riedout; architects, Townsend & Wyneken; contractor, Thomas Ridout; signed, Feb. 21; filed, Feb. 24; cost $8400.

THE HONORABLE SECRETARY OF THE TREASURY who apparently knows more law than the lawyers, more finance than the financiers and more architecture than the architects, probably knows more of the creation than the Creator; for he has wisely and properly squelched Daniel H. Burnham who had the temerity to suggest that the American Institute of Architects, a National Organization, was entirely disinterested in its efforts to correct the errors that mark the designing of our public buildings. Mr. Burnham, to whom belongs the proud distinction of having directed the construction of the most harmonious and beautiful group of buildings ever erected in the history of the world, with the natural egotism begot of great success, had the presumption to think that his personal opinion, expressed in approval of the joint wisdom of the American Architects, would add weight to that of the Institute in bringing influence to bear on the high authority vested in the Treasury Department of our great Democratic Government. Mr. Burnham was mistaken and the advancement of Architecture has been checked. But we need not despair, for the natural destiny of a great country is excellence in the Fine Arts.

The marvelous development attending the building of the Chicago Fair buildings is too strong an evidence of the healthy growth that the architecture of this country is experiencing, and the protests that are being entered against the designs of our public buildings are but a small intimation of more that will follow unless there is a revolution in the methods of the Treasury Departments which intrusts the designing of so many important buildings to an official whose salary is equalled by the remuneration received by the assistants to architects of but modern practice.

Perhaps Mr. Carlisle has been too busy to properly interpret the designs of the times, but this is a subject that will refuse to be ignored, and is one calculated to command the most distinguished consideration, if not from Mr. Carlisle perhaps from his successor.

UNTIL this recent affair with the American Institute of Architects, *Life* had supposed Secretary Carlisle to be a reasonably patriotic person. There are few intelligent boys in this country over seven years of age who would have had the courage to come out so fearlessly for what all the rest of the world knows to be the wrong thing.

Educated architects are not looking to this gentleman from Kentucky for professional instruction. If his skin is so thin and his sense of his own dignity so lofty that it unfits him for the purposes for which he is drawing a salary, he would do well to borrow an elastic hat and return to the blue pastures of his own State for a period of reflection.

Mr. Carlisle's ideas of his own dignity are of far less importance to the people of this country than the services the American Institute of Architects can render our national architecture.—*Life.*

[Our bright little cotemporary *Life* is edited by a gentleman of considerable architectural taste and its comments quoted above are calculated to command the respect of even so mighty an authority as the Secretary of the Treasury.—EDITOR CALIFORNIA ARCHITECT AND BUILDING NEWS.]

THE FIRST ANNUAL EXHIBITION OF THE SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

N the eastern cities Architectural Exhibitions having so long been regular events it is gratifiying to note a beginning in that direction in San Francisco.

The Chapter of Architects deserves much credit for inaugurating the scheme, and to the Art Association is due the thanks of the profession for its kindness in putting its magnificent room at the disposal of the Chapter.

A visitor to the spring exhibition of the Art Association at the Hopkins Institute of Art cannot fail to be interested in the collection of architectural drawings and designs.

Numbers 1, 2 and 3 in the catalogue are the elevations and sections of the Hopkins House. These drawings made sixteen years ago should be of considerable interest to draftsmen of to-day. They are excellent examples of carefully rendered wash drawings, besides being illustrations on paper, the work of Wright & Sanders, the architects of the building in which the drawings hang.

Number 10 is a pen and ink drawing of the Hibernia Bank by D. A. Gregg. This drawing will command the attention of all draftsmen as much as the building has compelled the admiration of all architects. Messrs. Pissis & Moore have been congratulated so often on this building that any praise would be an old story and any criticism would be out of place.

Moretti's water color drawing, number 11, of Pissis & Moore's Bohemian Club building is not as good a drawing as Moretti generally does. It is anything but clear in color, being heavy and cloudy and reflecting but little credit on

RESIDENCE OF V. J. A. REY, POLK & POLK, ARCHITECTS.

BULINGAME COUNTY CLUB STABLES, A. PAGE BROWN, ARCHITECT.

the building it represents. This building which is now nearly finished is an ornament to the city and another one of which its architects should be proud.

Number 13 is an excellent water color drawing by Ernest Coxhead of his St. John's Church, humorously dubbed "St. Roofus" by the clergy on account of the enormity of its roof. The drawing however is as good an example of an architectural water color as there is in the exhibition.

Number 14 is a pretty little pen and ink, by R. M. Turner, of a Chapel at Coronado by Reid Bros. This is the only contribution that Reid Bros. have made to the collection.

A matter to be regretted and which it is hoped they will remedy before the exhibition closes.

Number 18 the catalogue says is the Union Trust building by Clinton Day, but a careful search of the rooms fails to reveal the drawing. Possibly Mr. Day intends to repair this omission.

Numbers 19 to 26 are a series of clever drawings of work by A. Page Brown.

HOTEL NEAR MONTALVO, CALIFORNIA, A. C. SCHWEINFOURTH, ARCHITECT.

Number 29 is a stunning pen and ink drawing by Ernest Peixotto of a design by Willis Polk for a Market street building.

Perhaps the best pen and ink sketch in the show is of the Palace Contarini, No. 9, by Dan Polk.

EPISCOPAL CHAPEL, CORONADA BEACH, REID BROS., ARCHITECTS.

Messrs. Mathisen & Howard have a large series of attractive sketches that are well worth careful inspection. It is hard to say which of these gentlemen do the most interesting work.

BURLINGAME RAILWAY STATION, MATHISEN & HOWARD, ARCHITECTS.

Coxhead & Coxhead have four or five charming pencil sketches. They should have sent more.

Three drawings by Anderson of some work of Ellicott & Lazarus of Portland, Oregon, are examples of Anderson's well known coloring with which local drawings will compare favorably.

Of decided interest are six little sketches, numbers 63, 64, 65, 66 and 68 by W. M. Ellicott of Portland, number 65 an Interior of St. Mark's Church, Philadelphia, is splendidly done is sepia.

Number 54, The Hobart Mausoleum, by Percy & Hamilton is an excellent design with the drawing rendered in good style.

Number 74, A Winter Residence at Santa Barbara by A. C. Schweinfourth is a splendid water color of a most interesting design. This is in line with a style of architecture

RESIDENCE OF GEORGE WHITTELL, COXHEAD & COXHEAD, ARCHITECTS.

MONTGOMERY MEMORIAL CHAPEL, WRIGHT & SANDERS, ARCHITECTS.

thoroughly characteristic of California and something of which we should see more.

Number 67, the residence at Belvedere of V. J. A. Rey, by Polk & Polk, is in line with it and illustrates the adaptability of the style to a very difficult site.

A BIT OF VENICE, FROM A SKETCH BY DAN POLK.

Among the photographs the residence of O. D. Baldwin, number 98, by Samuel Newsom, is a pleasing variation of the architect's usual style.

Number 100 is Mr. Oothout's residence at Fresno, by A. Page Brown.

COLOR IN BRICK AND TERRA-COTTA.

THE matter of color in brick and terra-cotta is now so well in control that an architect willing to give a little attention to experimental work can count upon getting from any one of the large manufacturers exactly what he wants. It is often the case that he selects one or the other from some sample at hand, and requires a match in the material which he has not selected by sample. When an architect makes such a selection he should try to get the kind of brick he wants, and let the terra-cotta manufacturer do the matching. The principal reason for this is that in brickmaking clay must be mixed to produce the desired color when burned, while in a piece of terra-cotta the exact color can be obtained by "slipping." The slip is a coating applied by a machine on the principle of the atomizer. A creamy paste of the slip clay is mixed and placed in a receptacle, through the top of which projects a tub running down into the paste. Across the open top of this tube a jet of steam is forced, which draws out the paste and sprays it over the piece of green terra-cotta. When this is done the terra-cotta has a secure coating of the kind of clay necessary to give the right color when burned. This process renders it comparatively easy for the terra-cotta manufacturers to produce the exact shade desired by the architect, so that if it comes to a question of matching one with the other, as is now being done to a greater extent than formerly, let it be the brick that is first selected.—*The Brickbuilder.*

CORRESPONDENCE

To the Editor of The California Architect and Building News:

In a recent issue of one of our local building papers and copied by an eastern cotemporary, has appeared a severe article deprecating the construction of Portland Cement Walls for foundations and basement walls of buildings, so much in practice at the present time, as being unreliable, due to gradual waste, and also wanting as a fire-proof construction; which is so at variance with those of experience in application, and the numerous authorities who have given it long and patient scientific study and investigation, that it seems novel at this late day. If such is the writers experience, it must have beeen due either to the use of comparatively valuless quick setting cheap Portland cements of which the market is flooded and manipulated in the hands of workmen heedless as to the requirement to be worked quickly; this probably alone, or together with improverishment due to the small quantity of Portland cement compared to the other ingredients to cheapen the mixture, in the hands of unreliable contractors has most likely been the writer's experience and has soured him on Portland cement concrete.

In support of this statement I revert to the introductory notes on concrete and works of concrete, by John Newman, which is one of our valuable standard works on Portland cement concrete, which reads as follows:

"Portland Cement Concrete has become one of the most important materials in construction, and can be used with absolute confidence that the work will be of a hardness and strength, and will not deteriorate, provided the necessary care is taken in selection, proportions, mixing and deposition, which long and varied experience has proved to be indispensibly requisite.

"By judicious application, many works can now be erected, more especially submerged structures, that by reason of their great cost, it was impossible to construct, but now Portland cement walls of average thickness for engineering purposes, can be built for one-half, or one-third the expense of masonry or brick work.

"The valuableness of Portland cement, is its power of firmly uniting other substances, its cohesiveness, durability, and adapability to be moulded into any form with a rapidity of execution unattainable with brickwork and masonry.

"Apart from the cement, the nature of the other ingredients is of great importance, the mode of mixing, depositing, etc., for practical value of cement may be destroyed without due attention to tliese details."

As Mr. Newman says, which is known to every practical experienced worker in Portland cement, that its practical value may be destroyed without due attention to the mode of mixing and depositing.

Suffice to say, Portland cement and its concretes, has not only held its own, but advanced in usefulness, and far outstripped other cementing materials, that it stands head and foremost, and ranks as one of the great inventions, deserving rank with applied electricity; and it seems to me to berate its effectiveness rather belittles he who does attempt it.

As to the fire-proof or fire resisting qualities I would refer to the following, taken from Thaddeus Hyatt's valuable work, entitled "Portland Cement Concrete Combined with Iron as a Building Material." This work may be found in many of our public libraries.

ADAPTABILITY OF PORTLAND CEMENT CONCRETE AND IMBEDDED IRON OR STEEL TO FIRE-PROOF CONSTRUCTION.

"To ascertain the limits of expansion and contraction of Portland cement within definite ranges of temperature, trial sticks of cement were made and heated, the expansion of the same being ascertained by placing the tests between two fixed points, space being allowed between the variations in which were ascertained by means of tapered pieces, which were then measured by Holtzapffel's thousand gauge. The result was found to be a lineal expansion of .00137 for 180 degrees of heat as compared with .00140 for wrought iron, a result so near that the expansion may be considered the same; but in order to prove the result practically; blocks of cement concrete, fourteen inches long and four inches deep by three inches wide were made, in which bars of iron were imbedded, the bars varying in size 2x1-32 of an inch to 2x2 inches and 12 inches long.

"*On testing these by fire no difference in effect was found to be produced on the concrete by the different masses of metal contained within them.*

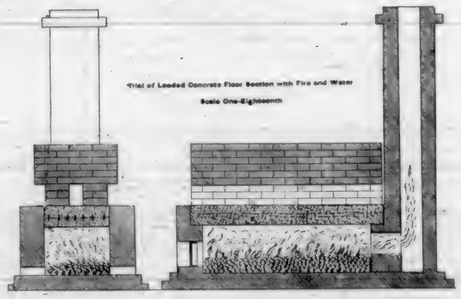
"As a final test, bars of iron two feet long by one-half inch thick were imbedded in blocks of concrete; these blocks on being exposed to the red heat of a furnace for six hours, were found to be entirely sound and good when taken out; the synchronism existing between the expansion of the two materials, whatever the size of the metal, was thus placed beyond question, and in respect to this combining concrete with iron for building purposes the *two materials may be regarded as practically homogeneous.*

"These results as may be supposed, were in the highest degree satisfactory and assuring.

"*In order to test the effect of fire and water to a real floor of the concrete construction, combined with iron*, a section of one sufficiently large to leave no doubt as to the result of fire and water to a real floor in actual use. Accordingly a furnace was built as represented in the following plate, the top being a slab or floor section six feet long by two feet wide, and seven and one half inches thick.

"The tie-metal in gridiron form was placed at the middle of the thickness, three inches of concrete being above and three inches below the metal.

"The furnace was made with a range of air holes on either side, to insure perfect combustion and intense heat.



"Loose bricks were piled upon the furnace top until a load was obtained of 300 pounds per square foot over the whole surface, the deflection being with this load 1-32 of an inch in a span of five feet.

"The fuel was arranged to form an incandescent bed six inches at twelve inches below the under face of the concrete slab.

"The fire was kindled at six o'clock in the morning, had by eleven become an intense heat perfectly uniform over the entire surface, and the bottom of the concret was also at a glowing red heat all over.

"At this intensity the fire was kept up until 4 P. M., a period of ten hours from the lighting of it. During this time the slab had deflected three-eights of an inch.

"A stream of cold water was now thrown forcibly against

the bottom of the slab for a period of fifteen or twenty minutes, by means of a garden force pump, and the load then removed.

"On examining the underside of the section it was found uninjured; and the next morning, being then entirely cold, the deflection had disappeared—*the slab had returned to its former level.*

"In order to confirm these results a second trial was made. This time the load was left upon the slab, which, during the firing, deflected as before, *but upon cooling returned to its original level, lifting the load with it.* In proof of the heat of the furnace it may be mentioned that in the course of this experiment the faces of all the side bricks in actual contact with the fire were melted."

In addition to the experiments described others of less moment were made, as to the non-conducting power of various substances, such as plaster of Paris of different densities, and concretes more or less porous, also air spaces; the result of all being that the best material to protect the metal against heat was found to be that which was the strongest in compression, viz: Portland cement concrete of best quality, no advantage for any purpose being found from fibres of any kind, not even *asbestos.*

Mr. Hyatt is the inventor of effectively combining Portland cement concrete with iron or steel as a building material in a way that supporting iron or steel beams are no longer required for support of fire-proof floors, side-walks and the like, saving two-thirds their cost. CONSISTENCY.

THE OWNERSHIP OF DRAWINGS MADE FOR AND BY AN ARCHITECT.

[*Continued from March Number.*]

AN architect is paid for his services either by salary, by fee, by commission, or by time. The term "salary" applies to all payment (generally as an annual one) for continuous professional services necessary to the satisfactory discharge of the duties of the position held by the salaried architect, whether such services be rendered daily or only occasionally, and whether the hours of work be fixed or left to his discretion. There may still occur a case in which an amateur gives to an architect just free from pupilage a moderate salary to look after an estate generally, and to assist in improving it and the mansion. In such a case, all finished drawings absolutely belong to the employer, whoever provided the materials, but they pass to the architect by verbal or written consent, being, in fact, a part of the patronage which supplies him with a portfolio of (not academical) drawings of work that has been, or has been likely to be, executed. All unfinished (in rough) works, such as dimensions in a note-book, measuring-book, or field-book, with calculations therefrom and abstracts thereof, belong to the salaried architect; he has always had it in his power to throw them aside (replacing, if necessary, the material) if he suspected them, and so preferred to take reproach of indolence rather than of carelessness, ignorance or incapacity.

There is, next, the case of the amateur who takes into residence, or pays by salary, or both, a clever, but yet unsuccessful, architect to draw out what the amateur designs, or thinks he designs, or wishes to see designed or drawn. The patron will (perhaps jealously, certainly legally) insist upon securing every scrap of paper used by the architect in setting forth an idea, and every alteration suggested until the completion of the finished drawings, even if these run into complicated details at full size, or highly-finished pespective views. This patron naturally holds that it is not honorable in his salaried architect to make tracings of the finished drawings, either in or out of office hours. This arrangement is sure to fail unless an office room and fixed hours are part of the bargain.

The last phase of salaried business to which attention need be given here is that of the architect attached to a public building or institution. If he acts as steward, which in some places is part of the business, his ledgers belong to the office; and if his work includes building, his contracts and bills examined, or ready for examination, belong to the office. But at the death or departure of the architect, all all rough work excepted in the positions above mentioned, ought not to be asked for by the client, who should be satisfied to think himself fortunate in getting any finished drawings made in explanation of the contract drawings for new works in progress. As to designs for new works proposed, the successor should prepare his own design for his own work, and not lazily avail himself of the labor (which he may misunderstand) of his predecessor, who, if alive, is not to be damaged in reputation by having his work spoilt, or if it be unsuccessfully executed, to be made responsible for the liabilities that may occur.

When an architect takes a salary for the guardianship of a building, the drawings which he may make of defects in the existing structures, for the purpose of pointing out them and the remedies ought to remain in the office for his successors. But all drawings made outside the usual hours of work where daily service is required, or even (by open or tacit agreement for an equivalent) during those hours, or in the intervals of occasional service, for any object apparently connected with the salaried situation, but really foreign thereto, belong entirely to the architect until he parts with them for a fee or other consideration.

The term "fee" applies to payment for a report, whatever be the nature of the document, and whether illustrated or not by drawings. The property in finished work done for a fee is generally supposed to pass so entirely to the client when he excepts the work as to prevent publication by the reporter without the consent of the client, while any attempt on the part of the reporter to prevent publication by the client would be reprobated by his professional brethren. The plan, as of an estate, made by a surveyor is, in fact, a report of the shape, extent and nature of the estate, and the drawing is itself his report; but all wrongly-plotted plans or rough draughts belong to the surveyor, and would not be yielded to the client by any man of respectable position in business. If they were demanded by a troublesome client, the surveyor would probably destroy them, and communicate the fact of their non-existence as his reply to the demand. So, also, if an architect is required to report on the condition of a building, or part of a building, his rough draught of his report might be demanded by a troublesome client; and, inasmuch as the architect's first impressions might have been modified by subsequent surveys, the destruction of the rough draughts of reports would be prudential. Indeed, destruction seems to be the only way by which to promptly meet a demand for papers upon which statements apparently incriminating the architect or surveyor might be founded. It is for the *finished work*, not for the preliminary studies, that the amount of the fee is fixed; otherwise the architect or surveyor might tender the rough work, or studies, and require in exchange the fee; and the order of the client to stop and deliver the unfinished work on part payment of the proposed fee would be as futile in an action against him for the entire profit of the transaction as if he refused to accept the finished work without the rough work.

Continued in our next.

BOOKS AND PERIODICALS.

THE PHOTOGRAPHIC TIMES for April 6th contains an interesting account of an interview with Edison, and a description of his latest invention—the Kinetoscope. The article is illustrated by some photographic reproductions of pictures taken by the instrument. There is also an account of the life and work of Mr. H. P. Robinson, the renowned artist photographer, with some samples of his latest and finest productions recently exhibited at the London Photographic Salon. The rest of the magazine is made up of matter interesting to every photographer, amateur or professional.

LIPPINCOTT'S Monthly Magazine for April contains "The Flying Halcyon" a complete novel by Richard Henry Savage. The reader will find this an interesting story with a dash of California life, a little of Mexican adventures with plenty of chances and changes, and lots of people made happy by being married off in the end.

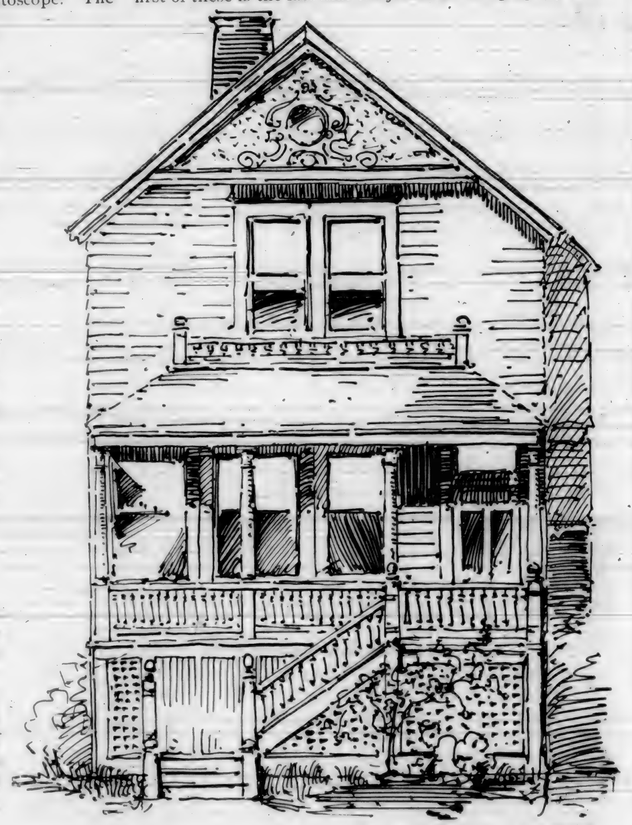
The Librarian among his books by Julian Hawthorne, will interest many that way inclined, while "Co-operative Housekeeping" by H. C. Walsh will come to every housekeeper as a new revelation.

YE SPANISH TILE. An illustrated leaflet by Merchant & Co., giving details of the advantage of Metal Tiles over Terra-Cotta Tiles.

GRAPHITE AS A LUBRICANT—Scientifically and practically considered—a small pamphlet of a very convincing nature. If you want a copy send to the Jos. Dixon Crucible Co., Jersey City, N. J., who will be pleased to forward you one free of charge.

TILE AND IRON HOUSE DRAINS.

THE *Morning Advertiser*, of Rochester, N. Y., is discussing the question of tile and iron house drains. We are sorry to see that the Board of Health of that city has rescinded their former action, which prescribed all horizontal drains within the house to be of extra heavy cast iron pipe. The tile house drain has certain serious disadvantages which there seems at present to be no way of overcoming. The first of these is the fact that the joints are not properly made by ordinary workmanship. The second is its extreme brittleness. A comparatively slight blow or small settling of the foundation of the house is sufficient to break a tile drain. A reasonable system of testing under a small pressure, might perhaps overcome the danger from imperfectly made joints, but it is doubtful whether there is any feasible way of securing safety against breakage. The almost universally bad condition in which old house drains are found is a pretty serious argument against the material. This is an unfortunate fact, because on account of its internal smoothness, freedom from corrosion, and general durability when of a proper quality, it has many points of superiority over any other material which can be used for the same purpose.—*The Sanitary Plumber.*



COTTAGE AT OAKLAND VIEW, W. JONES CUTHBERTSON, ARCHITECT.

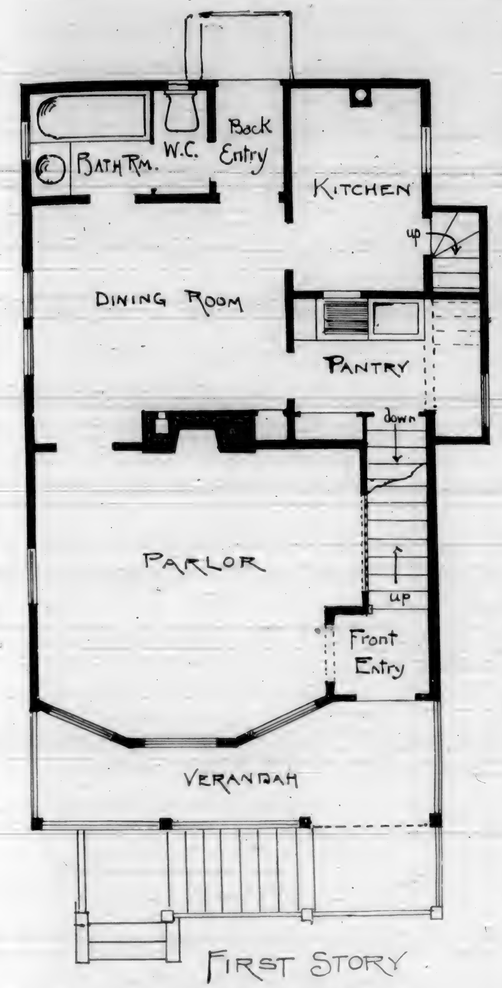
NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street.
SETH BABSON, Pres. GEO W. PERCY, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

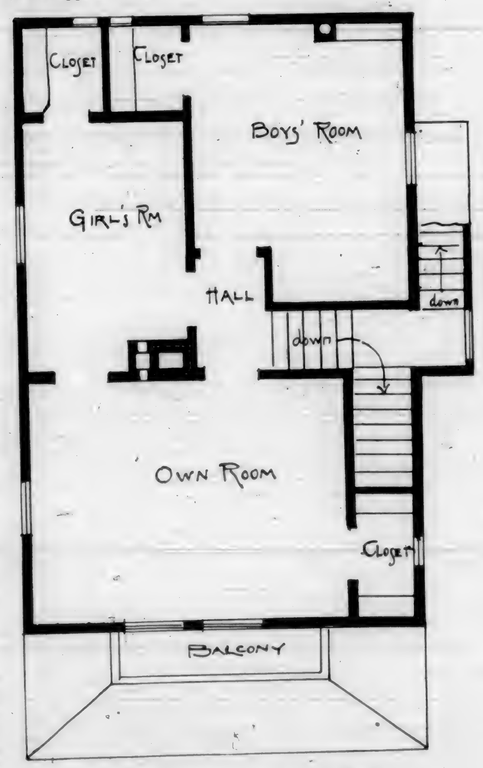
TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
C. E. GRUNSKY, Pres. GEO. W. DICKIE, Vice-Pres.
OTTO VON GELDERN, Sec. W. C. RALSTON, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

MRS. S.—"Well, here we are in another boarding house. We are regular Arabs." Mr. S.—"Yes; folding Bed-ouins!" —*Life.*



FIRST STORY



SECOND STORY

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

CERTIFICATE OF ARCHITECT ON BUILDING CONTRACT.—A building contract, which provides that final payment shall be made within thirty days after completion, "provided that * * the architect shall certify in writing that all the work * * has been done to his satisfaction," constitutes the architect the agent of the owner, and his decision as to completion of the work is final. A certificate under such contract sufficiently complies with the terms of the contract where it states that "there is now due to" the contractor "the final payment on his contract," specifying the amount.
Snaith v. Smith, Common Pleas of New York City and County, General Term, 27 N. Y. Supp. 379. 90.

INTERPRETATION OF BUILDING CONTRACTS.—Where one let a contract to another, to do the stone work on a building, providing for monthly payments, not to exceed eighty per cent of the estimated value of "the work performed on the building." The most expensive part of such work was quarrying and dressing the stone before it was put in the building. The contract intended that the payment should be based on the stone prepared for the building as well as that actually put in.
Smith v. Molleson, Supreme Court, General Term First Dep't, 26 N. Y. Supp. 653. 82.

NOTICE TO OWNER OF MECHANICS' LIENS.—Under the statutes requiring the owner of a building to retain sufficient funds to pay a claim for materials, furnished by a material man who has given notice of his claim to such owner, a material man who serves the required notice acquires a prior right to the fund in the hands of the owner, due the contractor, though the contractor subsequently abandons the contract.
Russ Lumber & Mill Co. v Roggenkamp, Supreme Court of California, 35 Pac. Rep. 643. 71.

ARBITRATION OF DISPUTES IN BUILDING CONTRACTS.—A building contract provided that the owner might at any time during the progress of the work "make any alteration, deviation, addition, or omission in the work hereby contracted for;" the value of which should be added to or deducted from the contract price, and that any dispute should be determined by arbitrators. The provision for arbitration did not apply where the owner refused to pay for the work on the ground that the contract had not been substantially performed.
Oberlies v. Bullinger, Supreme Court, General Term, Fifth Dep't. 27 N. Y. Supp. 19. 86.

RISKS ASSUMED BY SERVANT.—Where one was employed to shovel away from the bottom of a chute debris, consisting of bricks, etc., which the owner was removing from the upper story of a building, and, while so engaged, he was struck by a brick. The chute was in good condition, and was the usual appliance for the purpose for which it was used. The employe had observed the character of the debris coming down, and knew the danger. The injury resulted from a risk incident to the employment.
Fennessey v. Western Union Tele. Co., Superior Court of New York City, General Term, 26 N. Y. Supp. 796. 88.

WHAT CONSTITUTES ABANDONMENT OF CONTRACT.—Where a claimant who has released his lien on the agreement of the owner to pay the claim afterwards, reinstates his lien because of the refusal of the owner to make the payment, he hereby abandons the agreement with the owner, and can not afterwards sue on it.
Cassidy v. Aldhous, City Court of New York, General Term, 27 N. Y. Supp. 267. 52.

THE PRAIRIE SOD HOUSE.

"THE sod house of the Kansas and Nebraska plains is following the buffalo and antelope into the land of legends," said William F. Arbuckle of Topeka to a representative of the Washington *Post*. "A good many of the queer structures are still standing, and in some instances are yet used as human habitations, but most of them are utilized as stables for horses or cattle and are slowly crumbling away to become indistinguishable in their original earth. When I first went West, years ago, my father took up the acres as far as his eye could reach in what is now Eastern Nebraska. There was not a tree in sight of the knoll he had selected as the spot upon which his residence should be erected, and the nearest place lumber could be secured was sixty miles away. He put up a small tent in which to cook and eat—the family slept in the wagons—and, with my brothers and a hired man to help, set about making a house. The thick sod was cut from the prairie in slabs about two feet wide by three feet in length, and on the side of the knoll, where an excavation had been made in its side, these slabs were placed, one on top of the other, until the required height was reached. It was arduous work, and I remember what a lot of excitement there was when my father and my brother Lem started off early one morning to go after the ridge pole and rafters that were to support the roof. They took only the running gear of our small wagon and I cried like a good fellow when they started off because I thought they had broken up my pet vehicle. They were gone nearly a week and reached home in the middle of one night after their journey of 120 miles. They had brought a long, round piece of timber, like a slender telegraph pole, with numerous other small pieces, and my mother nearly had a fit of delight when they proudly displayed a door and two window sashes, with a bundle of glass for the latter. There was great rejoicing when that ridge pole was put in place and the rafters run down from it to rest on the sod walls, and then came the laborious task of putting on the sod roof so that it would keep out the rain and snow. At last it was completed and we moved in. The house had four rooms, which was unusual for such structures, and its two windows soon made it known all over that section of the West as the "Shack with the Glass Eyes.' There never was a more comfortable building erected than a sod house. They are not all damp, as one would suppose, and are warm as you could desire in winter, while in summer they are the most delightfully cool places imaginable. But they are rapidly disappearing now, and when you see one you are sure to find near it a modern cottage with its windmill, just as you do out at our place."

BUSINESS MOSAICS.

Samuel Kellett who as successor to Kellett & McMurray manufacturers of Plaster Decorations whose work at the Fair grounds have been so much admired, will take charge of the business at 28 Ellis street, San Francisco, 375 Twelfth street, Oakland, all business intrusted to Mr. Kellett in the way of decorating, plastering, repairing, etc., will be sure of being properly done you give the order and he does the work in the most satisfactory manner.

"I went to a fine dinner, last night, where all the folks and knives and spoons were of silver." "Let's see them."—*Hallo.*

When you want a Door Check and Spring be sure you call for the "Norton" which is always at hand and prevents slamming of doors. It is almost human in its action; use it and prevent any temptation to use bad words. Frank D. Morrell, 224 Market street near Front, San Francisco. Who wants to hear a door shut with a slam that sounded like a wooden dam.

"Johnny," said the teacher, "is a jackass a biped or a quadruped?" "Please, sir," said Johnny, "that depends on the jackass."

The California Art Glass Bending and Cutting Works.—An old saying has it, that "The profit counts for naught at home," this might be true as to profits proper, but does not apply to a home "Art Industry" we are to speak about. These remarks were prompted to us through inspecting the beautiful display of Art, Cut, Beveled and Embossed Glass in the annex of the Manufactures and Liberal Arts building at the Midwinter Fair, exhibited by the California Art Glass Bending and Cutting Works of 39½ Fremont street, of this city.

This firm undoubtedly could not have succeeded in placing such an elaborate and artistic display, which represents an outlay of several thousand dollars, as it stands, if they "counted for naught" in this community, for although their work can be found in cities all along the coast, it is principally this city and suburbs that enables them, by innumerable orders for their product, to employ such a corps of artists and artisans as can be seen at their works.

The exhibit is not merely a lot of samples placed indiscriminately, but a princely pavilion designed in the early Renaisance style, where art glass is placed in its proper sphere.

As the pavillion is only "A means to the end," that is, to show the ornamental glass to best advantage, we will abstain from describing the same although it would deserve mention from an architectural point of view.

The samples represented are of all kinds, suitable for churches, residences, public halls, etc.

One for instance, has the portrait of Beethoven in medalion shape in centre, while the balance of the light is filled with roundels of appropriate shading; it would make an admirable window for a music room. Front door lights, dining room, vestibule, hall windows with beautiful beveled glass scrolls, and delicate tints of opalescent glass, are represented.

We also saw splendid specimens of ornamental ground and cut glass suitable for interior lights such as in doors between dining and sitting room, etc. Advertising signs made by different processes form no mean part of the display; several are made in art glass, one on cut and ground glass, while others are embossed and silvered.

On inspecting the work closely we find that the workmanship is up to the quality of the artistic part of the same and in no way inferior to any work we have seen east. And now comes the most important part in the matter, that is the cost; we find that the price for the work done by this firm is one-third less than that for the same work done east, which is very natural as the commission to the agents and the freight on the goods, represents the difference. There are still more advantages than mere cost to the patron of this firm, these are promptness in furnishing the work; they can also oversee the construction of the same and if any changes are to be made, order them personally, instead of through third parties by letter. The home firm also takes pride in every piece of work that leaves its establishment, while the one, thousands of miles away, thinks anything is good enough in the Wild West.

We could give hundreds of other reasons why parties in need of ornamental glass should patronize home industry, but what we have said is enough, for as we remarked above the orders pouring in continuously to the works of this old firm on Fremont street, show conclusively that, "A Prophet" not always "counts for naught at home."

Little BOY—"I stayed in the parlor all last evening when Mr. Squeezem was callin' on sister, just as you told me. MOTHER—"That's a good boy, and here is the candy I promised you. Did you get tired?" LITTLE BOY—"Oh, no, we played blind man's buff, and it would have been lots of fun, only I was "it" nearly all the time."—*Good News.*

A. Steiger Sons, manufacturers of Architectural Terra-Cotta, Hollow Tile Fire Proofing, etc., have a very complete exhibition of the various articles manufactured by the firm, all neatly arranged and forming an object lesson in their line of goods, that a few years since would have been considered impossible to produce upon this coast, thus showing as the demand increases California is found able to produce any style of manufactured goods required; not alone for building purposes but to supply the wants of all departments of civilized life. A. Steiger Sons' manufactory is at San Jose, California, office, 16 Post street, Builders' Exchange, 5253, San Francisco, Cal.

Bobby (at breakfast)—"Clara, did Mr. Spooner take any of the umbrellas or hats from the hall last night?" CLARA—Why, of course not. Why should he?" BOBBY—That's what I'd like to know. I thought he did, cos I heard him say when he was going out: "I'm going to steal just one, and why, what's the matter, Clara?"—*New Castle Chronicle.*

Paraffine Paint Company.—In the Manufactures and Liberal Arts building, Exhibit No. 487, will be found a good representation of the products of the Paraffine Paint Co., 116 Battery street, San Francisco, including P. & B. Building Paper, as well as the roofing paper. A very clever method of proving that the building paper is waterproof and odorless may be seen in this exhibition is a case of raisins upon the fruit drying paper; this silent testimony is more convincing of the truth of the claim made for this paper than any words that could be written.

The fact that everything used in the manufacture of P. & B. goods is the production of the Pacific Coast is a strong argument why this company should be preferred when ordering goods in their line—the well-known reliability of this house is a good guarantee that everything that is sold by them is sure to be as represented.

Pullman Steel Frame Sash Balance. All intending builders are continually looking out for the best articles and materials in every line, consequently we take time and space to call the attention of the architects and others to the very best article on the market for the raising and lowering of windows, the Pullman Sash Balance. This balance is by no means new, having been on the market for about nine year and has been tested and used in thousands of houses, public buildings, flats, and factories and has given the very best of satisfaction.

On another page we show a cut of the side balance style and call attention to the fact that it is noiseless in its operation; that it is easily applied to old as well as new windows. In fact it is a perfect window balance in every respect.

Little GIRL—(looking at impressionistic landscape)—Mamma, what made him think it looked like that?"—*News Letter.*

Gas Lighting and Heating—This might properly be addressed to women only, as few women who have not made the experiment, know how much can be saved by using gas for cooking purposes. We know the general exclamation is "It costs too much!" It costs less, saves your time and temper, avoids all the bother and discomfort of coal and ashes and smoke, and the smell and discomfort in coal oil stoves. We advise all housekeepers to give gas a trial, and once tried, you will find you save money, time and annoyance.

"Are you going to the opera to-night?" asked a Parisian. "No; we had tickets, but we were afraid of bombs, and we gave them to some dear friends of ours."—*Hallo.*

Harris & Jones continue to fill all orders for yellow pine, sugar pine, white cedar and all kinds of building lumber, as well as doors, sash and blinds, their address is 728 Bryant street, bet. Fifth and Sixth, San Francisco.

Physician—"The truth can no longer be hidden, madam. I am obliged to tell you that your little son is—er—weak-minded. That is—well, it must be said—he is an idiot." MRS. HIGHUPP—"How fortunate it is that we are rich! No one will notice it."—*New York Weekly.*

The Misses Wilson & Kelley, Mills Building, room 45 6th floor, telephone 5661, do typewritting of all kinds in the most satisfactory manner—making however a specialty of architectural specifications.

Lena—"Fred didn't blow his brains out because you jilted him the other night; he came and proposed to me." MAUD—"Did he? Then he must have got rid of them in some way."—*Ex.*

Any one who has used the new and improved Chapman Fire Hose Reel will never be content to use any other. This admirable contrivance in the new design can truthfully be called an ornament, especially desirable for fine residences, as well as for hotels, theatres and modern office buildings. One satisfaction in ordering from Mr. R. S. Chapman is the purchaser can depend upon being furnished with a machine fully guaranteed to be what it is claimed to be; the most efficient and reliable Hose Reel Apparatus in the world.

Beautiful young lady (at hosiery counter)—"These stockings strike me as being rather loud." POLITE SALESMAN—"But consider how they would keep your feet from going to sleep."—*Harvard Lampoon.*

CITY BUILDING NEWS.

Baker near Page. Two-story frame; owner, Kate J. O'Donnell; architects, Martens & Coffey; contractors, Ackerson & Patterson; signed, March 24; filed, March 29; cost $4,500.

Broadway near Mason. Three-story frame; owner, M. Auragug, architect, Emil John; contractors, Schutt & Kreeker; signed, March 30; filed, April 2; cost $6,070.

Bryant and Butte. Two-story frame; owner, J. F. E. Ehlers; architect, H. Gellfuss; contractor, F. Klatt; signed, March 27; filed, March 27; cost $2,870.

California and Pierce. Block of six houses; owner, Mrs. M. L. Selfridge; architects, Reid Bros.; contractors, Bassett Bros.; signed, March 27; filed, March 30; cost $20,015.

California and Pierce. Plumbing, etc.; owner, Mrs. M. L. Selfridge; architects, Reid Bros.; contractor, H. Williamson; signed, March 27; filed, March 30; cost $4,454.

California and Pierce. Alterations and electric lighting; owner, Mrs. M. L. Selfridge; architects, Reid Bros.; contractors, Will & Fink; signed, March 27; filed, March 29; cost $802.

California near Pierce. Grading, concrete and brick work; architects, Reid Bros.; contractor, T. R. Bassett; signed, March 31; filed, April 4; cost $3,200.

Church near 15th. Two-story frame; owner, Matthew Murphy; contractor, H. L. Joslin; signed, March 26; filed, March 27; cost $1,650.

Clay near Mason. Three-story frame; owners, L. Peirano and I. Solari; architect, Emile Depierre; contractor, L. Cereghino; cost $4,980.

Cumberland near Dolores. To build; owner, S. L. Sutton; contractor, Eddie Cox; signed, March 27; filed, April 2; cost $2,040.

De Haro and Santa Clara. Carpenter work; owner, Fishback & Glootz; architect, J. E. Kraft; contractor, Jas. Campbell; signed, April 7; filed, April 10; cost $5,300.

De Haro and Santa Clara. Brick work; owner, Fishback & Glootz; architect, J. E. Kraft; contractor, I. F. Wagner; signed, April 7; filed, April 10; cost $4924.

Devisadero near Golden Gate. To build; owner, D. Courneer; contractor, R. Sinnott; cost $5600.

East near Mission. Fit up saloon; owner, Claus Flotham; contractors, Bader & Fincke; filed, March 16; cost $1,250.

Ellis and Jones. Moving and raising; owner, Julia Green; architect, W. H. Lillie; signed, March 20; filed, March 20; cost $7,000.

Ellis near Pierce. Mill work on two two-story houses; owner, M. J. Kelly; architect, A. J. Barnett; contractors, Excelsiors M. Co.; signed, April 4; filed, April 6; cost $1150.

Fell near Lott. To build; owner, Edward Warton; contractors, Petterson & Person; signed, March 27; filed, March 27; cost $4,800.

Fifth Ave. and Clement. To build; owner, C. Mohemann; contractor, E. Ginley; signed, April 2; filed, April 2; cost $1,800.

Fourth Ave. near California. To build; owner, Oswald Schultz; contractor, Richard Fahy; signed, April 5; filed, April 6; cost $1200.

Fillmore near Jackson. Plumbing, etc.; owner, Sarah Kahns; architect, E. A. Hermann; contractor, H. Williamson; signed, April 9; filed, April 10; cost $1,594.

Fremont near Market. Alterations, etc.; owner, Huntington, Hopkins Co. contractors, Robinson & Gillespie; cost $4,275.

Fourteenth and Guerrero. To build; owner, M. Roth; architect, M. J. Lyons; contractor, E. McCugh West; signed, March 22; filed, March 26; cost $3,025.

Grove near Polk. To build; owner, M. Corney; architect, D. M. Stanley; contractor, S. G. Worden; cost $2,675.

Geary near Franklin. Carpenter, mill work, etc.; owner, Babetts Brown; architects, Saifield & Kohlberg; contractor, Henry Rohling; signed, April 2; filed, April 6; cost $6975.

Haight near Broderick. To build; owner, W. Jones; architect, J. J. Clark; contractor, W. W. Rednall; signed, March 21; filed, March 22; cost $2,282.50.

Hermann near Stevenson. To build; owners, John and Sarah Whalan; architect, T. J. Welsh; contractor, James Geary; signed, March 22; filed, March 26; cost $3,998.

Howard near First. Three-story building; owner, E. Roesch; architect, Oliver Everett; contractor, James Campbell; filed, March 14; cost $4,240.

Howard near 23d. To build; owner, Henry Stelling; architects, Martens & Coffey; contractor, J. Bucher; cost $8,850.

Jackson near Locust. To build; owner, L. B. Cooper; contractor, F. G. Kronnick; signed, March 27; filed, March 27; cost $3,200.

Jackson near Laguna. Plumbing and sewering; owners, Walter Speyer and wife; architects, B. McDougall & Son; contractor, H. Williamson; signed, March 23; filed, March 29; cost $1,448.

Jackson near Webster. Painting school building; owner, Board of Education; architect, C. J. Havens; contractor, W. J. Bell; signed, April 3; filed, April 6; cost $289.

Landers near Fourteenth. Two-story frame; owner, John Kelvin; architect, A. J. Barnet; contractor, Jas. Cochran; signed, March 23; filed, March 27; cost $2,160.

Market near Fifth. To remove old building and excavate; owner, F. Gutzkow; architect, E. Kollofrath; contractor, A. E. Buckman; signed, March 17; filed, March 17; cost $1,250.

Market near Fifth. Excavating foundation; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, A. E. Burbank; signed, March 20; filed, March 20; cost fifty cents per cubic yard.

Market near Fifth. Concrete work, etc.; owner, Mrs. A. M. Parrott; architects, Pissis & Moore; contractor, Geo. Goodman; signed, March 22; filed, March 24; cost twelve cents per cubic foot.

Market near Post. Hollow partitions, etc.; owner, Walter S. Hobart by Exrs.; architects, Pissis & Moore; contractors, Mahl Bros. & Co.; signed, March 19; filed, March 21; cost $4,270.

Market near Post. Alterations and fittings; owner, Walter S. Hobart by Exrs.; architects, Percy & Hamilton; contractors, The Jackson Mfg. Co.; signed, March 19; filed, March 21; cost $2,373.

Market near Post. Iron furring; owner, Walter S. Hobart by Exers.; architects, Percy & Hamilton; contractors, Dyer Bros.; signed, March 19; filed, March 21; cost $2,128.

Market street, 730. Saloon and cigar store fixtures; owner, Jessie E. Marks; architect, A. J. Barrett; contractors, Ackerson & Peterson; signed, March 20; filed, March 21; cost $2,000.

Market street, 749. Additions and alterations; owner, Robert Flint; architect, H. B. Maggs; contractor, J. W. Wissinger; signed, March 22; filed, March 22; cost $7,116.

Market street, 810. Show case and fixtures; owner, Geo. Hass; contractors, Fink & Schindler; signed, March 21; filed, March 22; cost $2,800.

Maket near City Hall Ave. Cast and wrought iron; owner, B. Schweitzer; architect, Chas. R. Wilson; contractor, Jos. Kemp; signed, March 23; filed, March 24; cost $11,141.

Market near City Hall Ave. Excavating, etc.; owner, B. Schweitzer; architect, Chas. R. Wilson; contractor, Andrew Lynch; signed, March 23; filed, March 24; cost $4,075.

Main near Mission. Two-story brick; owner, Mrs. E. A. Rutherford; contractor, S. S. Emery; signed, March 22; filed, March 30; cost $12,000.

McAllister near Jones. Marble work to 4-story brick; owner, E. Adam and E. Kibbe; architect, J. E. Kraft; contractors, Ruffino & Bianchi; signed, March 30; filed, April 5; limit 40 working days.

Mission near Main. Brick; owner, S. S. Emery; contractors, Richardson & Gale; signed, April 4; filed, April 4; cost $4300.

Mission near Virginia. A brick car house; owners, Pacific Improvement Co.; contractors, T. H. Day & Sons; days work, cost $46,000.

Mission near Park. One-story cottage; owner, Cornelius Cronin; contractor, Thomas Mitchell; cost $1,350.

Natoma and First. Four-story brick; owners, Mrs. Eliza F. Grosh; architect, Wm. Patton; contractors, Richardson & Gale; signed, March 12; filed, March 13; cost $11,225.

Oak near Scott. Alterations, etc.; owner, John Postel; architect, H. Gellfuss; contractor, F. Klatt; signed, March 20; filed, March 21; cost $1,355.

O'Farrell near Laguna. Two-story frame; owner, Sarah N. Morris; architect, J. H. Littlefield; contractors, Blanchard & Clark; signed, March 13; filed, March 17; cost $4,360.

O'Farrell and Taylor. To build; owners, Rose Boland and Emily Flood; architect, T. J. Welsh, contractor, T. R. Bassett; signed, March 27; filed, March 27; cost $10,345.

O'Farrell near Stockton. To build; owner, H. Gutzeil & J. Molfante; architects, Pissis & Moore; contractors, C. K. Worrell and S. W. Miller; signed, April 2; filed, April 4; cost $29,667.

Page and Webster. Frame buildings and alterations; owner, Pane Levy; architect, A. T. Barnett; contractor, Jno. Ogle; cost $1,765.

Pine bet. Scott and Devisadero. Two-story building; owner, Samuel Deutsh; architect, M. J. Lyons; contractor, Thos. Kinread; signed, March 19; filed, March 26; cost $3,550.

Pine near Treat Ave. Brickwork, etc; owner, Kate C. Kirkham; contractor, Geo. B. Lang; cost $2650.

Point Lobos near Ferrie. Alterations; owner, C. Taubles; architects, Bugbee & Gash; contractor, L. N. Fletcher; signed, March 6; filed, April 4; cost $1879.

Post near Devisadero. To build; owner, H. A. Rosenbaum; architect, M. J. Lyon; contractor, H. Rohling; signed, March 28; filed, April 5; cost $7650.

Point Lobos and Fifth Ave. Cottage; owner, John Burgogne; contractor, Edward Ginley; filed, March 19; cost $1,484.

Post and Montgomery. Deposit boxes and vaults; owner, Union Trust Co.; architect, Clinton Day; contractors, Diebold Safe and Lock Co.; signed, 16; filed, March 19; cost $11,158.

Sacramento near Central Ave. Two-story frame; owner, Chas. Clark; contractor, C. Zwierlien; signed, March 28; filed, March 29; cost $4,000.

Stevenson near Ninteenth. Alterations and additions; owner, Michael Lynch; contractor, William Burk; signed, April 2; filed, April 2; cost $1,600.

Steiner near Haight. Materials and mechanical works; owner, Margaret Glein; architects, Townsend & Wyneken; contractor, C. S. Dunshee; signed, March 15; filed, March 16; cost $2250.

Shotwell near 26th. To build; owner, Martin Seatena; architect, G. Ratto; contractor, H. McCracken; signed, March 19; filed, March 20; cost $5,122.

Sutter bet. Webster and Fillmore. Cottage; owner, Sophia Ettinger; architects, Townsend & Wyneken; contractor, N. C. Post; signed, March 22; filed, March 22; cost $2,000.

Twenty-first near Treat Ave. Two cottages; owner, R. H. Cowan; architect, J. F. Kenna; contractors, Noland & Sheebley; signed, March 27; filed, March 29; cost $2,636.

Tenth Ave. near Point Lobos. To build; owner, Wm. Domrone; architect, H. Gelfuss; contractors, Flood & Watson; signed, April 5; fied, April 16; cost $1180.

Union and Taylor. Excavating; brick, carpenter and mill work, etc.; owner, S. Lazarus; architects, Salfield & Kohlberg; contractors, T. H. Pauls & W. H. Wilton; cost $5,727.

Union near Octavia. To build; owner, Bertha Michelson; architect, C. M. Rousseau; contractor, L. B. Schmidt; signed, April 4; filed, April 4; cost $2980.

Van Ness and Myrtle Ave. Plant for elevator works; owner, C. F. Buckley; architect, M. J. Lyon; contractors, Pettit & West; signed, March 1; filed, March 26; cost $2,780.

Valencia and Quinn. Moving three houses; owner, S. B. Melone; architect, Clinton Day; contractor, E. E. Otterbach; signed, March 31; filed, April 3; cost $1000.

Vallejo near Stockton. To build; owner, C. Southern; architect, H. Gellfuss; contractors, Schutte & Krecker; signed, April 8; filed, April 9; cost $3198.

Waller near Webber. Two-story frame; owner, E. Taylor; contractor, David Reis; signed, March 21; filed, March 22; cost $1,675.

Space	1 Month.	3 Months.	6 Months.	12 Months.
1 Inch	$ 1 50	$ 4 00	$ 7 50	$ 13 00
3 Inch	4 00	10 00	18 00	35 00
6 Inch	7 50	18 00	32 00	60 00
1 Column	12 50	35 00	65 00	125 00
½ Page	20 00	57 50	105 00	200 00
1 Page	40 00	110 00	200 00	350 00

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

ONE of our esteemed contemporaries in a late issue calls the attention of the officers of the various fire departments to the unreliability of concrete as a fire-proof building material, and warns them of the dangers which may attend its use, especially in the basement or foundation portions of walls, where during a conflagration it would be subject to the combined action of fire and steam.

In a later issue he approves of the use of concrete in combination with iron, as a material for the construction of floors, and informs us that when constructed in this intelligent manner, concrete is not subject to the same conditions as mentioned in the former article.

Indeed! Why isn't it?

IT must be a satisfaction to the Directors of the Midwinter Fair to have such testimony in its favor coming from the authority of H. N. Higinbotham of Chicago, when we remember that Mr. Higinbotham was President of the World's Columbian Exposition, words of praise coming from such a quarter must be welcomed by the managers. Mr. Higinbotham is reported to have said: "As to my visit to the fair I think I saw it at its best, and it was a sight that made me feel at home. It is a beautiful fair; the buildings are imposing and grand, and it deserves the patronage and best wishes of the entire coast." We have not space in this number to give our impressions of the general effect, and can only say the more you see of this Exposition the more you want to visit it again.

THE reason why long before this the city should not have decided to carry all the tubing, etc., necessary for the public service in a safe and commodious place and in a sensible manner is rather hard to surmise—but so it is. There is, however, a simple and costless method of doing this which we take this opportunity of bringing before our readers. This is a method that no doubt has entered the minds of many—but which, we believe has never been published in a periodical before.

We have already on all our main streets cellars under the sidewalk attached to the stores. Why may not part of these be used for the purpose above mentioned? They are in the street and the space is public property.

Now say that our Supervisors think it about time that the unsightly poles *above* ground and the never ending disturbance of traffic *on* the ground and the destruction of good roads by tearing up for the purpose of getting to the public service pipes *under* ground should be done away with. They then notify the property owners along say Market street

first as being the most important, that the city is about to resume its right to say one-half the space under the sidewalk. It then proceeds to build a wall longitudinally in the centre of the sidewalk, separating public from private part, the public part being that nearest the curb. Meanwhile it recoups each property owner for his expenditures in making that part of the sidewalk taken by the city, and recompenses itself for this by an annual rental to be paid by the several companies now using the public street Conduits for telephone, telegraph, water, gas and sewerage and pneumatic tubes for the use of the Post Office, will all run in this alley, which will be lighted and ventilated at and above surface of pavement.

Ordinances are past directing the several companies against destroying the public highway by digging therein and they thus will be compelled to use the Municipal alley or passage.

Such then is in outline a method of making one of the most important public improvements in a manner which will harm nobody and make a vast improvement in the public health and morals.

It will harm nobody—the property owner or tenant will be fully recompensed for his loss of cellar space by the much better facility of making his connections for plumbing, gas-fitting, telephone, etc., as well as the relief from all interference with his business and clientage by the disturbance of the surface of street or sidewalk—which is now quite an item. Also he saves much by being able to get at all times to his sewerage and other pipes in an easy and quick way.

The companies supplying the public will not suffer as the first cost of removing their present tubes will be the only outlay, and that will be repaid to them in a very few years by the amount saved in being able to get at their tubes to repair or replace them or for any other purpose without any cost. The small annual rental will no doubt be charged by them upon their customers which being distributed all over the city will be an infinitesimal amount to to each one, and even that will be amply repaid to the inhabitants by the general benefit accruing to them in having good roads and pavements.

The citizens considered as organised into a municipality will also not be damaged, for the original outlay which will be small will be all repaid to it in a short time by the rental of its alley and after that said rental will be pure gain, to be used in further extending the system without any expense to the city.

Finally—both the public health and morals will be improved by this system. The first by the facility by which leaks of noxious gases and fluids can be stopped and the latter by removing an offense and nuisance to the public eye and nose, and saving a certain amount of profanity and ill temper caused by stumbling blocks in the way of the traveller.

The shoot of the rubbish boxes which are now being placed along our streets at the instance of our Ladies Sanitary League for the reception of the orange peels, bits of paper and other rubbish which now so conspicuously adorn our roads and sidewalks, will also be connected with receptacles in the subway and be periodically cleaned out by scavengers; all disagreeable sights and smells being thus immediately removed from the public senses.

Now that the City Hall will be finished before the year is out to what better purpose could the money which will then be at liberty be applied? This should be made a burning question next election.

SHALL TWO ELECTRIC WIRES BE RUN IN A SINGLE CONDUIT.

PROCEEDINGS of the Eighteenth Annual Meeting of the Fire Underwriters Association of the Pacific, which have just been issued, contain a full and complete discussion from a practical standpoint of the question that is so often raised among architects as to the advisability of placing two wires of opposite polarity in a single tube or conduit. The discussions referred to is contained in the report made by Mr. Geo. P. Low, Electrician of the Pacific Insurance Union and who constitutes the Permanent Sub-Committee of the Electric Committee of the Underwriters' International Electric Association, and is published below in full for the first time.

REPORT OF SUB-COMMITTEE ON INTERIOR WIRING.

C. M. Goddard, Secretary Underwriters' International Electric Association, No. 55 Kilby street, Boston:

Dear Sir:

The permanent sub-committee on Interior Wiring and Wireways has to report as follows with reference to the proposed amendment "E" to Rule 22 (edition of October 1, 1893), requiring that "wireways must not be supplied with twin conductors, or two separate conductors, in a single tube."

If two wires of opposite polarity are in actual contact throughout their length, trouble may occur in the following ways:

Case 1—Overheating of the conductors from a dead or partial short circuit, the circuit being excessively fused.

Case 2—A dead or partial short circuit or a heavy leakage in an excessively fused circuit may burn off a wire at the point of contact, which may occasion—

Case 3 Arcing, the heat of which will cause—

Case 4—Ignition of the insulation.

Case 5—The insulation, if wet, may be ignited from electrolytic action.

Case 6—A partial short circuit or current leakage resulting in the electrolytic liberation and ignition of explosive gas.

Assuming these wires to be in contact throughout their length and exposed in open air, incipient fire will be caused by the occurrence of any accident except that cited in Case 6, in which the gases will be dissipated and rendered non-explosive. Case 6 presents the only hazard distinctive to wireway construction, in which the liberated gases are confined, but, as yet, the hazard is a theoretical and not a practical one. But one accident that might be attributed to the cause assigned in case 6 has been cited. In this an explosion occurred in a vertical conduit imbedded in a side wall. No fire resulted therefrom and no damage occurred beyond the breaking of plaster. Considering the fact that a short circuit will sometimes occasion considerable violence, it is as probable that the accident was due to this cause as to an explosion of liberated gases, as charged.

But admitting for the moment that the explosion did so occur, it could only have been due to the presence of moisture in the tube. If the ends of interior conduits are closed, per Rule 22, circulation of air through the tube, with consequent condensation and precipitation of moisture, is rendered impossible. The explosion would then be the direct result of a violation of the requirements and would be chargeable accordingly. Again, conditions favorable to condensation within tubes are far more propitious in fire-proof buildings than in wooden ones, which further depreciates this hazard. The opinion is held, therefore, that the occurrence of fire per Case 6 is extremely improbable, if not impossible.

Cases 1 to 5 inclusive resolve themselves into two ultimate classes when the conductors are exposed in air. They must also be contiguous to ignitable material, otherwise fire could not ensue. These two classes are:

1. Ignition of foreign inflammable material from a heated wire, and

2. Ignition of foreign inflammeble material from the flame of burning insulation or of an arc.

It may appear that Class 2 embodies the situation, but experiment proves Class 1 (Case 1) to be distinctive for the reason that invariably overheated wires will ignite some foreign substance, such as wood joist, or cleat, which in turn ignites the melted through insularion—not *per contra*. The danger presented is apparent.

If the wires are encased in wireways, the hazards presented in Cases 1 to 5 and as summarized in Classes 1 and 2, are at once obviated. Experiments made before various underwriters' organizations and elsewhere, have led to the acceptance of the fact that conduit will safely confine two overheated wires, which obviates the danger presented in Class 1. The occurrence of fires from the cause summarized in Class 2, namely, the ignition of foreign inflammable material (1) from the flame of burning insulation and (2) from the flame of an arc, is fully obviated in the facts (1) that combustion (oxidization) cannot exist in a closed tube, and (2) that an arc will burn away the insulation, bringing bare wires into short circuit and throwing the current off the wires through the blowing of the fuse.

The use of two wires in a single tube, therefore, averts the hazards enumerated in Cases 1 to 5 inclusive, which are well established and positive, and presents only the doubtful danger cited in Case 6, which is theoretical. Again, the use of twin wire lessen the hazard from grounding by localizing grounds, owing to the proximity of wires of opposite polarity in a single tube. Furthermore, the carrying out of Rule 22E in its present form increases the cost of conduit installation by from 25 to 75 per cent., varying with the character and size of the building.

The Electric Committee has heartily endorsed and recommended the general use of wireways for rendering concealed wiring permanently accessible because of the extraordinary and perfect facilities afforded therein for universally effecting safe electric wiring. Consistency therewith cannot be attained through the enaction of unnecessary restrictions which vastly enhance the cost of wireway construction and prove effectual in retarding its introduction and general use.

Your permanent committee on Low Potential Inside Wiring, Concealed and in Wireways, therefore, recommends the modification of Rule 22E so as to read as follows:

22. Interior Conduits.

E. Must not be supplied with twin conductors, or two separate conductors, in a single tube, except in ultimate circuits carrying current not in excess of five amperes.

Respectfully submitted,

Geo. P. Low,
Committee.

THE BUILDERS' EXCHANGE BANQUET.

MEMBERS of the Builders' Exchange enjoyed themselves and entertained their friends on the evening of the twenty-fifth of April by a banquet spread in their spacious rooms on Post street.

About three hundred persons sat down to the well filled tables, and comfortably disposed themselves to attack the tempting viands, and applaud to the echo the sentiments that fell from the ready tongues of the orators and the wits, when after many bottles of California's best vintages had been emptied, Chas. C. Terrill, the President of the Association, introduced the toast master, Oscar Lewis, who replied to the toast "Our State and Country."

Architect Geo. W. Percy, in behalf of the members of his profession, gave a sketch of the progress of architecture and building since the early days, and commented hopefully on the downfall of the wooden shams of former times, and the real advancement in the art of building as it exists to-day, where better and more enduring materials are used with better knowledge of their properties and greater skill in their combinations with regard to convenience, durability, use and beauty.

Mr. Terrill in speaking of the "Builders' Exchange and Building Interests" emphasized the fact most strongly that the progress of the building interests kept pace with, and was the best indication of the advancing intelligence and civilivation of the human race. That the degree of progress attained by man through all ages, was truly measured by the fitness of the habitations which he constructed, and the evidence of refinement in the homes which he built, and his hearers were quick to see the natural inference, that the present age is applying the knowledge and experience gained by our forefathers in a manner highly satisfactory to its self-esteem.

Mr. M. J. Donovan, one of the orators of the evening, responded to the toast of "Our City and County," and in eloquent language pictured the future greatness of San Francisco and compared her advantages with those enjoyed by the famous cities of the Old World.

Mr. W. Winnie the President of the Oakland Exchange, replied on behalf of "Our Sister Exchanges" and Jas. E. Britt wittingly described the cordial relations that should always exist between the client, his architect and his builder.

Mr. H. T. Bestor, so long connected with the California Architect and Building News, spoke a few well chosen words on "The Press." and Mr. S. H. Kent responded to the toast of "The Ladies."

The meeting was a practical example of the mutual good fellowship that exists between the members of the Exchange, and the cordial relations it is their aim to foster between themselves and the business world.

In conclusion we trust the California Architect and Building News may witness on future occasions equally as enjoyable reunions that will stretch out and beyond into a long vista of similar events, marking the continued success, and increasing popularity of that thriving association, whose hospitality was so greatly enjoyed—The Builders' Exchange.

INROADS ON THE ART OF ILLUSTRATING.

IN view of the inroads being made by photography and its allies upon the art of illustration, it is quite time to stop long enough to take an account of stock. If we are by an undue patronage of the photographic devices of the time, to discourage that prince of illustrators, the modern wood engraver—and there are even now signs that his vocation is going—the photograph will have much to answer for. There is a mournful side to the fact that the modern illustrated magazine is "marked down." While the world wants cheap pictures, it cannot afford to do without the artist. Of course the people who prepare the half-tone and its kindred for use, would resent the inference, but nevertheless, however valuable and in some ways superior for the purposes of illustrating, these photographic devices may be, they must still remain in the category of scientific inventions and cannot rise to the class of creative art. Despite the fact the photo-mechanical devices have done so much for bringing out the pen-and-ink artists, giving us *fac similies* of his work, wherewe usep to be obliged to take the engraver's

interpretation of it, it is well to keep constantly in mind that this is about the only field where the photographer and his allies have had the best of it, and it was not the proper field for the engraver at any time. The past three decades have brought out a school of artists-engravers on wood, whose achievements may be said to stand at the head of artistic progress for the period, but reports come with painful frequency that these men are drifting into something else for want of employment in their own calling. We are getting in place of their work mainly the "half-tone" and it is none too soon to set seriously about it and make an estimate of what we are losing artistically by the change.—*The Architect, Builder and Decorator.*

THE OWNERSHIP OF DRAWINGS MADE FOR AND BY AN ARCHITECT.

[*Continued from April Number.*]

AN architect's contract with his employer, where the former works on commission, is that the architect will make the usual professional charges, and will be liable to the client for any responsibility incurred by himself or assistants. But the client and his friends understand the matter very differently. They say: "Architect A contracted with friend B to build B a house for £900; yet it has cost £1,200 and ruined B." The architect says that there was not any contract in that case; that the original order was for a £900 house, that his original sketches were for a £900 house; that B, with his family, made additions in size and quality to match what they saw at their neighbor's; that the lowest tender was £1,200, and that B said, "Cut it down as much as possible, but I shall have something more like what I want than you at first designed;" and that, in process of construction, the builder gets orders from B to an amount that fills up the cutting down. Furthermore, our lawyers fall into the verbal trap, and insist on supposing that the architect's contract drawings bind him to the client; on the contrary, the client is bound by them to the builder, and the builder to the client, no variations being usually allowed unless ordered by the architect, or architect and client, in writing. When an architect takes a commission for the erection (I omit the words "the alteration") of a building, he undertakes the production of such a building to the best of his ability, which may improve as the work proceeds. He may write what directions he likes, and so describe his plan as to make a drawing unnecessary (remembering Michael Angelo's celebrated letter to Vasari about the stairs to the Florentine Library); or he may illustrate his letter with diagrams, or his diagrams may be so full as to leave little occasion for writing to it at all. Still his signature constitutes it a letter, for which he is responsible, and which, according to all the text-books on property, belong to the sender, not to the receiver; and, by the way, if a perspective view, highly-colored, be stolen, the value is that of the paper on which it is made.

These diagrams may be a plan, an elevation, a section, a perspective view in free hand or geometrical work; the size of the paper does not affect the fact that they are protected as letters so far that if a piratical publisher sought to print them he would be open to an injunction to leave out all the accompanying explanatory writing. Moreover, the illustrative details in other diagrams, drawn by another person not in the employment of the architect, become the property of the architect as soon as his signature thereto makes him responsible for the directions given thereon.

If the architect be represented as the owner, and the drawings in question have been appended in fact or in schedule to a contract, the thief may say that they are the client's property (it will be impossible to deny that a contract is the client's property), and so escape conviction; on the other hand, if the client be represented as the owner, and the drawings in question never have been appended in fact or in schedule to a contract, the thief may say that they never were the client's property, or at least, that they are the joint property of the architect and client, and so escape conviction. In both these cases it must be observed that the indictment will be framed for stealing the papers (say value 40*s.*), and not for stealing the drawing (say value £4 or £40), by which the property in the papers is proved. Under peculiar circumstances (if known to the thief) a third line of defence might be taken; for he may say that the drawings, having been sent by the architect to the client for transmission to the builder, had become the joint property of the architect and client and so escape conviction.

The subject of the joint property of the architect and client in a drawing is one of the highest importance. An architect's drawings for a work executed upon commission, say of five per cent, appended in fact or in schedule to a contract, have the nature of a written document, and are liable to be stamped accordingly; it will be impossible to deny that the contract is the client's property; the property in the drawings passes, with the implied consent of the architect, entirely to the client, who in the present state of the law of artistic copyright, evidently has the power to sell or lend or publish them, as well as to use them again for another locality. The practice is, of course, reprobated by the profession, which herein cannot help itself.

An architect's drawing for such a work not so appended to the contract, whether made before the contract is signed or at any time subsequently, is an explanation of the subject of the contract, and is as entirely his property, to deal with as he likes, as if it were blank paper, until the moment that it leaves his office with his signature authorizing the execution of the work in the way there shown, at which time it becomes invested with the character of a letter. If any number of copies of such a drawing may have been made in the office, they still remain the property of the architect, even when he has selected the best executed among them for signature for transmission, and he may put them as patterns before his pupils for further copies, or he may publish them. The client has no power to interfere.

Moreover, if the architect chooses to tear up, not only his sketches, but his finished drawings, one after the other, as soon as the works which they show are executed, it might not be prudent, but is clearly within his power to do so. If Sir C. Barry neglected, before his disease, to destroy his papers, that neglect did not transfer his right to burn them to the Government. If a member of the Government had chosen to order Sir C. Barry to deliver up, from time to time, his sketches and drawings, so that they might be officially destroyed, the matter would have been so ludicrous that it could not have been sustained. Official destruction is not so far from official preservation as might be supposed. The Government itself cannot produce all the drawings made by its salaried officials from the fire of London to the Reform Bill.

From the first sketch of the ideas of an architect working on a payment by commission, to the picture representing the extent or intended result made by an artist for the architect, the paper on which those drawings are made remains the property of the architect, not of the client, and can be transferred by the former to any one; and further, the client has no right to select such as he would like to possess, even if he tender the value of the materials and workmanship.—*A paper by the late John W. Papworth, published in the Journal of the Royal Institute of British Architects.*

ROUGH-CASTING IN CANADA.

By Fred. T. Hodgson, Architect.

ROUGH-CASTING, or as it is sometimes called, slap-dashing—both words of which are synonymous with the French *hourdage*, rough work, and *ravalement*, having a similar meaning—is a method of plastering the outside of buildings much used in the northern part of Canada, because of its being durable, cheap and well adapted to keep out cold winds during our long winters. The methods of applying rough-cast and the mixing thereof do not materially differ in this country from the methods adopted in northern Europe or even in the Northwestern States, but it is these minor differences, perhaps, that make the rough-casting done in this country superior, so far as durability is concerned, to much that is done in other parts of the world.

There are frame cottages near the city of Toronto and along the northern shores of Lake Ontario that were plastered and rough-casted exteriorly over forty years ago and the mortar to-day is as good and sound as when first put on, and it looks as though it was good for many years yet if the timbers of the building it preserves remain good. Rough cast buildings are plentiful in every Province in the Dominion from Halifax to Vancouver and from Lake Erie to Hudson Bay, and when well built, and the rough-cast properly mixed and properly applied, the result is always satisfactory. It is quite a common occurrence in Manitoba and the northwest Territories in the winter to find the mercury frozen, yet this intensity of frost does not seem to effect the rough-casting in the least though it will chip bricks, contract and expand timber and render stone as brittle as glass in many cases, and the effect on iron and steel is such as may prove dangerous if exposed to sudden and unexpected strain.

In preparing a frame or log building for rough-casting care must be taken in putting down the foundation. A good stone or brick foundation is of course, the best, but where rough-casting is intended stone or brick foundations are seldomed used, because of their cost, and the builder is compelled to use posts of wood. Here the posts are generally made of white cedar, which has a lasting quality of thirty-five or forty years, if sound when used. The posts are put in the ground from three to five feet, the deeper the better, as they should be deep enough in any case to preven frost from forcing them upward. When a sufficient number of posts have been properly placed a line is struck on them the proper height from the ground and the tops leveled off. The sills are then placed—all joints being broken on top of posts—and the whole made level. These sills and all the other timber, scantlings and lumber should be well seasoned, if possible, for the greatest enemy to the plasterer is unseasoned timber; shrinkage of joists, posts and scantling not only breaks the bond of the mortar, but causes great cracks in corners and angles that no amount of pointing or patching can ever make good.

When the frame is up and the rafters on and well secured the whole of the outside should be covered with good, sound, common inch stock pine, hemlock, spruce or other suitable lumber, dressed to a thickness. If put on diagonally so much the better, but this is not absolutely necessary if the rough-casting is to be of the best quality, as will appear hereafter.

When it can be done it is best to get all partitions set in place and lathed, the roof on and all necessary outside finish or grounds put in place and made ready to receive the lath. The carpenter must prepare his finish or grounds for finish to accommodate the extra lath, as the wall will be thickened accordingly.

For the cheaper sort of rough-casting in one or two coats the following method of lathing is employed: Nail laths on the boarding—over paper or felt, if paper or felt is used—perpendicularly sixteen inches from centre to centre if four-foot laths are used, or eighteen inches or one foot from centre to centre if three-foot lath are used. The whole surface to be rough-casted will require lathing this way. When done lath as is ordinarily done with No. 1 pine lath, breaking joints every fifteen inches. Put five nails in each lath, driving each nail home solid, coat over with mortar, well haired, and that has been made four or more days; smooth and straighten as well as possible with a darby. When done and while yet soft the rough-cast is thrown on it with such force as to drive the pebbles or small stones deep into it. The mixture or dash as it is called, is composed of fine gravel, clean washed from all earthy particles and mixed with pure lime and water till the whole is of a semi-fluid consistancy. This is mixed in a shallow tub or pail and is thrown upon the plastered wall with a wooden float about five or six inches long and as many wide, made of half-inch pine and fitted with a wooden handle. While with this tool the plasterer throws on the rough-cast with his right hand he holds in his left a common whitewash brush, which he dips into the rough-cast and then brushes over the mortar and rough-cast, which gives them, when finished, a regular, uniform color and appearance.

For this sort of work the following proportions will answer: To one barrel of prepared gravel use a quarter barrel of lime putty; mix well before using. This may be colored to suit the taste by using the proper materials, as given further on. It must be understood that the foregoing is the cheapest sort of rough-casting and is not recommended where more durable but more expensive work is required.

The best mode of doing this work as practiced in the lake district of Ontario is about as follows: Have the frame of building prepared as indicated in the foregoing, with partitions all put in and well braced throughout and well secured.

Lath diagonally with No. 1 pine lath, keeping one and a half inches space between the lath. Nail each lath with five nails and break joints every eighteen inches. Over this lath again diagonally in the opposite direction, keeping the same spaee between the lath and breaking joints as before. Careful and solid nailing is required for this layer of lathing, as the permanency of the work depends to some extent on this portion of it being honestly done. The mortar used for the first coat should have a goodly supply of cow's hair mixed in with it and should be made at least four days before using. The operator must see to it that the mortar be well pressed into the key or interstices of the lathing to make it hold good. The face of the work must be well scratched to form a key for the second coat, which must not be put on before the first or *scratch coat* is dry. The mortar for the second coat is made in the same way as that required for the first coat and is applied in a similar manner, with the exception that the scratch coat must be well damped before the second coat is put on in order to keep the second coat moist and soft until the dash or rough-cast is thrown on. The rough-casting is done exactly in the same manner as described for the cheaper sort of rough-cast work.

A building finished in this manner, if the work is well done, possesses many advantages over the ordinary wood covered structure. It is much warmer, being almost air tight so far as the walls are concerned. It is safer, as fire will not eat its way through work of that kind for a long time. It is cleaner, as it will not prove such a harbor for insects. It may be made as handsome as desired, for, before the rough-cast is dashed, it may be laid off in panels of any shape by having strips of battens tacked over the soft mortar, which may be removed after the rough-casting is done and the coloring finished. It is much superior to the so-called brick veneered house, as it is warmer, more exempt from fire and cheaper.

For 100 yards of rough-casting in the manner described the following quantities will be required: 1,800 lath, 12 bushels of lime, 1½ barrels best cow hair, 1¾ yards of sand, ¾ yard of prepared gravel and 16 pounds of hot cut lath

nails, 1¼ inches long. The gravel should be sifted through a half-inch mesh screen, and should be washed before mixing with the lime putty.

To color 100 yards in any of the tints named herewith use the following quantities of ingredients: For a blue-black mix 5 pounds of lamp black in the dash; for buff use 5 pounds of green copperas, to which add 1 pound of fresh cow manure, strain all and mix well with the dash. A fine terra cotta is made by using 15 pounds of metallic oxide, mixed with 5 pounds of green copperas. A dark green color is made by using 5 pounds of green copperas and 4 pounds of lamp black. Many tints of these colors may be obtained by varying the quantities given. The colors obtained by these methods are permanent; they do not fade or change with time or atmospheric variations. Many other colors are used, but few stand like the ones named. A brick color may be obtained by the use of Venetian red and umber mixed in whiskey first and then poured into the dash until the proper tint is obtained. In time, however, like all earthy pigments, these colors fade and have a sickly appearance; they answer better in cements than when incorporated with fat limes.—*Architecture and Building.*

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

SKETCH of a Ranch House is by Clarkson Swain.

A Study for a Public Library is by W. Jones Cuthbertson Architect.

A Residence on Washington street is by Polk & Gamble, Architects.

THE Design accepted for Oahu College, Honolulu, is by Architects Ripley & Reynolds.

NOTES AND COMMENTS.

The most profitable street railway in the world is the Broadway cable in New York, which is now said to be earning fifty cents per car mile, the biggest record ever made by a street railway company. It is understood that it is operated for one third the gross on its very large earnings. The Brooklyn street railway company has downed the elevated road in the city of churches by the introduction of the trolly, and it is now reported to be a serious question as to what will be done with the elevated structure.—*Illustrated Electrical Review.*

One of the smallest offices in New York city is that occupied by an electrical contracting firm in the Havemeger building. The office is four feet wide and eight feet long. But there is not in the arrangement of desks and furniture an inch of waste space. Even the electric radiator which heats it is small and out of the way. It is reported in these lilliputian quarters the firm does a business of $75,000 per year.—*Illustrated Electrical Review.*

[We published last month a communication from a correspondent concerning the fire-proof qualities of concrete, who signs himself "Consistency" in which the writer misquotes from Thaddeus Hyatt's work on "Portland Cement Concrete Combined With Iron as a Building Material." The following letter from Mr. Hyatt explains that the concrete used in the experiment illustrated, was a specially prepared fire resisting concrete, and not the ordinary concrete, which is not fire-proof.—*Editor California Architect.*]

Editor California Architect and Building News:

SIR:—Will you allow me to say a word on a matter just now attracting considerable attention in your region of the world?

An article under the heading "Effect of Fire on Concrete" is, I am informed going the rounds of the Western press *as news;* which I dare say it is to those who have never read a little work on "Portland Cement Concrete Combined with Iron as a Building Material," published by me seventeen years ago in England at an expense of three hundred pounds and more, and likewise distributed by me at the time gratuitously and widely among British and American architects.

The question, is Portland Cement Concrete Fire-proof? is put and answered on pages 12 and 13 of that work, with illustrations, as follows:

"Figure twenty-one represents a sample of concrete made of the best Portland Cement, moulded in brick form; made in the proportion of one cement to two crushed bricks. When one month old it was heated to redness for six hours in a furnace, and when taken out was then partially plunged into water, the end that came in contact with the fluid falling instantly to pieces and disappearing. Similar blocks heated in the same way and left to cool in the open air became disintegrated within periods varying from six to forty-eight hours; the results in all the experiments being uniform as to samples that had been exposed to the same degree of heat, and for the same length of time."

Figure twenty-two represents a similar block made from a New Portland Cement specially prepared to resist fire. This block when heated like the former was plunged bodily into water, and allowed to cool there. With the exception of some fire cracks it appeared to be perfectly sound when taken out."

The illustrations and quotations in your issue of last month in the article over the signature "Consistency" was taken from pages 19, 20 and 21 of that work; and the object of my present writing is not only with reference to the article now going the rounds of the press under the heading, "Effect of Fire on Concrete," but to also add a word of caution and explanation with respect to the quotations and illustrations given by "Consistency" from my work, lest the mistake should be made of supposing that the "slab or floor section, six feet long by two feet wide, and seven and a half inches thick," which formed "the top of the furnace" *was made of ordinary concrete.* It was not ordinary concrete, for my work explains and illustrates by figure 2, that such Portland Cement Concrete is *not* fire-proof. The fire-proof Portland Cement is shown by figure 22; and the concrete slab which formed the top of the furnace that for ten hours stood not only the "glowing red heat" but the crucial test

of the "stream of cold water thrown forcibly against the bottom of the slab for fifteen or twenty minutes" was a concrete made of my (at that time) "New Portland Cement."

THADDEUS HYATT,
73 Henry street,
May 15, 1894. Brooklyn, New York.

To the Editor of The California Architect and Building News:—

It is universally the fate of all new departures from old systems to meet with disparaging and denunciatory opposition, especially from sources that consider their corns trodden upon by the innovation. Long before and ever since the image making craft for the temple of Diana, set up the danger howl when Paul preached the Gospel in Ephesas, changes of old custom, in all departments of human interest, except in womens' dresses and bonnets, have been condemned as fraught with public danger.

After its extraordinary economical and safe use for more than fifty years, as a building material in all the countries of the world, it seems to have been lately discovered in this enterprising city of San Francisco, that Portland cement concrete is not a safe article to be applied for building purposes, especially in foundations. This discovery certainly will be news to the thousands of workmen, architects and engineers who in other places all over Europe, India and America, have employed this material in some of the largest and most important structures which have been erected in the present century, and coming from such an intelligent and influential source as a new San Francisco publication, must cause these unfortunate builders who have thus applied this unreliable composition to regret not having waited for this discovery before they ventured upon its dangerous application at the cost of the millions that have been spent upon it. Even those more ancient builders of centuries before the manufacture of this modern cement and its combinations, who used a much inferior article, if they have any consciousness and interest in their old mundane practice while yet in the spirit world where they are now supposed to be, most reproachfully regret their unadvised risk in adapting their crude conglomerations to the works that still remain as monuments of their imperfect art. Vitruvius, Michael Angelo and other old Italian and Spanish architects and engineers who made extensive use of concretes with natural but inferior cements of trass and puzzuolani, and now superceded by Portland cement, would be astonished to learn what hazards they run in this system of building, and so would be our more modern builders, Smiston, Brinley, Stevenson, Vicat, Pasley, our own countrymen, Baldwin, Col. Sylvanus Thayer and others of their date, as well as those distinguished men now living and who continue the practice, as the French Coignet and the whole of his professional contemporaries all over the world. To these experienced builders it would certainly be a queer intimation that they are guilty of using such a perilous material as concrete exposed as it is to distruction by fire and perhaps other causes as may be discovered in San Francisco.

In apprehension of the direful tendencies of concrete, now just discovered in "three lumps" of it and in a case of bad workmanship, and after the prolonged use of the material for centuries, it would be advisable on the score of humanity to notify these eminent but mistaken builders, to abandon its use and hereafter confine themselves to safer materials. It would also be an act of kindness on the part of those who have made this discovery of the inherent danger of concrete, and the means of warding off some solemn catastrophe, to warn the public, especially in the case of fire near any work wherein it was used, to keep away from it. Particular attention should be directed against such buildings as the Panthion of Rome, whose dome of more than 140 feet in diameter is composed of concrete and has stood over 2000 years, for should a fire occur under it, this unsafe piece of work might "easily crumble" and fall on somebody's head.

The writer has visited magnificent works in European cities in which concrete constituted the entire building from and inclusive of the foundation, to the roof—whole blocks of dwelling houses of six and eight stories; acqueducts of miles in length, railway bridges, monuments, lofty revetment walls and churches wholly of this material even to the surmounting spire and cross. The builders of these works evidently thought themselves well enough assured of the efficiency of the material they used and had the temerity to apply it without waiting to be informed of what might be said about its dangerous tendencies in San Francisco.

OLD CONCRETE USER.

CONCRETE AS A BUILDING MATERIAL.

AN article, said to have first appeared in a California building paper, reflecting severely upon concrete construction for foundations, etc., and as a fire-proof material, has recently been circulated gratuitously among architects and builders on this coast. While it is certainly a matter to excite comment that any reputable building journal should show a disposition to attack concrete construction at this late day, still as a matter of fact the article referred to contains nothing worthy of serious consideration. The writer, to demonstrate that cement concrete cannot be made to resist fire, states that he has taken a few pieces, subjected them to high temperature and immediately submerged them in water, after which they showed a tendency to disintegrate. He might have made the same experiment with pieces of many varieties of well known building stones with exactly tha same or similar results. The very best building stone has been affected by the instant contraction incident to sudden cooling, while the poor qualities have been practically ruined. Lyell has calculated that a mass of sandstone a mile thick raised in temperature to 1000° F. would elevate its upper surface fully fifty feet by expansion. Disintegration must follow sudden contraction. Cement concrete, like stone, is various in quality. The reputation of the best is established. It is a highly valuable building material and is used with satisfaction for foundation work and in almost every position of trust by eminent architects and engineers. Not one but scores of tests have been made of its fire-resisting qualities and the result is that it is being used to-day more than ever before. There is a field for all good materials in building and every improvement should be welcomed.—*The Pacific Builder.*

REMOVAL.—W. J. Cuthbertson has removed his office from St. Ann's building to Room 93, Flood building, corner of Market and Fourth streets, where he will be pleased to see his friends.

MAN (entering dry goods store)—"Is that gentlemen at the desk the head of the house?" CLERK—He is the man that foots the bills.—*Transcript.*

BOOKS AND PERIODICALS.

ANNUAL REPORT of the Board of Regents of the Smithsonian Institution, Washington, 1893. This report as usual contains much of interest not only to the man of science but to the general public, any one who looks at the index, can hardly fail to find some subject referred to and written in such a way as to demand attention. "The Inventors of the Telegraph and Telephone" for instance, will be read with interest by all. The illustration of the "Tibetan Prayer Mill Turned by Water" will, we think, be found more curious than useful at this day.

GOOD ROADS.—An illustrated monthly magazine published by the League of American Wheelmen, Sterling Elliott managing editor, 12 Pearl street, Boston, Mass. This magazine judging by the April number that is before us, is certainly entitled to the credit of working faithfully in the cause it has adapted, and in which all are interested. The illustrations of good roads are very enticing to the reader, and ought to urge every one to become a subscriber, as for the sum of one dollar the magazine is sent for one year.

THE MERCANTILE ADJUSTER published by the Mercantile Adjuster Publishing Co., Times Building, New York. A monthly Legal Directory and Commercial Law Digest. This must prove a very valuable manual to those wishing to have debts collected at a distance, in fact is a law library in its self that one could carry in his pocket.

RICHEY'S GUIDE AND ASSISTANT for carpenters and mechanics. A work of practical information, giving almost every geometrical and practical problem likely to arise in the work of the carpenter, and quick and easy methods for their solution. The use of the steel square, etc., tables showing strength and weight of materials, methods of framing, useful receipts, etc., etc., by H. G. Richey, illustrated by 201 engravings. Address William T. Comstock, 23 Warren street, New York, price $2.00 sent by mail free of postage to any part of the world.

This handy volume contains much information condensed into a small space, will be found useful; while nothing new in this line can be expected after so much has been written upon the subjects treated of, the author has succeeded in giving in a simple way directions that all can understand and freedom from much that often confuse the reader instead of giving him aid in understanding the subject.

DOES ADVERTISING PAY?

A book entitled "How to Get Money," published way back in the 'fifties, contains the following on advertising: "Whatever your occupation or calling may be, if it needs support from the public, advertise it thoroughly and efficiently in some shape or other that will arrest public attention. I freely confess that what success I have had in life may be attributed more to the public press than to nearly all other causes combined. There may possibly be occupations that do not require advertising, but I cannot well conceive what they are. Men in business will sometimes tell you that they have tried advertising and it did not pay. This is only when advertising is done sparingly and grudgingly. Homeopathic doses of advertising will not pay, perhaps; it is like a portion of physic, making the patient sick, but effecting nothing. Administer liberally and the cure will be permanent. Some say they cannot afford to advertise. They mistake; they cannot afford not to adverti e. In this country, where everybody reads the newspapers, it will be seen that these are the cheapest and best media through which persons can speak to the public, where they are to find their customers. Put on the appearance of business and generally the reality will follow. The farmer plants his seed, and while he is sleeping his corn and potatoes are growing. So with advertising. While you are sleeping or eating or conversing with one of your customers, your advertisement is being read by hundreds and thousands of persons who never saw you or heard of your business, and never would, had it not been for your advertisement appearing in the newspapers."—*Free Press.*

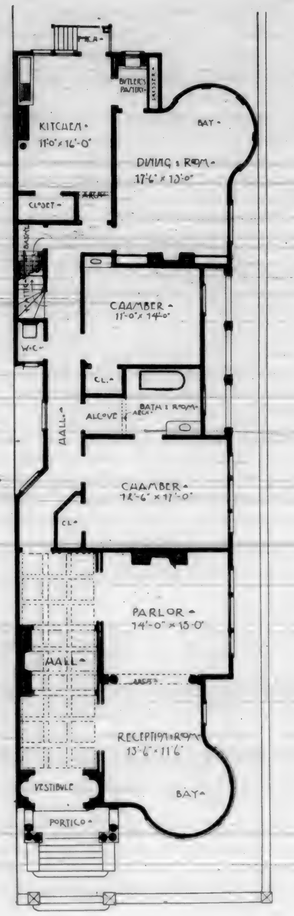
COTTAGE ON FRANKLIN STREET.

NOTICE OF MEETINGS.

San Francisco Chapter, American Institute of Architects, meets second Friday of each month at 408 California street.
Seth Babson, Pres. Geo W. Percy, Vice-Pres.
Oliver Everett, Sec. John M. Curtis, Treas.

Technical Society of the Pacific Coast, meets first Friday of each month at Academy of Sciences Building.
C. E. Grunsky, Pres. Geo. W. Dickie, Vice-Pres.
Otto Von Geldern, Sec. W. C. Ralston, Treas.

California Electrical Society, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
Geo. P. Low, Pres. C. O. Poole, Vice-Pres.
Max Caspari, Sec. H. T. Bestor, Treas.



FIRST STORY PLAN

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

Party Walls.—A party wall is a wall on the division line of estates which each proprietor is at liberty to use as a support to his building. When such a wall stands in part on the land of each it is presumed to be owned by the two, unless the contrary is shown. At the common law no person was under obligation to unite with his neighbor in building a party wall, or even to furnish his proportion of the land for it to stand upon; but an erection might be made a party wall by agreement, and if one person allowed another to make use of his wall for the support of a building, and to continue the use for twenty years, the grant of a right to do so was presumed, and the wall became a party wall by prescription. The inconveniences of the common law rule have been obviated to some extent by statutes which permit a proprietor to build into his neighbor's wall for the support of his own building, provided the wall is sufficient for the purpose, on making payment of the just proportion of the cost. These statutes establish the rule of the civil law. Where a party wall is built by agreement, the strict rule of law requires a deed, but if the agreement was by parol only, the case would be a very strong one for the application of the doctrine of equitable estoppel, and no doubt a dissatisfied proprietor would be enjoined from repudiating the arrangement and interfering with his neighbor's enjoyment of the wall as a party wall afterwards. If one erects a block of houses or shops, and then conveys them separately to purchasers, the walls between them become party walls for the mutual benefit. Where a party wall exists, each proprietor has an easement in the land of the other for its use, repair and support; but the extent of his rights may be limited by the contract between them with respect to the wall, or by the user or by the statute under which it was built or is owned. Rights in party walls pass with the land to heirs or assignees without being specially mentioned in the conveyance. Each proprietor owes to the other the duty to do nothing that shall weaken or endanger it, and though each may rightfully, when he finds it for his interest to do so, increase its height, sink the foundations deeper, or on his own side add to it, yet it seems that in doing so he is insurer against damages to the other proprietor. If the wall becomes ruinous, and ceases to answer the purposes of support, the easement is at an end, and each proprietor may build as he pleases upon his own land without any obligation to accommodate the other. 472.

Validity of Contracts.—It is no doubt the general rule of law that no right of action can spring out of an illegal contract. And the rule that an illegal contract cannot be enforced applies as well to contracts prohibited as to contracts bad in themselves. But it does not necessarily follow that all the consequences attending a contract which is contrary to public morals or founded on an immoral consideration attend and affect a contract prohibited merely. The law, in the former case, will not undertake to relieve parties from the position in which they have placed themselves, or to adjust the equities between them. But in the latter case, while the law will not enforce the prohibited contract, it will take notice of the circumstances, and, if justice and equity require a restoration of money or property received by either party there under, it will, and in many cases has given relief.

Winegard v. Fanning, Supreme Court, General Term, Third Dep't., 27 N. Y. Supp. 566. 153.

Construction of Contract for Party Wall.—Where one being about to erect a building on his lot on the west side of an adjoining lot on which the owner had a three-story building, running back 104 feet, the rear seven feet of the lot being covered with a one-story shed built for wood, on the side toward his lot, made a contract with him providing that the east wall of his building should be erected as a party wall, the cost to be borne by him, the adjoining owner to pay $3000 whenever he should make use of the party wall, and for the support of any building which he might thereafter construct. As his building came to the dividing line of the lots, it was necessary to take down the west wall, to make room for the party wall, and in doing this his building was built into and attached to the party wall. He was not liable for the $3000 till he thereafter constructed a building on his own lot, and he was not liable by reasoning of fastening his front wall into the party wall in making repairs, nor for covering over the wall on the inside of his building with plaster and wainscotting, and on this hanging gas fixtures and coat racks. Nor was the tearing down of the wooden part of the one story shed on the rear seven feet of the lot, and extending the rear brick wall of the shed, and fastening it into the party wall with cement joints, no wall being put between the shed and the party wall, the construction of a building within the contract.

Fox v. Mission School, Supreme Court of Missouri, 25 S. W. Rep. 171. 279.

Construction of Building Contract.—In a building contract, it was stipulated that, in case of the failure or unreasonable delay of the contractor to provide the necessary labor and materials to complete the work by a certain time, in the judgment of two architects named, then the other party to the contract might, after three days notice, provide other labor and materials, and complete the work. The contractor could not lawfully be stopped from proceeding with his work in constructing said buildings, upon the judgment of said architects, where the judgment of one was based solely upon what the other had informed him, and not upon his own examination of the premises and a proper inquiry into the facts constituting such default on the part of the contractor. He was entitled to the benefit of the joint judgment of the architects, based upon a full knowledge by each one of the facts which constituted such default, especially where the examination of the condition of affairs called for a personal examination of them, as a condition precedent for the exercise of the discretion and judgment of each architect.

Benson v. Miller, Supreme Court of Minnesota, 57 N. W. Rep. 943. 188.

TO ARCHITECTS AND BUILDERS.

PLEASE note that Phœnix Pure Paint has been purchased by W. P. Fuller & Co., who will continue its manufacture in connection with their own Manufacturing Department, under my personal supervision. Its high grade and absolute purity will be fully maintained. It will be my aim to make it as it always has been, the purest, best and safest paint to specify.

I thank you for your cordial support in the past, and hope to merit its continuance. Respectfully yours,

L. H. Butcher,

Formerly of The Phœnix White Lead and Color Works.

A CURIOUS QUESTION.

A curious question has come up in New York, says the *American Architect*. Mr. Elbridge T. Gerry, who is well known as a yachtsman, is having a building on Maiden Lane, belonging to his wife, painted a bright orange color. It happens that Maiden Lane is mostly occupied by jewellers, and some of these, who have windows opposite Mrs. Gerry's building, find that, when the sun falls on its orange-colored paint, the reflected rays affect the color of the white diamonds displayed in their windows, making them look yellow, and apparently, destroying a great part of their value, as a yellowish diamond is worth only a small fraction of the value of a pure white stone. The jewellers whose property is thus affected met the other day, and civilly requested Mr. Gerry to allow his building to be painted of a different color, offering to pay the whole expense themselves. This request Mr. Gerry is reported to have refused, saying that he once painted another building of his, on Broadway, of a bright red color, and that the neighbors objected, but afterwards became reconciled to it. Mr. Gerry has the reputation of being a fair-minded and amiable man, and it ought not to be necessary to point out to him that a diamond merchant, to whom it is essential to be able to judge the color of stones correctly, could hardly carry on business in a glare of orange-colored light, however it might be with clothiers on Broadway. If the buildings opposite the flame-colored front were tenanted by artists, Mr. Gerry might count with confidence on seeing them pack up their goods and move away before his decoration was even finished, and there must be some limit to the right of a man to destroy his neighbors' business by his whims. He would probably not be pleased if the jewellers, unable to carry on their own business, should sublet their buildings to copper-smiths and soap-makers, yet their right to do so would be much less questionable than his right to indulge an extraordinary freak at their expense.

BUSINESS MOSAICS.

Joseph Budde will be found to be well represented in his line of sanitary appliances; every thing relating to good plumbing, including the various new designs will be seen in this exhibit. In fact it will almost tempt one to build a house in order to be able to fix it up with such closets as are here presented to view.

If you do not go to the fair, remember the number of Mr. Budde's factory and show rooms, 575 Mission street, San Francisco, Cal.

Conductor—"No smoking allowed." Irishman—"I'm not smokin'." Conductor—"Well, you have your pipe in your mouth." Irishman—"Sure I have my feet in my shoes but I'm not walking."

As the march of improvement goes marching on, our houses which at one time we only thought a shelter from storms, now demand attention to ornamental decoration and glass staining and decoration, and glass staining and embossing works come to the front. What can be more delicate in the way of ornament than a shelf of art glass in your favorite room. Now all these wants are supplied by Mr. John Mallon's Pacific Glass Staining and Embossing Works. Call and see the endless variety that can be furnished by Mr. Mallon at 19 Fremont street and 1213 and 1215 Howard street, San Francisco, Cal.

Caller—"One of your sons is a minister and the other a physician, aren't they?" Mother (proudly)—"Yes; one preaches and the other practices."—*Detroit Free Press.*

Paraffine Paint Company are the only manufacturers of P. & B. Building Papers, Water-proof and Odorless; 500,000 square feet on the Midwinter Fair buildings were used as roofing. Anything in their line will be found at 116 Battery street where fair treatment and prompt delivery of orders make it a pleasure to do business with the firm. See their advertisement on page V in this journal.

As the merits of Fitzgerald Prepared Wall Plaster becomes known, the demand increases, nothing is a better assurance of a good thing, than the constant increase of its use; if you are in doubt where to go when you want your walls well plastered, call on the Pacific Patent Plaster Co., 216 Bush street, examine what they have to show, hear what they have to say and thus remove any doubt you may have on the subject.

Elder Sister—"Come, Clarence, take your powder like a man. You never hear me making any complaints about such a little thing as that." Clarence—"Neither would I if I could daub it on my face; it's swallerin' it that I object to."—*Life.*

The Bostwick Steel Lath Co. warns all persons from buying, selling or using the Turnbull & Cullerton Metal Lath, recently put on the market as an imitation of their old and unrivaled Lath; their notice of suit entered under their several patents covering their Lath and the machinery for making the same, and their guarantee to their customers against actions for infringements.

Penmen—"I'm getting out a book to be called 'First Aid for the Injured.' Tell me, what is the best thing to do when a bather has been in the water too long?" Old Salt—"Send for the Coroner."—*Spare Moments.*

San Francisco Novelty and Plating Works, manufacturers of artistic metal work for bank, office, show window fixtures, elevator enclosures, cages, railing, etc., we have only to enter any of the lately finished bank buildings, to notice the great strides in this stile of work that has been within a short time. Gold, silver and nickel plating is no small part of the business of this firm, as well as the supply of gas and electric fixtures. Office First and Mission streets, San Francisco.

Gold, silver and nickel plating.—Every description of metal goods plated, at the old stand of the San Francisco Plating Works, 653 and 655 Mission street. E. G. Denniston the proprietor of these works has for so many years been at the old stand, and the work he has so faithfully executed, that he needs no notice to call the attention of old friends—but as new arrivals may not be so well posted where they can have work well done, we venture to call attention to his advertisement on page iii of this journal.

Mrs. Chatter—"Do you believe that cures can be effected by the laying on of hands?" Mrs. Clatter—"Most certainly. I cured by boy of smoking in that way."—*Spare Moments.*

Dixon's Graphite Cycle Lubricant.—The Joseph Dixon Crucible Co., Jersey City, N. J., are putting a Cycle Chain Graphite on the market, which for purity of graphite and usefulness is vastly superior to anything of the kind heretofore prepared. The graphite is not only of the choicest stock, but is ground to an impalpable powder, and then reground with a high grade of lubricating oil. This material, when applied to the chain of a bicycle, penetrates the bearings and thoroughly lubricates and protects them from wear and rust.

The Dixon Company will shortly put the same material on the market in the form of a solid stick, for the convenience of wheelmen who wish to carry it in their tool bags.

"Here," said the farmer, "just split up some of that railroad timber and I'll give you a good meal." "Alas! I cannot," said the tramp; "the greater part of my life has been passed walking on such as those. It is too much like breaking up home ties."—*Puck.*

The Pacific Coast Door Co.—This is an incorporated company, office 808 Bryant street near Fifth, San Francisco, for the manufacture of doors, windows and blinds, a complete apartment of stock doors and windows, as well as sash weights and cord always on hand. Any kind of door will be made to order and estimates made for special work, T. A. Pettus, Superintendent.

We call the attention of our readers to the advertisement on the last page of this issue, of Phœnix Pure Paint. Phœnix Pure Paint has been largely used by the architects of the Pacific Coast for the last few years, and has proven itself a very meritorious article. As it is sold under a guarantee of absolute purity, architects find that where they specify it to be brought on a contract, in original unbroken packages, it saves them a great deal of trouble in watching their paint materials. Being a combination of strictly pure Lead, Zinc and Linseed Oil, it seem to be about as perfect a paint as can possibly be made. The manufacturers of this paint have demonstrated that it is possible to produce not only as good paint on the Pacific Coast as is made in the United States, but even a better article. Wherever Phœnix Pure Paint has been used it has proven itself to be of the highest possible grade, and we commend it to our readers as a perfectly safe paint.

"Er—has young Hifli come into his money yet?" "Come into it?" Great Scott, man! He's gone clear through it."—*Buffalo Currier.*

San Francisco Slate Co., rooms 4 and 5, 10th floor, Mills Building. The quarries of this company have a capacity of three thousand squares per month, are situated in El Dorado county in this state, the quality is every thing that can be desired, while the prices are the cheapest—what more can be asked for. Therefore if you want slate either for roofing or for vaults you will know where to go for a first rate article at a fair price. In our volume for 1893 you will find an illustrated article upon these slate quarries that is well worth refering to by those interested in this subject.

He—"Is that a love story you are reading?" She—"No; all the people in it are married."—*Chicago Inter-Ocean.*

The Vulcan Iron Works, 135 and 145 Fremont street, should be visited if you wish to get an idea what you can find in the way of architectural and ornamental iron works. Those about to furnish or remodel their stables should not go however, unless they wanted to be induced to order new fixtures all round as the temptation to do so will be great.

CITY BUILDING NEWS.

Belvedere near Waller. To build; owner, S. L. Strickland; architect, W. H. Lillie; contractor, F. G. Kronnick; signed, April 12; filed, April 16; cost $3100.

Broadway near Hyde. Raising and altering; owner, Ellen Roward; architect, A. L. Roward; contractor, H. Behrens; signed, April 6; filed, April 7; cost $1700.

Bush near Scott. To build; owner, Mrs. Anna C. Tietjen; architect E. Kollofrath; contractor, Wm. Louden; signed, April 14; filed, April 16; cost $3736.

Buchanan and Beach. Bulkhead and foundations; owner, S. F. Gas Co.; contractors, S. F. Bridge Co.; signed, April 25; filed, April 25.

Capp near Adair. Two flats; owner, D. B. Beaver; contractor, T. C. Cochran; signed, April 9; filed, April 9; cost $4038.

Clayton near Oak. To build; owner, J. F. English; architect, J. B. Hall; contractor, J. J. Dunn; signed, April 10; filed, April 28; cost $4900.

Clarendon Heights, Excavation; owner, Spring Valley Water Works; contractor, A. E. Buckman; signed, April 27; filed, May 3.

Connecticut and Napa. To build; owner, H. Lilienthal; contractor, H. Munster; signed, April 10; filed, May 2; cost $2325.

Dupont near Green. To build; owner, E. C. Palmetre, et al.; contractor, G. Massoletti; signed, April 18; filed, April 17; cost $3675.

Eddy near Laguna. To build; owner, Jno. Ross; architect, R. H. White; contractor, Jas. Campbell; signed, April 10; filed, April 12; cost $4,245.

Eighteenth and Shotwell. Alterations to St. Charles Church; owner, Rev. P. J. Cummins; architect, C. J. I. Devlin; contractor, Dan Powers; signed, April 14; filed, April 16; cost $4100.

Fillmore near Jackson. Mill work on two four-story frames; owner, Sarah Kahn; architect, E. A. Hermann; contractors, Pacific Coast Lumber Co.; signed, May 4; filed, May 8; cost $1642.

Fillmore near Jackson. To build; owner, Sarah Kahn; architect, E. A. Herman; contractor, M. J. Gallager; signed, April 7; filed, April 9; cost $4570.

Fillmore near Clay. A livery stable; owner, Gertrude S. Bowers; architects, Percy & Hamilton; signed, April 19; filed, April 20; cost $17,760.

Fillmore near Washington. To build; owner, Mrs. T. Meyer; contractor, G. G. Gillespie; signed, May 9; filed, May 9; cost $3000.

Filbert street. All work plumbing excepted; owner, Henry Beck; contractor, F. Hansen; signed, April 23; filed, April 23; $3200.

Filbert and Webster. To build; owner, Richard Malon; architect, W. O. Banks; contractor, Geo. H. Walker; signed, April 30; filed, May 3; cost $5700.

Florida near 22d. Foundation floors and roofing; owner, Jno. McAdams; contractor, H. P. Conrady; signed, May 1; filed, May 3; cost $2350.

Folsom near Pacific Ave. A school building; owner, P. Leo Bruener; architect, R. A. Van de Parert; contractor, R. Frost; signed, April 20; filed, April 24; cost $3,704.

Fremont near Market. Alterations, etc.; owner, H. Huntington Co.; architect, Wright & Sanders; contractors, Robenson & Gillespie; signed, April 10; filed, April 11; cost $4273.

Golden Gate near Pierce. Alterations; owner, H. Bingham; architect, R. H. White; days work; cost $4000.

Golden Gate Ave. near Baker. To build; owner, R. G. Wenzel; architect, E. J. Vogel; contractor, Robt. Currie; signed, April 14; filed, April 14; cost $3800.

Golden Gate Ave. near Octavia. Plastering; owner, Wm. John; architect, Emil John; contractor, C. Dunlap; signed, April 27; filed, May 1; cost $1150.

Golden Gate Ave. near Octavia. Plumbing; owner, Wm. John; architect, Emil John; contractor, Ickelheimer & Co.; signed, April 27; filed, May 1; cost $2783.

Golden Gate Ave. and Broderick. Raising and additions; owner, Kate Oliver; architect, T. J. Welsh; contractor, H. Jacks; signed, April 27; filed, May 2; cost $3987.

Haight near Broderick. Brick two-story frame; owner, Jas. C. Malon; architects, Shea & Shea; contractors, M. Fennell & Son; signed, April 11; filed, April 16; cost $1196.

Haight near Broderick. Plumbing; owner, Jas. C. Malon; architects, Shea & Shea; contractor, P. F. Ward; signed, April 11; filed, April 16; cost $1070.

Haight near Broderick. Carpenter work, tin and plastering; owner, Jas. C. Malon; architects, Shea & Shea; contractor, P. Griffin; signed, April 11; filed, April 16; cost $8945.

Harrison near Third. Alteration; owner, H. Goldstein; architect, W. H. Armitage; contractor, T. C. Cochran; signed, April 2; filed, April 8; cost $5100.

Howard near 11th. To build; owner, P. J. Stolz; architects, Martens & Coffey; contractor, Jno. Foster; signed, April 18; filed, April 20; cost $5700.

Kissling near 11th. Brick work; owner, Verein Eintracht; architects, Martens & Coffey; contractor, J. Magner; signed, April 16; filed, April 21; cost $1723.

Kissling near 11th. Carpenter work and iron; owner, Verein Eintracht; architects, Martens & Coffee; contractor, H. Behrens; signed, April 16; filed, April 21; cost $19,000.

Kissling near 11th. Painting; owner, Verein Eintracht; architects, Martens & Coffey; contractor, J. C. Derbsom; signed, April 16; filed, April 21; cost $1550.

Kissling near 11th. Tin and iron work; owner, Verein Eintracht; architects, Martens & Coffey; contractor, J. D. Gear; signed, April 16; filed, April 27; cost $1879.

Kissling near 11th. Plastering; owner, Verein Eintracht; architects, Martens & Coffey; contractors, H. L. Holgoth; signed, April 16; filed, April 27; cost $1945.

Kissling near 11. Plumbing, etc.; owner, Verein Eintracht; architects, Martens & Coffey; contractor, C. Rehn; signed, April 16; filed, April 27; cost $2193.

Leavenworth near Eddy. Raising and alterations; owner, Franz Acker; contractor, S. T. Crawford; signed, April 12; filed, April 12; cost $2270.

Leavenworth street. Carpenter work, plastering and painting; owner, L. A. Phelps; architects, Townsend & Wyneken; contractor, L. N. Fletcher; signed, April 16; filed, April 20; cost $2985.

Laurel Hill Cemetery. A vault; owner, Henry Williams; contractor, D. T. Pierce; cost $2600.

Liberty near Valencia. To build; owner, G. B. Clifford; architect, R. H. White; contractor, W. W. Fancher; signed, April 19; filed, April 20; cost $4000.

Lombard and Leavenworth. Alterations, etc.; owner, J. S. Hand; architect, H. D. Mitchell; contractor, M. P. Power; signed, April 20; filed, April 23; cost $1985.

Market near 6th. Brick, granite, iron work; owner, F. Gatzkow; architect, E. Kollofrath; contractors, Richardson & Gale; signed, April 17; filed, April 18; cost $27,700.

Market near 6th. Plastering; owner, F. Gutzknow; architect, E. Kollofrath; contractor, W. C. Watson; signed, April 17; filed, April 18; cost $3815.

Market near 6th. Carpenter work; owner, F. Gutzkow; architect, E. Kollofrath; contractor, Adam Miller; signed, April 17; filed, April 18; cost $30,650.

Market near 6th. Concrete to six-story brick; owner, F. Gutzkow; architect, E. Kollofrath; contractor, Geo. Goodman; signed, April 18; filed, April 18; cost $ 470.

Market near 6th. Artificial stone; owner, F. Gutzkow; architect, E. Kollofrath; contractor, Geo. Goodman; signed, April 18; filed, April 18; cost $1294.

Market near 6th. Painting; owner, F. Gutzkow; architect, E. Kollofrath; contractor, H. F. Wagner; signed, April 17; filed, April 18; cost $1400.

Market near 6th. Plumbing; owner, F. Gutzkow; architect, E. Kollofrath; contractor, R. A. Vance; signed, April 18; filed, April 19; cost $4990.

Market near 6th. Sandstone for a six-story brick; owner, F. Gutzkow; architect, E. Kollofrath; contractor, D. Kilpatrick; signed, April 28; filed, April 28; cost $7300.

Market near Post. Marble work; owner, Est. W. S. Hobarl; architects, Percy & Hamilton; contractors, Inyo Marble Co.; signed, April 25; filed, April 26; cost $11,804.

Market near Post. All heating work; owners, Ex. Est. W. S. Hobart; architects, Percy & Hamilton, contractor, W. W. Montague & Co.; signed, April 10; filed, April 13; cost $2720.

Market near Post. Plumbing; owner, Ex. Est. W. S. Hobart; architects, Percy & Hamilton; contractor, W. F. Wilson; signed, April 10; filed, April 13; cost $9765.

Market near Post. Carpenter work; owner, Ex. Est. W. S. Hobart; architects, Percy & Hamilton; contractor, R. Smille; signed, April 10; filed, April 13; cost $14,100.

Market near Post. Iron work; owner, Ex. Est. W. H. Hobart; architects, Percy & Hamilton; contractors, Dyer Bros.; signed, May 7; filed, May 9; cost $2676.

Market near Octavia. To build; owner, Mrs. Carrie Fallon; architect, E. D Govarich; contractor, Tim Williams; signed, April 9; filed, April 9; cost $7000.

Mission near 4th. To build; owner, Jos. Westall; architect, C. H. Wilson; contractor, R. Boyd; signed, April 7; filed, April 12; cost $16,500.

Minerva near Plymouth. To build; owner, Louis F. Messler; contractor, D. V. Devel; cost $1000.

Mission near Tingley; To build; owner, G. Risto; contractor, G. Ratto; signed, April 18; filed, April 19; cost $1200.

Minna near 7th. To build; Thomas Molloy and wife; architect, C. J. I. Devlin; contractor, R. Van Parent; signed, April 16; filed, April 24; cost $1995.

Montgomery street, no. 427. Alterations, etc.; owner, Emma Egan; architect, J. B. Whittemore; contractors, Brodee & Hickox; signed, April 27; filed, May 2; cost $2100.

Nineteenth and Guerrero. Carpenter work; owner, Mrs. Emma Lolar; architect, H. Geilfuss; contractors, Schutte & Krecker; signed, April 11; filed, April 12; cost $15,275.

Nineteenth and Guerrero. Painting; owner, Mrs. Emma Lolar; architect, H. Geilfuss; contractor, F. Wagner; signed, April 10; filed, April 12; cost $2223.

Nineteenth and Guerrero. Brickwork; owner, Mrs. Emma Lolar; architect, H. Geilfuss; contractor, Jas. O'Sullivan; signed, April 10; filed, April 10; cost $2333.

Nineteenth and Guerrero. Plastering; owner, Mrs. Emma Lolar; architect, H. Geilfuss; contractor, Arthur O'Brien; signed, April 10; filed, April 12; cost $2293.

Nineteenth and Guerrero. Plumbing; owner, Mrs. Emma Lolar; architect, H. Geilfuss; contractor, H. Williams; signed, April 10; filed, April 12; cost $2784.

Oak near Scott. To build; owner, Mary A. Rollins; contractor, Wm. Plant; signed, April 20; filed, April 23; cost $3310.

Pacific Ave. and Devisadero. Carpenter work; owner, C. L. Ellinwood; architects, Smith & Freeman; contractor, R. M. Murray; signed, April 10; filed, April 16; cost $13,110.

Pacific Ave. and Devisadero. Plastering; owner, C. N. Ellinwood; architects, Smith & Freeman; contractor, Alex. Mennie; signed, April 10; filed, April 16; cost $1097.

Pacific Ave. and Devisadero. Mason work; owner, C. N. Ellenwood; architects, Smith & Freeman; contractor, S. B. Cushing; signed, April 10; filed, April 16; cost $4475.

Pacific Ave. and Devisadero. Plumbing; owner, C. N. Ellinwood; architects, Smith & Freeman; contractor, R. Rice; signed, April 10; filed, April 16; cost $5183.

Pacific Ave. and Devisadero. Painting; owner, C. N. Ellinwood; architects, Smith & Freeman; contractor, W. S. Udham; signed, April 10; filed, April 16; cost $1040.

Pacific Ave. 2118. Moving and alterations; owner, Asa Wells; architect, J. N. Newsom; contractor, R. Ringrose; signed, April 15; filed, April 19; cost $1150.

Pacific Ave. near Broderick. Painting school house; owner, Board of Education; architect, C. J. Haven; contractor, C. H. Anderson; signed, April 20; filed, April 23; cost $210.

Pacific Ave. Alterations, etc.; owner, Wm. Thomas; architects, Smith & Freeman; contractors, Ingerson & Gore; signed, April 24; filed, April 24; cost $3200

Page near Lyon. To build; owner, C. Dorgeich, contractor, Jos. Kemp; signed, April 24; filed, May 1; cost $3680.

Post and Montgomery. Alterations and additions; owners, Masonic Hall Assn.; architects, Kenitzer & Barth; contractor, A. L. Sanborn; signed, May 5; filed, May 9; cost $1985.

Post near Devisadero. Cement bulkheads; owner, H. A. Rosenbaum; architect, M. J. Lyon; contractors, P. M. Ward & Co.; signed, April 6; filed, April 9; cost $1900.

Pine near Front. Brick work; owner, Kate C. Kirkham; architect, C. Geddes: contractor, G. R. Long; signed, April 6; filed, April 11; cost $2650.

Pierce and Golden Gate. To build; owner, Nellie V. Bingham; architect, R. H. White; contractors, White Bros.; signed, April 12; filed, April 14; cost $3278.

Pierce near Greenwich. To build; owner, Fred Haussler; architect, H. Geilfuss; contractor, W. H. Bush; signed, April 26; filed, April 27; cost $3290.

Seymour Ave. near Turk. To build; owner, Jacob Schmidt; architect, A. C. Lutgens; contractor, Chas. Koenig; signed, April 31; filed, May 2; cost $4125.

Sutter near Grant Ave. Alterations and additions; owner, Alice P. Sullivan; contractors, Ingerson & Gore; signed, May 6; filed, May 8; cost $2915.

Tenth Ave. and Point Lobos. Extra brick work; owner, Wm. Danrowe; architect, H. Geilfuss; contractors, Flood & Watson; signed, April 5; filed, April 7; cost $1180.

Twentieth near Capp. To build; owner, Jno Reid; contractor, J. T. Grant; signed, April 16; filed, April 27; cost $6938.

Twentieth near Guerrero. To build; owner, J. T. Adcock; contractor, Adam Miller; signed, April 10; filed, April 28; cost $4850.

Twenty-first and Alabama. To build; owner, Patrick McKaon; architect, T. J. Welsh; contractor, C. Douglass; signed, April 24; filed, April 28; cost $3725.

Twenty-second near Fulton. To build; owner, Mrs. M. Morton; architect, M. J. Welsh; contractors, Brennan Bros.; signed, April 11; filed, April 12; cost $1774.

Twenty-fourth near Folsom. Additions to house; owner, Margt. McGrath; architect, D. V. Duel; contractor, Chas. Fish; signed, April 13; filed, April 19; cost $1200.

Vulcan Lane and Vallejo. To build; owner, T. E. Pierran; architect, C. M. Rousseau; contractors, R. Doyle & Son; signed, May 9; filed, May 9; cost $8949.

Washington near Broderick. Repairs to building; owner, Mrs. C. D. McLean; architect, C. Geddes; contractor, Jas. Mix; signed, April 26; filed, April 24; cost $1485.

Webster and Germania. To build; owner, Fredrick Huber; architect, Wm. Schrof; contractor, Henry Weiss; signed, May 9; filed, May 9; cost $3930.

Zoe near Bryan. To build; owner, Timothy and Mary McAuliff; architect, T. J. Welsh; contractor, A. Fisher; signed, April? - filed, May 8; cost $2667.

NOW IN THE FIFTEENTH YEAR.

W. J. CUTHBERTSON, President. OLIVER EVERETT, Secretary.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

IN the last twenty-five years the American Institute of Architects and members of the profession who do not belong to that body, together with many others who are deeply interested, have been trying to bring about a reform in the method of designing and constructing buildings for the United States Government, but the efforts of a quarter of a century have failed, and although the Institute has labored long and earnestly, and has faithfully and persistently exerted every means of persuasion in its power, to convince Congress and the public, of the truth of its arguments, and justice of the stand the profession has taken in this matter, yet the goal is apparently no nearer than it was at the commencement of the crusade, and this unfortunate condition of affairs is the more discouraging, as success seemed at one time already certain.

But although the Honorable Secretary of the Treasury remains wedded to the present system and thinks the machine made designs turned out under his supervision, to be the best that architecture can accomplish, and all the public should require, yet the Institute has bravely resolved to again take up the fight, and convince the public and its law-makers, that the public buildings of this country should be designed by the best professional talent in the land, working under the stimulating effects of ambition and emulation, instead of by draftsmen at a nominal salary.

The following is a statement of some of the existing facts concerning this matter presented in a circular prepared by the Secretary of the American Institute of Architects, and which will be of interest to the tax-payer as well as to the patriotic citizen, who desires to think with pride, and not with shame, of the architectural monuments of his native land:

OFFICE OF THE SECRETARY OF THE AMERICAN INSTITUTE OF ARCHITECTS.

Providence, May 21, 1894.

THE ABUSES TO BE REFORMED.

1st. The needless cost of the public buildings.

2d. The needless cost of architectural service.

The authority for the figures quoted below is Mr. Glenn Brown's article in the *American Architect* of April 7th, 1894, entitled "Government Buildings Compared With Private Buildings."

Mr. Brown's statistics show the actual cost of a large number of government and private buildings, which he compares with each other, class by class.

COST OF BUILDINGS.

These statistics prove that the United States Government Buildings cost sixty-seven per cent more per cubic foot than private ones of similar construction, finish and size.

COST OF ARCHITECTURAL SERVICE.

Private "architectural service" covers the following:

Preliminary sketches, which include competitive drawings.
The final designs of every sort.
The working drawings, details and specifications.
All necessary reproductions of drawings.
All services of mechanical, sanitary, heating, electrical and constructional engineers, together with the draftsmanship, details and reports, necessary to carry out their ideas.
All paper, stationery, book-keeping, estimating and rendering of accounts, making of certificates, etc., etc.
All preliminary and final adjustments.

For the above services the regular fee is five per cent on the total cost of the building. To this should be added the sum of one per cent, estimated on the cost of the building for travelling expenses, in case there are any, and for clerk-of-the-works, both of which are usually paid for by the owners themselves.

The cost, therefore, of complete private architectural service, including the clerk-of-the-works and travelling expenses, amounts to six per cent.

Mr. Glenn Brown's statistics, taken from the actual cost of a large number of *separate structures*, shows that *the government expends* for the same architectural service, as listed above, *over nine per cent* (9 per cent).*

COMPARISONS.

Cost of architectural service, public buildings	9 per cent
Cost of architectural service, private buildings	6 per cent
Excess of cost of government over private architectural service	50 per cent

But this last comparison is made as if the government and private buildings cost the same per cubic foot, which, however, is not the case, as the government buildings cost on an average sixty-seven per cent more than private buildings. The true comparison, therefore, on a basis of the same cost per cubic foot for private and public buildings is:

Architectural service, public buildings,	15 per cent
Architectural service, private buildings	6 per cent
Excess of cost of government over private architectural service	150 per cent

NOTE.

It is stated by Actiug Secretary of the Treasury Curtis, in House of Representatives, 53d Congress, 2d Session, Ex. Doc. No. 179, which was recently sent to the speaker of the House of Representatives, that;

"It appears from the schedule of fees customarily charged by architects that the expense of preparing plans, drawings, and specifications and administration under the act might be greater than at present, but how much cannot be satisfactorily determined until a definite and detailed scheme is prepared for its development."

Does the Acting Secretary mean that the extravagant system now in vogue in the office of the Supervising Architect of the Treasury Department must be retained, and that to the total percentage must be *added*, that paid to outside architects, should they be employed to make designs? If so, one of the main purposes of any new legislation, so far as the architects are concerned, should be cut off this frightful extravagance in the office of the Supervising Architect in order that the government may have its work done at the same price that individuals pay, and by means of a service more able, expert and satisfactory.

It is this very matter of enormous expense that we are striking at.

The government can have its work done as cheaply as anyone else, provided a mandatory law be passed, insuring the employment of the expert architects of the country.*

THE ARCHITECTURAL RESULTS.

This point needs no argument:—That after spending fifty per cent more for a given building, and one hundred and fifty per cent more for full professional services than there is need of doing, and after taking from twice to ten times as long to finish the structure, the result is inferior. The government buildings obtrude themselves upon us; are inferior not only to the *best* contemporary private structures, but to the *average* ones; few, if any, are well planned, and all are more or lest offensive in appearance.

We wish to stop this great waste of the people's money, and to prevent the erection of any more structnres which shall debase public taste.

*"Civis" (Adolf Cluss, who from service in the office of the supervising architect knows whereof he affirms) in a paper on this subject printed in 1889, says that the architectural service rend red cost the Government more than 118-10 per cent.

LETTER FROM THE ACTING SECRETARY OF THE TREASURY.

* * * IN REPONSE TO HOUSE RESOLUTION ADOPTED MARCH 16, 1894, RELATIVE TO PLANS AND SPECIFICATIONS FOR PUBLIC BUILDINGS.

TREASURY DEPARTMENT, OFFICE OF THE SECRETARY,
Washington, D. C., March 31, 1894.

SIR:—In response to a resolution adopted by the House of Representatives March 16, 1894, requesting the Secretary of the Treasury to inform the House of Representatives what measures, if any, had been taken by him under the act entitled "An act authorizing the Secretary of the Treasury to obtain plans and specifications for public buildings, etc.," approved February 20, 1893, and to inform the House what, if any further legislation is in his opinion necessary to carry out the provisions of the said law, I have the honor to make the following statement:

Early in March, 1893, the subject-matter of the act in question was brought to the attention of the Secretary of the Treasury by several members of the American Institute of Architects, and at their suggestion a conference was held on the twenty-second of March, 1893, at which the provisions of the act were discussed, and some of the difficulties in the way of putting it into practical operation mentioned. Subsequent thereto certain correspondence took place between the officers of the American Institute of Architects and the Secretary of the Treasury, and also between them and the Supervising Architect, individually.

Early in January, 1894, a committee of the American Institute of Architects submitted a written protest against the sketch plans of the United States public building at Buffalo, N. Y. which had then been prepared by the Supervising Architect and approved by the Secretary of the Treasury, and two conferences in regard thereto, one on January 10th and the other on February 6th of this year, were held by the committee with the Assistant Secretary of the Treasury, having general direction and supervision of all matters relating to the public business assigned to the Supervising Architect, the Secretary being unable to met them owing to other engagements. These conferences, and the tenor of the correspondence arising therefrom, emphasized the inadequacy of the provisions of the act to accomplish the desired object, and it was then decided that the designs for the Buffalo building, which had been temporarity held in abeyance, be proceeded with, but that this should not prevent further negotiations in the endeavor to effect the intention of Congress in making the enactment. * * *

The following suggestions were made to the architects' committee:

That there was a conflict between the provisions of the present act and the provisions of certain other statutes regarding public buildings; that it was necessary to prepare a comprehensive scheme under which a competition could be arranged and a method provided for selecting a jury of award to pass upon the designs received in such competition; that the relations of the successful competitor with the Secretary of the Treasury and with the Supervising Architect's Office should be clearly established and defined by contract; that the required change in the method of preparing the plans, drawings, and specifications would necessitate a reorganization of the office of the Supervising Architect, a reduction in its force, the rearrangement of the different divisions, and the work to be performed therein; that they should examine the workings and details of the office in order to make intelligent criticisms and suggestions thereon.

The act of March 3, 1875 (sundry civil act, section providing for payments, contracts, etc., for public buildings), was neither repealed nor amended, and this requires that—

No money shall be expended upon any public building on which work has not yet been actually begun until after drawings and specifications, together with detailed estimates of the cost thereof, shall have been made by the Supervising Architect of the Treasury Department, and said plans and estimates shall have been approved by the Secretary of the Treasury, the Secretary of the Interior, and the Postmaster-General. * * *

This provision conflicts with the evident purpose of Congress expressed in the present act.

The Supervising Architect of the Treasury is the proper Government official to prepare a scheme for the competition contemplated in the act in all its various details. He has the necessary experience and acquaintance with his professional associates, and can give the time and attention required therefor. A proviso that such scheme should be approved by the Secretary of the Treasury would seem to insure the satisfaction of the public.

In the selection of a satisfactory design for a public building both practical and architectural questions are presented and any jury of award to pass upon the plans should consist, not only of architects, but also of business men or Government officials who are familiar with the practical uses and necessities of the public building under consideration at the time. A commission or jury of award consisting of five members, three of whom should be architecrs of recognized professional standing and experience, and two business men or Government officials to be appointed by the Secretary of the Treasury, and paid for their services while actually engaged in their work, is suggested.

Under the present act the successful competing architect will have the preparation of the plans, drawings and specifications, while the preparation of the proposals, the award of contracts, and the payment of all moneys are delegated to the Supervising Architect, and the latter is to perform all luties that now pertain to his office, except the preparation of drawings and specifications for the buildings and the local supervision of construction. This language fails to clearly define the duties of either. It would, therefore, seem necessary that the architect should have entire control of all the details pertaining to the construction of the building in the manner in which architects customarily control them, and the duties of the Supervising Architect be limited to a general supervision, to protect the interests of the Government during the course of construction, or that the competition should be limited to designs to be carried out by the Supervising Architect. In any event the Secretary of the Treasury should be authorized to use his discretion as to this, and directed to contract with the architect, and obtain an agreement defining strictly his duties and rights in the premises, the amount of his fees, the method to be followed during the course of construction, and to make any other provisions deemed advisable.

The office of the Supervising Architect is engaged with other work besides the construction of public buildings. It arranges for and supervises the repairs and preservation of the public buildings in the country, finished and occupied, numbering 273, the assignment of rooms therein to various officials as the needs of the public services require, the keeping a large number of records regarding the Government buildings, the proceedings regarding the obtaining of sites, the condition of the various appropriations and expenditures thereunder, and many other details. It would be necessary to retain a considerable portion of the present force of the Supervising Architect to carry out this work effectually.

It appears from the schedule of fees customarily charged by architects that the expense of preparing plans, drawings and specifications and administration under the act might be greater than at present, but how much can not be satisfactorily determined until a definite and detailed scheme is prepared for its development.

I am of the opinion, then, that in order to carry out the intention of Congress in enacting this law, it will be necessary to amend the act by substituting the following:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Secretary of the Treasury be, and is hereby, authorized, in his discretion, to obtain competitive designs or complete plans, detailed drawings, and specifications for the erection of the public buildings of the United States authorized by Congress to be erected under his supervision and direction. The Supervising Architect of the Treasury Department shall prepare a scheme for free or open competition among the architects of the United States, therefor, such scheme to be approved by the Secretary of the Treasury. That the Secretary of the Treasury shall nominate and appoint a commission or commissions, each consisting of five citizens of the United States, three of whom shall be architects of recognized professional standing and experience, and two of whom shall be men of business or Government Officials who are familiar with the uses and necessities of the public building under consideration at the time, to select the best design or complete plans from those submitted in accordance with the scheme of competition hereinbefore provided. The members of the said commissions shall be paid their actual travelling expenses and subsistence while actually engaged in the performance of their official duties.

The expenses of the commission and the fees for the services of the architect successful in said competition shall be paid from the appropriation for the building respectively passed upon or designed. In case the complete plans, detailed drawings, and specifications are furnished by competition, as herein provided, the Supervising Architect of the Treasury Department shall be the representative of the Government to inspect the erection and completion of the building, the receipt of proposals, award of contracts therefor, and the disbursement of moneys thereunder. In case designs only are supplied by competition, the Supervising Architect shall perform the duties now required of him by law, in the usual manner, excepting the preparation of such designs. That in the discretion of the Secretary of the Treasury, the architect selected as herein provided to furnish complete plans, drawings and specifications shall have the entire direction and control of the construction of said building, and the direction and control of the local superintendent of construction, and the Secretary of the Treasury is hereby authorized in all cases to make a contract with said architect for his services, providing for such erection and control, fixing his duties and responsibilities during the construction of the said building, and making proper provision for modification or change in the plans and specifications during the progress of the work, and for additions thereto; also determining the amount of his fees and charges, and including such other provisions in the contract as may, in his discretion, appear advisable to protect the interests of the Government. Any or all of the designs, or plans, detailed drawings and specifications presented in the competition herein provided may be rejected by the commission, and in case the competition fails for any cause, or it is practicable to obtain designs or plans, detailed drawings, and specifications by competition, the Secretary of the Treasury shall direct the Supervising Architect to prepare plans, drawings and specifications and supervise the construction of the building in the usual manner according to law.

All acts or parts of acts inconsistent or in conflict with this act are hereby repealed.

Respectfully yours,
W. E. CURTIS,
Acting Secretary.

THE SPEAKER OF THE HOUSE OF REPRESENTATIVES.

OUR NEW POSTOFFICE.

THE Treasury Department has been urged by Representative Maguire to commence work on the new San Francisco Postoffice, and according to a dispatch in the daily papers it is probable that early action will be taken to this end.

The new building is to be of classic architecture, comprising three stories and basement, with a square elevation over the main entrance, which is to be on Seventh street. The four corners of the elevation will consist of pillars surmounted by appropriate statues. The external plans of the building are as yet but roughly drawn, and the Supervising Architect will not permit any inspection of them or any photographs or copy to be taken until they have been perfectly finished, which will not be for three or four weeks, as the force of the Architect's office is wholly inadequate to the work now being carried on.

The completion of the floor plans of the building has been greatly delayed by the insufficiency of the force in the office. The Supervising Architect states, however, that the building when completed, according to the approved plans, will be from an artistic standpoint one of the handsomest in the United States.

The attempt of Representative Bankhead to delay the

erection of this building till he has had time to prove that the Government paid too much money for the site, is sheer folly—nobody expects or hopes that any portion of the excessive price can be recovered, and still less expects that the vendors will consent to take back their lot. This being the case, the building must perforce be built on the lot now in possession of the Government, and to delay the erection of the building now, would be only to add another blunder to the folly already consummated. As besides the advantage of giving employment to many workmen now idle the importance of having the building finished as soon as possible cannot be too strongly impressed upon the powers that be. In fact we want the use of the new Postoffice without any delay.

HOSPITAL PLANNING.

A PAPER READ BY MR. GEO. H. SANDERS BEFORE THE SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS, ON JUNE 9, 1894.

GENTLEMEN:—This paper on hospitals is merely an introduction to a series of articles taking up the subject of hospitals, past and present, in the endeavor to treat the subject tentatively by gathering up such available information as has gradually developed, along the line of adaptation of ends to purposes, from the first inception of the idea to the present time. The object will be to demonstrate the advantage of closely following up the evolution of motives in architecture, by showing that the only progress ever substantially made in art, as in science of any kind is that effected by the one only process of advancing step by step in a definite direction rather than by merely travelling in a circle or series of circles as the case may be. True it is that the real advance will be made in this way, perhaps by "natural selection" or "the survival of the fittest," or shall we not rather say as applied to architecture *progressive adaptation*, or, by whatever term is employed, *principle* is meant which is just as evident in architecture as in any other of the arts of mankind. The point I wish to make is, that by the practical recognition of this principle in the art of design, of which architecture is undoubtedly the first and chiefest, the younger element amongst us, at least, may be led to train their energies by a definite effort in one direction, instead of being led astray in a mad chase after the will-o-the-wisp of mere popularity for the time being, of some one or other, of the many beautiful forms which art has assumed in the past.

We cannot clothe ourselves either becomingly or comfortably in the cast off and worn out habiliments of our ancestors, remote or recent. All our modes of construction at the present time should be the result of past experience, wedded to new conditions, and the result would be—progress. Witness the development of the ship. From the catamaran of the Malay, to the oceanic greyhound of the present time; from the warship of the Norseman, to the modern man-of-war, a continual uninterrupted progress is visible—and what a progress! From the cave temple of the ancient Etruscan or the mighty Trilithons of Stone-Henge, to the vast cathedral of the fifteenth century, again what a progress! It is only where the latter is clothed like St. Peter's or St. Paul's in the effete forms of the architecture of the Augustan age that a step backward has been taken and with what disasterous consequences. From that day, progress in architecture has been hampered by conditions inimical to success, and we find ourselves making shorter and shorter circles, and ringing the changes by periodically reverting, not only to the erst time noble forms of Greece and Rome, but, in time debasing every beauteous creation of every age, and of every land, by absurd parodies in every style, from Romanesque to Old Colonial, and from Egyptian to Japanese, utterly regardless of adaptation of means to ends, or materials to uses, until a modern city has become little more than a mere collection of imitation architectural bric-a-brac.

True, we have the elevator, electricity and steel, together with the unknown possibilities of aluminum. What these and other modern improvements of the present day will develop in the coming century, who can say? Let us hope and strive for the *best*, and our efforts, however feeble and inefficient individually will not be wholly in vain.

Historically, there seems to be but little evidence of hospitals proper amongst the ancients. The Eastern Kahn or caravansary appears to have been the earliest form of which the hospital of modern times, with all its elaborate sanitation, muitiplication of parts and aggregation of conveniences is the heir lineal.

Plato speaks of refuges for travellers and there were Inns in the time of Christ, in one of which He was born—the first lying-in hospital on record! The Good Samaritan also is described as taking the wounded traveller to an Inn. But the Beth-Esda or "Home of Mercy" by the sheep market in Jerusalem, which consisted of five porches or sheds it may be, in which a multitude of sick folks awaited the moving of the waters (of a spring probably possessed of medicinal qualities,) is the first example we read of, describing the forerunner of a modern "springs" hotel, the sojourners at which like the Beth-Esdans of old, seek the angel of mercy in the waters of healing for the relief of their physical ailments.

But eight hundred years or more before the Christian Era, (so says Phœnecian tradition) the springs located on the site of present town of Bath in England, were resorted to from far and near on account of their curative properties, and only a few years ago, in the neighborhood of the present baths, which are still copiously supplied by the warm waters of the original spring, the remains of extensive Roman baths were uncovered, showing how that practical people had taken heedful note of the situation, and had devoted to public use the local "natural opportunity". Architectural remains of considerable magnificence were revealed. The property has been appropriated to public purposes, and the ancient basin is still brimming with the medicinal flood as of yore.

But the above is a digression; neither the Bethesda nor the springs having more than a relative significance in this connection.

Etomologically, the word "hospital" seem to have been evolved from the word "hospes", indicating "host," and is easily traced through its derivatives, "hospitalis," "hospitium," "hospitale," "hospitalia," and thence through the English "hostel," the French "hospice," "hopital" and "hotel". In the process, the last four terms seem to have served to differentiate the meaning of the word into its several designations, (1st) as a place of temporary residence, as an inn; (2nd) a temporary residence for the sick; (3d) a permanent residence for the poor and the infirm, the aged, the incurable and the insane, answering in some degree to the English

alms-house, and (4th) a term applied to dwelling houses both public and private.

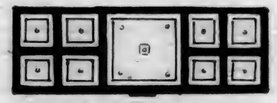
Amongst the English, the word "hospital" (adopted from the early French) and directly derived from the Latin "hospitalis" and the Italian "ospitale", frequently includes both the first and second of the above meanings. It is also commonly applied to structures specially designed for the exclusive reception of one or other of the different classes of disease, such as the blind, the insane, the deaf and dumb, etc. Whilst *infirmary* from "Infirmaria", a place set apart in monastaries for the reception of the sick, the infirm, the weak, the blind, etc., has come to be applied extensively to structures designed for the general reception of those afflicted with disease both acute and chronic.

Amongst the Greeks of the time of Pericles there seems to have been but scant provision for the care of the sick in any sense, and with the Romans, while the "valetudinarium" and a medical staff, appear to have been provided for the army there seems to be no indication of anything like a hospital for the use of the general public having been in existance.

It was not until 370 A. D. that we read of a hospital founded by Valens in Caesarea, and another, in Rome in 382-4 by a Roman lady, Fabiola by name. These were probably the first establishments on a scale sufficiently large to attract historical notice of a sentiment which must have been growing constantly under the influence of the new religion which made the welfare of the individual a matter of interest to the public, based on duty, rather than on self-advantage. In other words, these early hospitals, which were, possibly, also almshouses, must have been the final outcome of many previous attempts of a tentative character. However this may be, it is certain that the real origin of the modern hospital is to be fouud in the monasterial "infirmariva", rather than in the "hospitales" of the Romans or "Zenon" of the Greeks.

During the Middle Ages, as above remarked, the "sick" and "indigent" appear to have been tacitly relegated to the care of the various monasteries, which became, virtually, houses of entertainment, as well as the resort of people of all conditions of life throughout the civilized world. The "infirmara" and the "infirmarius" became permanent and very important constituents of every monastery and nunnery, and although there is no doubt that under the then existing conditions of society, they were a vast and almost indispensable benefit, there is plenty of evidence to show that many evils had their origin in these institutions as well. This arose from the absorption of the Infirmary into the beneficies of the Clergy, with the easily understood result of inefficiency and malfeasance in the conduct of these departments, so that many regulations had to be issued by the Roman Pontiff, restraining and forbidding the wrong practices which had arisen.

The best example known of an infirmary of the Middle Ages, is that of the projected plan of the great Monastery of St. Gall (9th Century) in which the wards apparantly for

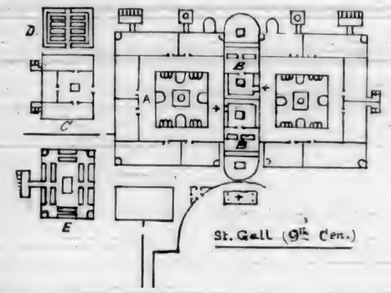


OSPITALE GRANDE MILAN (DIAG.)

both sexes are seen arranged around a cloistered court or garden on one side of a double Chapel. There is also a doctor's residence, a garden for medicinal herbs and "simples", a dispensary and other details of arrangement so complete and well understood that it is evident the whole was the result of system and practice, no longer in the experimental stage.

The first regular hospitals erected for the purpose in England, were those founded by Lanfranc, Archbishop of Canterbury, in London, A. D. 1080; one for leprosy and one for ordinary diseases.

Amongst the many notable hospitals of the world, perhaps the most noted of them all, is the "Ospidale Grande" in Milan, Italy, begun in 1456 and completed in 1621. It is certainly one of the grandest, if not the very grandest, building of the time, built for such a purpose, during the whole period preceding the great hospital-building epoch of the eighteenth century, and still holds its own, not only in regard to beauty an appropriateness of design, but also on account of climatic adaption to the purpose for which it is intended. It consists of an immense garden court adorned with fountains, and blooming with flowers, the court is 340 feet square with a block about equally large at each end,



divided into four smaller courts, each and all, surrounded internally by two story cloisters or arcades on to which the wards open, thus affording cool shade in the brilliant Italian atmosphere, as well as shelter in all weathers for those who are able to move about. Of course the general arrangement of the wards round courts is not that of a modern hospital, and there is no doubt but that the pavilion plan is much superior to any connected system of wards or series of wards such as that employed in the Ospitale Grande, nevertheless, for the time in which it was erected and with the experience and conditions such as those then existing in Italy, the structure presents fewer defects than under the circumstances would be expected. It was, however, during the eighteenth century above alluded to, that the hospital became as did the cathedral of the thirteenth century, the special object of attention in the civilized countries of the world. In Great Britain and Ireland alone, upward of fifty of these great structures were erected, and in every country of Europe the same activity in this direction was observable. The evolution of the hospital idea, as in future papers will be seen, has served to develop as before mentioned, the special characteristics of these structures in a remarkable manner, but this must be left for consideration in our next paper.

M. S. James the Pacific Coast Agent of The J. L. Mott Iron Works has removed his office from Room 46 Flood Building to Room 35 in the same building.

PORTLAND CEMENT IN THE CITY WATER WORKS OF PORTLAND OREGON.

THE Engineer in charge of the City Water Works of Portland, Oregon, furnished the following report to a committee of one hundred representing the tax-payers of that city, in refutation of charges that had been made of favoritism in the awarding of the contract for furnishing the cement to be used in the work.

Those interested in the use of cement and concrete will be interested in the table of comparative tests contained in the report which follows:

ENGINEER SMITH'S RECOMMENDATION.

It was finally agreed to read the communication of Engineer Smith, with the accompanying extracts from minutes of the board and exhibits pertaining to the analysis of the different kinds of cement. The letter is as follows:

OFFICE OF THE CITY WATER WORKS,
PORTLAND, OR., MAY 11, 1894.

H. W. CORBETT, ESQ., PORTLAND, OR.—*Dear Sir:* I enclose herewith a transcript, prepared by Mr. Dodge, of all proceedings of the water committee in relation to the cement contracts; also specifications on which proposals were made, and a copy of the reports of the engineers on the tests made in accordance with the specifications.

According to the specifications, it was necessary that the cement should conform to the requirements stated in article 8, in relation to fineness, time of setting after mixture, tensile strength, etc.

The result of the tests for fineness and time of setting is shown in the following table, from reports of the engineers:

PROPOSAL TO FURNISH 15,000 BARRELS CEMENT.

Brand	Price bid per bbl.	Per cent of residue on sieve of 5800 meshes per square inch	Cost per bbl. of available cement after rejecting on sieve of 5800 meshes per square inch	Time of setting minutes
Josson	$2 50	4 05	$2 60.52	75
North	2 50	5 00	2 63.15	42
Whites	2 45	8 54	2 67.88	42
K. B. S.	2 40	10 70	2 68.78	20
Gresham	2 40	12 70	2 74.91	25
Gillingham (Extra)	2 60	6 16	2 77.07	22

The residue of the cement remaining in the screens after testing is of no greater value than so much sand, as was shown by specimens presented to the committee.

The bid on the Josson cement was $2.50 per barrel, but as it contained 4.05 per cent of refuse, the cost per barrel of the pure cement was $2.60.

The bid on the Gresham cement (from George Pope & Co.) was $2.40 per barrel, but as it contained 12.70 per cent of refuse, the cost of the pure cement was $2.74 per barrel.

From this test it appears not only that the cements offered by Taylor, Young & Co. were the cheapest, but that they were the only ones coming up to the requirements of the specifications in relation to fineness.

When cement sets before being used it is of no value, and therefore it was stated in the specifications that all cement setting within thirty minutes after being mixed would be rejected.

In this respect also the cements offered by Taylor, Young & Co. were the only ones coming up to requirements of the specifications.

For these reasons all bids were rejected, except those of Taylor, Young & Co. and Meyer, Wilson & Co., and the engineers were directed to make further tests for tensile strength at intervals of three, seven and twenty-eight days.

After making these tests the engineers reported that the Josson brand was superior to all the others in cost, fineness and strength.

The reason for letting a contract for 30,000 barrels, instead of the 15,000 barrels called for, are stated in the following extract from the report of the engineer:

"When I first called for 15,000 barrels, I understood that there were 45,000 to 50,000 barrels of standard brands of cement in the city, all of which I supposed would be available, and I mentioned 15,000 barrels as a quantity desirable to start on the works, and sufficient to contract for at once, presuming that the remaining amount could be had at any time during the year; but after making our tests it developed that the Josson was the only brand that fulfilled all our requirements, and in order to get what we need of that this year, it was necessary to order more immediately. There is no time to wait and advertise for more bids, and there would be no use doing so if we stick to our specifications."

For making the tests a new Fairbanks cement-testing machine, borrowed from Mr. McCraken, was used, and all bidders were invited to be present at the testing of the different brands.

The tests were all made in the same room, with the same proportion of water, and under like conditions.

Mr. Graves, the representative of Messrs. George Pope & Co., was frequently present when the tests were made, and expressed himself as being perfectly satisfied with the results. The same gentlemen brought to the office several briquettes, which he said had been made by Mr. Pope, and they were tested at his request.

Mr. London for Balfour, Guthrie & Co., also had the mixtures made in accordance with instructions from the English makers, and was present when the tests were made.

Mr. McCraken was also present at some of the tests which were made with his own machine, and so far as I know, expressed no dissatisfaction at the results.

All the tests have been registered and can be inspected, although they were not furnished for publication.

The tests all show, not that the rejected brands are of a bad quality, but that in respect of strength, time of setting, fineness and cost, the Josson brand was the best of all.

Respectfully yours,
ISAAC W. SMITH,
ENGINEER OF THE WATER COMMITTEE.

NOTE—The bid of Corbitt & Macleay for 11,500 barrels was not in accordance with the specifications, which called for 15,000 barrels, but it would have been accepted if the engineers had not reported that after making the tests it proved to be deficient in strength.—*The Sunday Oregonian. Portland, May 13, 1894.*

INGENUITY IN SHINGLING.

THE Ferguson Cedar Shingle Company, at Latona, have hit upon a happy idea to save the transportation of waste material from the woods to their mill by removing their "cut off" saw and "knee bolter" to a point on the Seattle, Lake Shore and Eastern road where it crosses the Pillchuck creek. There the company have put in a boom and established a camp. The bolts are taken from the water and sawed and trimmed ready for the shingle saw. By means of an endless belt they are loaded upon cars especially prepared to receive and transport them to their mill at Latona. The saving in transportation is estimated at one-third and saves the necessity of maintaining a fire to consume the waste, thereby lessening the danger from fire. The change has also enabled them to increase their daily output from 90,000 to 120,000 per day.—*Seattle Intelligence.*

CLINTON DAY, ARCHITECT.

THE MONTHLY MEETING OF THE SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

AT the monthly meeting of the San Francisco Chapter of the American Institute of Architects held in their rooms Friday June 8th, the Exhibitation Committee reported a very favorable exhibit of architectural drawings at the Art Institute. The application of Architect M. J. Lyon for application for fellow membership, was favorably reported by the executive committee, and will be balloted on at the next meeting.

The paper on "Hospital Planning," read by Mr. Geo. H. Sanders, will be found in another column of this number.

PELE, THE HAWAIIAN GODDESS OF FIRE.

THE traditions say that she was the most beautiful woman that ever lived, and the most capricious. She made her home on various islands from which she was successively driven by the Water God "Kamapuaa," who had the body of a man and the head of a hog. She finally took refuge in the Volcano of Kilauea, where she maintains herself to this day. Whenever her wrath was excited she would turn into a lava flow or throw masses of hot rocks and overwhelm her enemies.

PELE, THE HAWAIIAN GODDESS OF FIRE.

POLITENESS is the result of good sense and good nature.

BOOKS AND PERIODICALS.

YELLOWSTONE NATIONAL PARK—An illustrated pamphlet giving information about Yellowstone Park and the Northern Pacific Railroad is well worthy of mention; this brochure in the way of a guide to the northwest will well repay a careful study. Seldom do we find so much information about what may be seen upon a journey placed before the reader in such a charming manner.

The illustrations are not only well executed and printed, but give a delightful insight into a comparatively unknown region; already it requires two steamers to accommodate the travel of this line upon Puget Sound to Alaska, thus proving it will not remain an unknown region much longer.

For six cents in postage stamps the agent of this line will send a copy of "Indianland and Wonderland" giving a detailed account of routes, price of fare, etc.

THE FORTNIGHTLY REVIEW for May contains among other interesting articles one upon the "Appreciation of Gold" by Robert Barclay, Director of the Manchester Chamber of Commerce. This timely article is well worthy the serious consideration of every one, and is certainly very encouraging that the evils of a single gold standard of value is beginning to open the eyes of the English people to the fact that the maintenance of a single standard is likely to re-act upon the English people in a way not favorable to either their commerce or manufacturers, thus inducing them to urge the Government to take steps to restore the use of both gold and silver to the currency of the world; without the aid of England the desirable object cannot be obtained.

LIPPINCOTT'S Monthly Magazine for June as usual is full of good things "The Wonder Witch" by M. G. McClelland is the complete novel, while the last installment of the "Tresspassor" by Gilbert Parker finishes what may be called a sentimental story that we are glad to see the last of; "My First Library Acquaintance" by R. H. Stoddard will call to the recollection of old timers the New World with its motto

"No pent up utica contracts our powers
The whole boundless continent is ours."

A SUBURBAN COTTAGE FOR TWO SMALL FAMILIES.

ORNAMENTAL IRON—A monthly journal devoted to industrial art. The April and May furnishing a double number and completing the first volume gives us a good opportunity to review the good work done and the many excellent specimens of ornamental iron work presented in this volume, this style of metal work so essential to modern commercial use and public buildings has come among us to stay; it is therefore important to have at hand a standard authority on the subject and certainly the Winslow Bros. Co., 759 The Rookery, Chicago, have furnished exactly what was wanted. Architects will do well to see that this very clever magazine is always at hand and often refered to.

"How did Algy get so frightfully burned?"

"He was warming before the grate, just after a bath, when his clothes caught fire."

"Didn't he jump back into the bath tub?"

"No. He ran out on the fire escape."—*Life.*

PLAN OF SUBURBAN COTTAGE FOR TWO SMALL FAMILIES.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

RIGHT OF REDEMPTION BY JUDGMENT CREDITOR.—A mortgagee who has obtained a degree of foreclosure is a "decree creditor," within the meaning of the statutes, which declares that "any decree or judgment creditor" may redeem from an execution or foreclosure sale after twelve and within fifteen months from the sale.

Whitehead v. Hall, Supreme Court of Illinois, 35 N. E. Rep. 871. 50.

LIABILITY OF AGENT FOR UNDISCLOSED PRINCIPAL.—An agent who fails to disclose his principal is personally liable to a person with whom he contracts, though such person might have discovered the agency; actual knowledge being necessary to relieve the agent of liability.

Mahoney v. Kent, Common Pleas of New York City and County, General Term, 28 N. Y. Supp. Rep. 19. 42.

LIABILITY OF CORPORATION FOR ACTS OF PROMOTOR.—A promotor is not an agent, for agency implies the exercise of a principal, and a delegation of authority from the principal to the agent. Therefore a corporation is not responsible for acts performed or contracts entered into by a promotor before it came into existence. But a corporation may, however, make itself responsible for such acts and representations by adoption. The adoption of an agreement made by a promotor of a corporation may be implied from the acts of acquiescence of the corporation without any express acceptance. After a corporation has knowingly received the benefits of an arrangement or understanding entered into by its promoters, it will not be permitted to deny that it did not agree to it.

Huron Printing & Bindery Co. v. Kittlesome, Supreme Court of South Dakota, 57 N. W. Rep. 235. 78.

BREACH OF CONTRACT TO REPAIR.—Where a lessor agreed to put in a new furnace, but there was no stipulation as to the amount of heat that it should give, and it failed to give out heat according to its capacity because of a defect in the pipe connections. Failure of the landlord to remedy such defect which could have been done at a small expense, was not an eviction, as the lessee could have done it, and set off the cost against the rent.

Doolittle v. Selkirk, Common Pleas of New York City and County, General Term, 28 N. Y. Supp. Rep. 43. 85.

LIABILITY FOR DEFECTIVE APPLIANCES.—The owner of a building is not liable for injuries to one of the workman employed thereon, caused by the breaking of the joist, in consequence of an obvious defect, where the person injured was an experienced carpenter, and assisted in placing the defective joist.

Griffiths v. New Jersey & N. Y. R. Co., Superior Court of New York City, General Term, 28 N. Y. Supp. Rep. 75. 49.

LIABILITIES OF OWNER FOR MATERIAL FURNISHED CONTRACTOR.—A personal judgment cannot be obtained against the owner of a building for material furnished the contractor on his own account, if the owner had no knowledge of the purchase of the material by the contractor.

May & Thomas Hardware Co. v. McConnell, Supreme Court of Alabama, 14 S. Rep. 768. 43.

INTERPRETATION OF CONTRACTS.—Where a building contract provides that the contractor shall receive as compensation the cost of material and labor used in the building, "and ten per cent, added thereto as profit," the accounts paid by the contractor on sub-contracts for various portions of the work, including the customary profit of the sub-contractors, will be considered as "the cost of labor and material," in estimating the amount due to the contractor.

Hamilton v. Coogan, Common Pleas of New York City and County, General Term, 28 N. Y. Supp. Rep. 21. 73.

COUNTY PROPERTY EXEMPT FROM MECHANICS' LIENS.—The public buildings of a county are wholly exempt from the operations of the mechanics' lien law, and cannot be sold under execution or other process. The county court of a county cannot be compelled by a bill in chancery to issue an order against the county funds for any debt or claim, just or unjust, against the county. The by a statutory law furnishes the remedy in all such cases, and it must be strickly pursued.

Hall's Safe & Lock Company v. Scites, Supreme Court of Appeals of West Virginia, 18 S. E. Rep. 895. 80.

WASHINGTON ARCHITECTS ORGANIZE.

ON the afternoon of May 10th, a meeting of architects of Tacoma and Seattle was held in the city hall council chambers of Tacoma. The object was the formation of an organization of architects with the final object of becoming a Chapter of the American Institute. The meeting was composed of eight members from Seattle together with eight architects of this city, making sixteen who signed the constitution and by-laws. It is proposed to hold a meeting at Spokane a little later to interest the architects in that city and give them an opportunity to join. The Tacoma members are as follows: G. W. Bullard, Wm. Farrell, Albert Sutton, A. L. Robinson, Louis Mendell, L. C. Houser, A. J. Russell and C. B. Talbot. The Seattle members are: Messrs. Boone, Wilcox, Saunders, Chas. H. Bebb, James Stevens, Albert Wickersham, G. H. Parks and Emil De Neuf. The officers are: President, W. E. Boone of Seattle; First Vice-President, W. H. Wilcox of Seattle; Second Vice-President, G. W. Bullard of Tacoma; Secretary, C. W. Sanders of Seattle. At the meeting in this city an interesting paper was read by architect G. W. Bullard on the subject of "Architects as Pioneers." President Boone's opening addressed was listened to with interest. A condensed report of it is as follows:

"For some time past the architects of this state have, in a desultory and unsystematic way, been debating with one another the advisability of establishing a chapter of architects which should bring together and organize all the worthy members of the craft within the boundaries of Washington. The necessity for such an organization was admitted by everybody. Its absence was deplored by all who desired to preserved in their integrity, on this virgin soil, the honorable traditions and gentlemenly practices of the profession. As a check and deterring restraint upon the greedy and unscrupulous, it was rightly held that an organization would be not less beneficial to the great body of upright architects than to the entire community. It was also strongly desired that we should take the necessary steps for admission to that important body, the American Institute of Architects, whose influence upon American architecture has already become most extensive and beneficial. Firmly impressed with the very great importance of organization, the architects of the city of Seattle resolved to take some practical measure for the establishment of a chapter of architects in this state. What form this measure should assume was the first matter for decision. It was deemed better to create a chapter out of the material at hand, and then solicit the cordial co-operation of the entire profession in the state making it really and truly what it is already in name—the Washington Chapter of Architects. We accordingly organized this chapter by the adoption of a constitution and by-laws and the election of officers; and we are now before you, gentlemen of Tacoma, for your approval and co-operation, of which, indeed, we have never entertained a doubt. Your brethren in Seattle claim no primacy, pre-eminence or privileges in the chapter. The work which they submit to you is provisional only, and they expect it to be amended, improved and strengthened by your zeal, intelligence, wisdom and experience. Their hope and wish is, that after you have subscribed the by-laws and thus become members of the chapter, a meeting of the chapter be held, as early as possible, in the city of Spokane, to afford our brethern there an opportunity of joining hands with us. With Seattle, Taeoma and Spokane thus enrolled under the banner of the chapter, we can arrange for further meetings in the large towns of the state, so as to enable all the reputable and honorable architects of Washington to affiliate with us. When the organization is thus perfected, with every part of the state represented, the permanent home of the chapter can be fairly and satisfactorily located. Within the past decade no part of the United States has done more building relatively than Washington. Much of it has been of a highly important character, and still more important work is to be done in the near future. It behooves the profession to exert all its influence in the most systematic and effective manner for the establishment and maintenance of a high standard of professional ethics, architectural skill, and solidity of construction. The public judge us favorably or unfavorably in proportion as we erect and aim for our own guidance and control a high or low standard and rule of action in these transcendently important respects."—*The Pacific Builder.*

A SUMMER HOTEL IN THE ATLANTIC OCEAN.

FROM *The New York World*, we learn of the proposition to build a summer hotel in the Atlantic Ocean.

The exact spot in the ocean where the buildings will be erected is not made public. Mr. Coen said yesterday that it had been selected and the soundings had been made and the exact location marked by buoys. It is off the Long Island coast, probable somewhere between Fire Island and New York, and it will be fourteen miles from the shore. Atalantis, as it is to be called, will not be built upon a sand-bar. It will not even be built over shoal water. Now, at the first thought it seems ridiculous that any structure could be made strong enough to resist the power of the waves of the ocean in a storm, but Mr. Coen says the engineers have declared that the scheme is feasible.

The chief engineer is Captain R. D. Evans of the United States Navy, who is practically at the head of the Light-House Board. He is recognized both in this country and abroad as one of the ablest of engineers in deep-sea construction and has a very high reputation in Government circles. Associated with him is J. C. McGuire, who has charge of the steel construction in Government buildings, and who is just now in charge of the new Appraiser's stores building in West street. Captain Howard Patterson, formerly of the United States Navy, formerly Professor of Naval Science in Brown's College, and who was admiral of the Haytian navy, is another of the engineers.

The engineers, it is said, have agreed to put down the foundations under a forfeit of $1,000,000. This convinced those who hesitated about putting money into the scheme. The structure will rest upon cylinders. Atlantis will include a number of structures, of which but one will be built this year. It will be a great pavilion, constructed in the form of a square, two stories high in the main and three in the towers, and will rest upon large iron cylinders, filled and sunk in Portland cement.

The main floor will be thirty feet above the water, and the Roman order of architecture will predominate.

The edifice will be built entirely of steel, iron, glass and tiles, thus making it entirely fire-proof. Within will be a grand amphitheatre. It is calculated that the lower floor will accommodate 10,000 people, while the gallery will hold 7,000 more. There is also provision for a spacious esplanade or roof garden, seating 3,000. There will be 120 large rooms for hotel accommodation, a cafe, restaurant, billiard-room and all accessories of that sort. Then there is the anglers' pavilion, which ought to increase the popularity, because the structure will be located in the midst of the fishing grounds.

The promoters of the enterprise say that it offers all the advantages of a sea voyage without the discomforts of sea-sickness. It is promised that it will be within two hours sail of this city.

Mr. Coen expects that the building will be opened before the summer is over.

BUSINESS MOSAICS.

The San Francisco Repository of Studebaker Bros., is located at the corner of Market and Tenth streets, and is one of the finest and most extensive carriage repositories in America, or, for that matter, in Europe; it has a 90-foot frontage on Market street and 145-foot frontage on Tenth street, has five floors the full size of the building devoted to salesrooms for Carriages, Buggies, Carts, Spring, Farm and Team Wagons, also Harness of every kind and price, Robes, Blankets, Whips and Stable Supplies. In addition to their repository they have extensive warehouses near the depots on the railroad tracts, having 75-foot frontage and running through an entire block. Vehicles are shipped from their factories in their own cars and never break bulk until unloaded at their warehouses. Almost any kind of vehicle or harness known to the trade can be had at the San Francisco Repository of Studebaker Bros. Mfg. Co.

Mr. E. E. Ames, well known as one of our leading and prominent citizens, has been manager of the San Francisco Branch for over twenty years. With the Studebaker Wagons and Carriages he has built up the most extensive business of any house on the Pacific Coast.

She—"Cease your flattery, sir, or I shall put my hands over my ears." He (wishing to pay her a compliment)—Impossible! your hands are too small for that."—*Le Petit.*

The McMillan Sash Balance and Lock is an article which commands the attention of every one interested in having a reliable and perfect attachment that will allow you to easily work the window without fear of breaking the sash cord or slamming of windows and at the same time feel secure that the windows are fastened when ventilation is desired. Advantages claimed for the McMillan Sash Balance and Lock, are that you can take out the sash to clean the glass by locking and throwing back the left wheel (when two locks are used) and taking off left hand strip. You can lock either sash at any point, open any distance, to ventilate, or

SASH BALANCE.

BEAD FASTENER.

tightly shut together. It will not allow the sash to rattle with the wind. It balances the sash perfectly by a coiled flat spring inside the wheel. It cannot be picked as there is no way to reach it from the outside. It cannot be broken by any pry placed under the sash, as other locks can.

It can be put into old houses as well as new, and at a very small cost for labor. No boxing necessary, therefore no place left through which cold air can rush in as in the case with ropes and weights. For durability it surpasses anything in the sash balance line, being made of best metal and sheet steel. The rack in sash is made of sheet steel and will last as long as the house stands.

The balance is hidden, therefore no cords or ribbons are exposed to view. The balance is made to carry windows from three to five hundred pounds. The World's Fair Medal was awarded by the Columbian Exposition, Chicago.

The Common Sense Bead Fastener is also an indispensable attachment where it is desired to remove the windows at any time without injuring window casing or stop bead.

Smith & Young of San Francisco and Los Angeles are General Agents for the McMillan Sash Balance and Lock combined as well as the Common Sense Bead Fastener and on application will send price list and other information relative to the same.

She—"I beg your pardon, monsieur, for having trodden on your toe." He—"Don't mention it, mam'selle; it is I who ask pardon for having a toe."—*Tid-Bits.*

If you are about to paint your house and want it well done, you must use good materials, do this and you will not be troubled with cracks and blisters and all the evils that follow when poor materials are used; this being granted all you have to do to obtain what you desire in this line is to call upon W. P. Fuller & Co. manufacturers of Phoenix Pure Paint, this article is made of white lead, zinc, oxide and linseed oil, thoroughly mixed by heavy machinery and is sure to give satisfaction to all concerned.

Their new wall finish is a splendid thing for the good housewife, as it is claimed to be a washable water color that petrifies on the wall and will not crack or chip off. What more can be asked of a wall finish?

Bradford—"Binks and his wife make a good match." Robinson—"Yes; he's a stick and she the brimstone."—*Harlem Life.*

We furnish with this issue a half-tone of Edw. B. Hindes & Co's. beautiful exhibit, located in the SE corner gallery of the Manufactures and Liberal Arts building. On entering, to the left is shown their Rolling Wood Partitions for Churches, Sunday School Rooms, etc.; next a Self Coiling Noiseless, Burglar and Fire-proof Corrugated Steel Shutter.

The next opening contains one of the Modern Venetian Blinds, of which they are the only manufacturers on the Pacific Coast. The next two windows are devoted to their justly celebrated Hill's Patent Inside Sliding Blinds, in Hard Woods and White Cedar. The last window to the right shows the Hill Patent Sliding Fly Screen, acknowledged to be the most perfect screen in use, covering either top or bottom sash and can be instantly removed to clean windows or when not needed. The architecture and finish of this exhibit is conceded to be among the finest making it one of the most attractive features of the Midwinter Fair.

The main office and factory of this firm is at 411 Mission street, San Francisco.

Farmer Squashead (observing a metropolitan daily on the counter of the village store)—"What! Aint that air paper busted up yet? Why, I quit taking it fifteen years ago."—*Time.*

Union Pressed Brick and Terra Cotta Co.—We cannot find the space in these pages for an enumeration of the various kinds of pressed, moulded and ornamental brick to say nothing of the varieties of Architectural Terra Cotta and fire-proofing, paving tile, etc., but if you send for a catalogue to their main office, SE corner Bush and Sansome streets you can find out all about it.

CITY BUILDING NEWS.

Army near Folsom. To build; owner, P. Leo Bruener; architect, R. A. Van de Pavert; contractor, Robert Trast; signed, May 23; filed, May 24; cost $23,350.

Baker near Bush. To build; owner, T. Randall; architect, R. H. White; day work; cost $500.

Baker near Bush. Painting; owner, T. Randall; architect, R. H. White; contractor, J. F. Sullivan; cost $530.

Broderick near Fulton. To build; owner, Henry Dederky, Jr.; architect, Chas. M. Rousseau; contractor, Philip Rive; signed, May 22; filed, May 23; cost $2950.

Buchanan and Sacramento. Carpenter work; owner, M. Hyman; architects, Percy & Hamilton; contractor, T. M. McLachlan; signed, May 24; filed, May 28; cost $14,909.

California near Jones. Interior finish, stairs, hardware and glazing; owner, George Whittell; architects, Townsend & Wyneken; contractors, W. T. Geitch & Bros.; signed, May 14; filed, May 22; cost $8500.

California near Laguna. To build; owner, R. J. Wilson; architect, Walter J. Mathews; contractor, H. E. Jones; signed, May 23; filed, May 28; cost $13,470.

California near Laguna. Stone work; owner, R. J. Wilson; architect, Walter J. Mathews; contractors, Sutton & Johnson; signed, May 26; filed, May 28; cost $2500.

City Hall Ave. Excavation and concrete work on City Hall; owner, Frank Happersberger; architect, Clinton Day; contractor, Thos. E. Keough; signed, May 26; filed, May 26; cost $1050.

Day near Church. To build; owner, Wm. Edwards; contractors, A. Hanson & J. Sandeen; signed, May 19; filed, May 19; cost $1675.

Denver near Falcon. To build; owner, John Fles; architect, J. T. Kidd; contractors, Hood & Watson; signed, May 9; filed, May 12; cost $2700.

Diamond and Collingswood. To build; owner, Frank A. Meyers; contractor, H. R. Abrahamson; signed, April 14; filed, April 19; cost $1565.

Eight Ave. near Clement. Frame cottage; owners, Marshall Newman and wife; architects, Kenitzer & Barth; contractors, Peterson & Olson; signed, May 19; filed, May 19; cost $1350.

Eleventh Ave. near J. To build; owners, W. H. and Kate Jones; contractor, G. Larson; signed, May 7; filed, May 22; cost $1433.

Fell near Scott. To build; owner, C. J. Kaighin; contractors, Pattersen & Person; signed, May 17; filed, May 18; cost $5500.

Folsom near 25th. To build; owner, Mary Sparks; architect, John T. Hogan; contractor, James A. McDonald; signed, May 18; filed, May 21; cost $2400.

Folsom bet. 3d and 4th. Raising and moving; owner, T. J. Hund; architects, De Ross & Co.; contractor, F. V. Steirman; signed, May 14; filed, May 16; cost $3585.

Fifteenth near Noe. To build; owner, Delia Ryan; architect, T. J. Welsh; contractor, A. Hawkins; signed, May 10; filed, May 12; cost $3500.

Fulton near Lyon. To build; owner, James Reaxey; architect, E. A. Hermann; contractors, Peterson & Olson; signed, May 22; filed, May 23; cost $1600.

Fulton near Devisadero. To build; owner, Moses A. Epshraim; contractor, W. W. Rednall; signed, May 25; filed, May 25; cost $1450.

Golden Gate Ave. near Devisadero. To build; owner, John Traynor; architects, Lauer & Mullany; contractor, James Cochran; cost $5250.

Harrison near Fourth. To paint Whittier School; owner, Board of Education; architect, Chas. I. Havens; contractors, The Painters Protective League of S. F.; signed, May 24; filed, May 26; cost $1200.

Hayes near Polk. To build and alterations to one-story building; owner, Rose V. Jessop; architect, R. H. White; contractor, John Furness; signed, May 19; filed, May 22; cost $7800.

Howard near 17th. Alterations and additions; owners, J. L. Fallon and Della Fallon; architect, Chas. J. I. Devlin; contractor, Jas. J. O'Brien; signed, May 19; filed, May 19; cost $2190.

Hyde near Bush. Carpenter work to six flats; owner, Samuel Foster; architects, Smith & Freeman; contractor, S. H. Kent; signed, May 17; filed, May 26; cost $14,446.

Hyde near Bush. Plumbing; owner, Samuel Foster; architects, Smith & Freeman; contractors, Shepard Bros.; signed, May 17; filed, May 26; cost $2976.

Market near 5th. Plumbing, etc.; owner, Emma Spreckles; architects, Reid Bros.; contractor, W. F. Wilson; signed, May 8; filed, May 26; cost $20,250.

Market near 5th. Certain branches of work; owner, Emma Spreckles; architects, Reid Bros.; contractors, G. Dillon and J. W. Hansbrough; cost $41,744.

Market near 5th. Lathing and plastering; owner, Emma Spreckles; architects, Reid Bros.; contractor, Thos. Mannix; cost $5920.

Market near 5th. Store front; owner, Emma Spreckles; architects, Reid Bros; contractor, D. McPhee; cost $13,200.

Mason and California. Mark Hopkins Institute of Art, to paint, tint and burn off old paint; owner, S. F. Art Assn.; contractor, P. N. Kuss; signed, May 21; filed, May 22; cost $1400.

Oak near Webster. Plumbing; owner, Edmund Schuntenbaus; architects, Salfield & Kohlberg; contractors, Koch & Grimes; signed, May 9; filed, May 12; cost $900.

Oak near Webster. Moving and underpining; owner, Edmund Schuntenbus architects, Salfield & Kohlberg; contractor, H. Behrens; signed, May 9; filed, May 12; cost $1264.

O'Farrell near Franklin. Carpenter work and tin beams; owner, The Deutsche Evang. Luthern Church; architect, H. Geilfuss; contractor, F. Klatt; signed, April 27; filed, May 15; cost $19,540.

O'Farrell near Franklin. Plastering, etc.; owner, The Deutsche Evang. Church; architect, H. Geilfuss; contractor, Chas. Dunlap; signed, April 27; filed, May 11; cost $2090.

O'Farrell near Franklin. Brick and stone work; owner, The Deutsche Evang. Church; architect, H. Geilfuss; contractor, Adam Beck; signed, April 27; filed, May 11; cost $16,927.

O'Farrell near Franklin. Artificial stone work; owner, The Deutsche Evang. Luthern Church; architect, H. Geilfuss; contractors, Camp & Carillon; signed, April 27; filed, May 11; cost $1149.

O'Farrell near Franklin. Heating appliances; owner, The Ductshe Evang. Church; architect, H. Geilfuss; contractors, Ford Bros.; signed, April 27; filed, May 11; cost $1681.

O'Farrell near Franklin. Painting; owner, The Deutsche Evang. Church; contractor, August Fick; signed, April 27; filed, May 11; cost $1264.

Pacific Ave. near Devisadero. Excavation, concrete, etc.; owner, Annie Meyer; architect, E. A. Hermann; contractor, Carl Greise; signed, May 25; filed, May 26; cost $1822.50.

Post and Montgomery. Elevator; owners, Masonic Hall Associati n; architects, Kenitzer & Barth; contractor, John Hammond; signed, May 4; filed, May 10; cost $6875.

Ridley and Scott. To build; owner, B. Tenderlein; contractor, A. De Fair; signed, May 10; filed, May 11; cost $7000.

Seventeenth near Dolores. To build; owner, Eugene Kelly; architect, Oliver Everett; contractor, Ralph Carey; signed, May 22; filed, May 24; cost $2844.

Sutter street, 1525. Alterations and additions; owner, Mrs. H. Hug; architect, Edmund Kollofrath; contractor, John Furness; signed, May 15; filed, May 16; cost $3922.

Twenty-fourth and Guerrero. Two-story frame and three-story frame; owner, C. Branagan; architects, Martens & Coffey; contractors, Ackerson & Paterson; signed, May 14; filed, May 14; cost $10,425.

Union and Jasper. To build; owner, G. Rocca; architects, Townsend & Wyneken; contractor, G. Masoletti; signed, May 5; filed, May 10; cost $2385.

Union near Laguna. Carpenter work; owner, Jno. M. Allyne and W. H. White; architect, Chas. Geddes; contractor, Jas; McLean; signed, May 25; filed, May 28; cost $6925.

Union near Laguna. Plastering and brickwork; owner, John Allyne and W. H. White; architect, Chas. Geddes; contractor, H. H. Larsen; signed, May 25; filed, May 28; cost $1184.

Utah and Santa Clara. Alterations and additions; owner, Michael Fogarty; architect, Jas. P. Brady; contractor, Thomas F. Mitchell; signed, May 10; filed, May 11; cost $1400.

Valencia and Quinn. Excavation, brickwork; owner, Sarah B. Melone; architect, Clinton Day; contractor, G. Connon; signed, May 25; filed, May 28; cost $886.80.

Washington bet. Powell and Mason. To erect two three-story frames; owner, M. Ghishla; architect, Emile Depierre; contractor, P. A. Antonelli; signed, May 14; filed, May 15; cost $9000.

Washington and Laurel. Two semi-detached frame buildings; owner, John Dempster McKee; architect, W. H. Lillie; contractor, R. P. Hurlbut; signed, May 17; filed, May 19; cost $10,612.

Washington near Locust. To build; owner, Chas. Clark; contractor, Casper Zwierlein; signed, May 23; filed, May 23; cost $7140.

Webster and Pine. Two-story frame except plumbing; owner, Jacob Clauss, architect, Wm. H. Wharff; contractor, Jacob Schaler; signed, May 23; filed May 28; cost $1137.50.

SINCE our last issue the all absorbing topic of discussion throughout the length and breadth of the United States, is the present struggle for supremacy between organized labor and organized capital.

Deplorable as are the immediate results of this bitter fight, yet we look for good as its ultimate result.

If the present struggle shall awaken society to a realization of the gravity of the present situation, and the absolute necessity of devising laws to establish a just equilibrium between the conflicting demands of Capital and Labor, the price the country is now paying will not be too much for the lesson.

It is doubtful, however, if that point has yet been reached. The absolute necessity of finding a just and equitable solution of the problem, is not yet realized by the public or its government. The law has very properly put down the lawless element, when it reached the point of violence and disorder. The true aim of government, however, should be to find means of preventing the cause of violence and disorder, and it will probable take more serious uprisings to bring this truth home to the people.

But as all progress in human affairs is achieved solely by and through strife, the desired improvement can only be expected to come through this means. To improve the condition of the people of France, humanity waded through the blood and horrors of the revolution. To solve the problems of the present age, may take equally as deplorable means. How disastrous the temporary results may be, only the future can determine.

If capital endeavors to push a temporary advantage to such a point as will drive defeated labor to desperation, or should labor become so exacting as to demand more than its just share of the benefits of production, the solution of the question will become infinitely more difficult. But it is not unreasonable to hope that progress is being made to a solution that will result in ultimate benefit to the growth and prosperity of this American government, and American people.

Possibly the material struggles could be averted, and peace attained at less cost, if the disputants would be content to substitute reason for brute force, and a christian spirit of conciliation in place of the arbitrary use of power and the threats and intimidating methods now employed.

A peaceful result, however, is too much to expect at the present stage of human progress, and it is extremely doubtful if vital questions will ever be solved without an appeal to force and violence.

ON THE USE OF COLOR IN ARCHITECTURAL DESIGN.*

BY H. LANGFORD WARREN.

IT is hardly beyond the truth to say that, so far as the exterior of buildings is concerned, there has been until recently no use of color in architectural design since the close of the sixteenth century in Italy. And even now, though some attention has of late been given to this subject, both here and in Europe, which has produced some successful color design, the most striking fact with regard to our use of color in architecture is probably our timidity. This modest caution in the first unwonted essays at color treatment after so long disuse is certainly wise and right, since too great boldness in this matter is more likely to lead to failure than success. But the possibilities of the use of color in architectural exteriors and the right treatment of it certainly demand more serious consideration than they have generally received. To treat the exterior of a building in a single material and in absolute monotone is doubtless the safest procedure, and is vastly preferable to an ambitious but faulty color scheme, but it is clearly to give up one important source of beauty in architectural design.

Ruskin, in a characteristic passage in his "Seven Lamps of Architecture," thus expresses his opinion on the subject: "I do not," he says, "feel able to speak with any confidence respecting the touching of sculpture with color. I would only note one point, that sculpture is the representation of an idea, while architecture is itself a real thing. The idea may, as I think, be left colorless and colored by the beholder's mind; but a reality ought to have reality in all its attributes; its color should be as fixed as its form. I cannot, therefore, consider architecture as in anywise perfect without color."

In this opinion most architects nowadays will probably concur, though monotone is still largely the rule in the exteriors of our buildings, and there are not wanting those who maintain that it is the ideal and the only dignified treatment. Such a view, however, receives but little support from the authority of the past. Most ancient buildings, it is true, are of one color *in their present condition*, and our architectural ideals are doubtless largely formed by the noble buildings of the past *as we have seen them;* yet we know that when their builders left them most of them were glowing with color.

To recall briefly the history of the color treatment of buildings will show the extent to which color has been employed in architecture.

The columns and walls of the Egyptian temples were covered with rich color decoration which, in most instances, still remains to this day. The capitals, which borrowed their form from the lotus flower or bud, were painted in red and green and white, with ornaments closely imitated from the same plant. The shafts were similarly decorated in color or with hieroglyphics incised and painted. If most of this color is to be found in the interior of the temples, it is because the architecture itself was mainly internal. But little external architectural effect was sought in Egyptian temples until a comparatively late date, except about the entrances, and these were always decorated with color.

In Greece, the marble of the temples (or the fine stucco which covered walls and columns where a coarser stone was all that could be obtained) was regarded as a field for ornamental color treatment. Indeed, the marble seems to have been chiefly prized for its excellent surface for color decoration. The Greek temple did not stand out entirely white against the blue sky, as we are apt to picture it to ourselves but was a glowing mass of color. Since the day of Hittorf's color restorations this is no longer matter for conjecture, but has been clearly proved by the numerous colored fragments and traces of color which have been found. Mr. Edward Robinson has recently fully shown, both by literary evidence and by traces of color which he has found, that even the statues were fully colored in a somewhat conventional manner. The Romans, heirs to the arts of Greece, followed the same methods. The well-known statue of Augustus, for instance, retains such complete traces of color as not only to show that it was entirely painted, but to make on accurate restoration of the color possible. But in the decoration of their buildings the Romans seem to have used applied color much less than the Greeks. Instead of this they obtained their color effect by the use of variegated marbles and precious stones, though applied color was used, especially when expense precluded the use of the more precious materials. The use of applied color in the provincial towns has been made familiar to us by the discovery of Pompeii and Herculaneum. And similar treatment was employed in many buildings of Rome itself; though here in the more important public buildings columns were made of porphyry, verde antique, and rich marbles from the East, and variegated marble was used in slabs as a covering for the walls. Gilding was also lavishly employed in capitals and other members. This method of obtaining color effect by the natural color of rich materials continued in the Byzantine empire, which added to it the use of mosaic. (The marvelous church of St. Mark at Venice is the most familiar and the most beautiful example of this style.) And it continued in Italy through the various styles that followed until the later Renaissance.

The medieval architects of the northwest of Europe did not have these richly colored materials at their command, but they were far from giving up, on that account, the use of color. The very fact of the fairly complete preservation in which the great cathedrals have for the most part come down to us, so far as their general form is concerned, makes especially difficult to us the realization of what their appearance must have been when they still had all their color decoration. But enough traces of color are still clearly visible to show their original condition with tolerable certainty. In a general view, these venerable buildings seem to have no color but the natural gray of the weather-beaten stone—no more variety of tint than can be found in some old cliff of which their walls so much remind us, stained and worn as they are by time and with weeds and brambles growing in their crannies. But if we carefully scrutinize the hollows and protected portions of the carvings, especially in the porches, we shall almost certainly find unmistakable remains of applied pigment. Especially is this the case, for instance—or was before the restorations—in the porches of the cathedral of Amiens, where the pigment used on the molding of carved roses and of the hawthorne in its natural colors could still be plainly seen in places. The most striking and complete example I have seen and noted of medieval color decoration on the exterior of a building is to be found at the Church of St. Martin at Laon, in the central porch of the west front—which dates from the fourteenth century. Enough remains to show that this porch was completely covered with color. The columns and arch moldings were painted in red and yellow chevron stripes and similar patterns, which can be clearly traced. In the tympanum are carved two angels swinging censers on each side of a figure (probably of Christ or the Virgin) which has disappeared and which stood on top of the center mullion of the door. The angels' wings were gilded and their robes were tinted. The background was filled in with other painted angels, and the under side of the tabernacle roofs over the figures in the

*Prepared by invitation of the American Institute of Architects, to be read at its annual convention, but by its courtesy made a part of the programme of the Congress of Architects.

porch was painted blue. These colors and other similar remains are quite crude. What the general effect of this treatment must have been in an interior, one gets a clear and undoubtedly substantially correct idea from the restoration of the Sainte Chapelle at Paris, especially in the upper chapel. In the interiors the remains of color are more frequent and in better preservation, as would be expected, and are especially to be noted in the chapels and on tombs and rood-screens. A very interesting and complete example of color applied to interior architecture is to be found in the rich late Romanesque porch now walled up, on the north side of the cathedral of Rheims.

It is clear that one should picture to himself the completed cathedral of Medieval France as richly decorated with color inside, besides the stained glass windows; the color overflowing, as it were, and covering the porches, which were probably entirely covered with rich coloring. Color was, it seems likely, also, more sparingly applied to other portions of the exteriors.

The interiors of the cathedrals of Italy at this time were also fully decorated by applied color, for mosaic, which had been introduced from Byzantium, fell more and more into disuse as fresco painting developed. But in the exteriors, in connection with colored marbles, which, as we have seen, were principally relied on for color, mosaic continued to be used, as in the gorgeous fronts of the cathedrals of Siena and Orvieto. With the coming of the Renaissance mosaic becomes still more unusual. But colored marbles were never used with more delicate taste or more beautiful effect than they were by the architects of the early Renaissance in Italy, and there are few classes of buildings so fruitful of lessons in the right principles of the application of color to buildings. The little Monte di Pieta and the palazzo publico at Brescia, or Fra Giocondo's loggia, at Verona (in which sgraffito is also employed), or the Ca'Dario or Ca'Trevisan, at Venice, may be named as examples of these.

With the further advance of the Renaissance, color gradually disappeared from the exteriors of buildings, first in Rome and Florence, later in Venice, whose delight in color led her; while other cities were already contenting themselves with monotone, to cover even the exteriors of her buildings with paintings by Giorgione, Veronese or Sebastiano del Piombo, the faded remnants of which may still be dimly seen on her walls.

In this rapid survey, no mention has been made of the styles of the East or of the Moors in Europe—styles essentially dependent upon color for their beauty. Attention has been purposely confined to those styles which have been developed in, or have directly influenced, western Europe.

What has been said recalls enough of the history of color in architecture to show clearly that the later, and especially the debased, Renaissance is the only style which, until modern times, has attempted to dispense altogether with color as a means of architectnral effect, and that in most styles color has been regarded as of essential importance, the apparent exceptions being due, until the time of the Central Renaissance, to lack of means rather than to preference.

In the face of this unanimity of opinion and of precedent, it would be difficult to argue in favor of a general use of monotone in the exteriors of buildings. The strength of argument lies, however, altogether in favor of the employment of color. But it must be confessed that many of the recent attempts at external color treatment are far from successful. Such use of color is as yet new to us, and it is not matter for surmise that there should be some bungling. Especially to be regretted, for instance, is the placing of color emphasis on the quoine at angles and on window and door jambs. This treatment was first, I beileve, brought into prominent use by the late H. H. Richardson, and has since been much imitated; but like most great men it has been Mr. Richardson's fate to find more imitators of his faults than of his good qualities.

In view of the growing desire for color treatment and its difficulty, a statement of the principles which should govern color design in architecture is often asked for.

In the first place, it must be said that there is perhaps no subject more difficult to consider by means of *words*, inasmuch as almost any color scheme which it is possible to describe in words can be made harmonious and perhaps beautiful in the hands of a true artist, or may be discordant and ugly, arranged by a person without color sense. The delicate variations and the proportioning of one color to another, which make the difference between beautiful and unpleasant, are too subtle to be described in words. In the next place, while the color sense may undoubtedly be trained and strengthened by proper instruction and by observation and practice, yet it is useless for anyone without that inborn color sense to undertake to have anything to do with it. So that of color more than of any other object to study, the paradox is true that instruction is unnecessary for those that are gifted and useless for those that are not. Finally, while for the reasons above given, dogmatism with regard to color is especially out of place (for a master will upset all rules), yet there is, perhaps, no subject so difficult to treat without dogmatism, since it is too subtle for argument, and conclusions with regard to it are necessarily based on observation and experience, guided by taste and feeling—not by reasoning. So much premised, a few general principles may be stated as marks to shoot at.

The first principle I feel inclined to lay down is that any theory of color design, taken as a guiding rule for practical work, is certain to be fatal to the result. What horrors have not been perpetrated in the name of the old theory of the primary colors—red, blue and yellow, with their secondaries, tertiaries, complementary colors, and what not; a theory which, to be consistent, would have us refuse to see any beauty in the colors of a peacock's tail or a for-get-me-not. But this theory has been exploded. Very true. But as a guide to color design the Jung-Helmholtz theory is not much better. It can to some extent analyze and explain, but it cannot construct. And an artist is not concerned with analysis and explanation, but with creation and enjoyment. Ruskin's theory that the *principles* upon which nature applies her color must be right, and that therefore color as applied to architecture must not follow constructive lines, because in nature it does not (as in the tiger-skin,) would, logically followed, lead to absurd conclusions.

Furthermore, the different styles demand different color treatment, so that general principles are the more difficult to lay down.

In approaching the study of color, let us then clear the ground by getting rid of all theory at the outset, and let us follow our sense of what is beautiful.

In what has been said above it is not meant to imply that nothing is to be learned from nature for our color treatment of architecture. A few broad principles we may perhaps glean from her, but our lessons will be for the most part in learning what is beautiful, rather than by opportunity for deducing recipes or theories. The English architect, E. L. Garbett, in his little book on design, mentions one of the few general principles it may be safe to deduce. "In nature," he says, "sameness of coloring is the rule, variety the exception; the former being found in all large or grand objects and broad surfaces, and the latter only in small and scattered organisms." A general law is no doubt here pointed out—by "sameness of coloring" Garbett cannot, of course, mean absolute sameness, but the sameness of a green tree where the whole is green, but there is great variety of green in the individual leaves; or of a gray cliff, where the whole is of one prevailing color, but with much variety of shade and tint within certain limits. But the principles here indicated in so far as valuable as guides in color design, are so not because we find them in nature, but because we see by observation that they apply also to art. A small building may, if you please, be a glowing mass of color; but a large one, all of vivid and varied color would be tiresome; to have dignity and impressiveness it must have one dominant prevailing tone. This may be seen by comparing two such buildings as the quomos of Florence and of Pisa The Pisan color is much pleasanter and gives greater dignity of effect on account of its broader massing. The building is mainly of one color (white marble, now a rich gold with age) with mosaic patterns of various marbles in tympana and spandrils, while the cathedral of Florence is checkered all over with colored marbles—dark green, white and reddish brown. The dominant color must be selected with the greatest

care with regard to the surroundings of the building and the colors of adjacent objects, of whatever kind, with which it will come in contrast. This is a point too often not enough considered in the choice of building material. But this dominant color will not be of absolutely uniform tint. If there is to be any beauty of color there must be some variety, as in the leaves of a green tree where light and shade add to the variety of local color, or in a cliff, or mountain side, or pebbly beach. If stone is used, the different blocks will not be accurately matched in shade, but will be so placed as to make slight contrasts in tint between the different blocks. If the structure is brick, the brick will not be culled, but used with all the accidental variety the kiln affords. No surface could well be ugher than the respectable brownstone front, or the wall of culled red pressed brick. Indeed, it is strange how, when traveling in Europe, we can admire the variety of color in old brick and stone walls, and tile roofs, and then when we return home continue to build with the utmost monotony of tone our great mechanical skill can attain, and proceed to wonder why our wall surfaces are lacking in beauty. The dominant shade may be further varied by delicate contrasts of other material in friezes or spandrils, as is so beautifully done in the cathedral of Pisa or the palazzo municipale at Brescia already referred to.

If vivid color is to form a part of the scheme, it should be mainly confined to the recesses of loggias and porches, and should be focused at some one point—for instance about the entrance—which should form the key and climax of the whole design. But the mistake is often made of supposing when color treatment is mentioned that vivid color is necessarily intended. Every building necessarily has its *color*, whether vivid or subdued, greatly varied or largely in monotone, and this color should receive careful study and consideration, and should not be left to be decided by accident, or by the whimsies of inconsiderate building committees. Indeed, the whole design should from the outset be made with a certain material and a certain color treatment in view. The fact that the color scheme may seriously affect the apparent proportions of the building is often overlooked.

Whether the color of a building should be natural or applied, will necessarily depend largely on circumstance and on climatic considerations. The climate, indeed, and the kind of light it brings with it, is of the utmost importance as a determining influence in the color scheme. In our climate there can be no doubt that we should depend for our color largely on the natural colors of materials. Applied color and rich decoration being confined to porches and loggias, as has been so effectively and for the most part so beautifully done at the World's Fair buildings.

Another principle too ofter overlooked is that, as Ruskin has pointed out, a certain mystery is necessary to perfect beauty and delightfulness of color. There must be constant change. The eye must be continually confused. Anything like mechanical regularity inevitably injures the effect. Thus, in using stones of different colors in the decoration of a building in bands or patterns, one color should be allowed to run over somewhat into another. In decorating a wall with bands of color—say, red and white marble, for instance—let occasional white stones find their way into the red bands and occasional red stones into the white. In the same way in using diaper patterns, let the pattern be broken by allowing the ground color to run into the bands—that is, let the bands occasionally disappear. This treatment will often be noticed in old English and Dutch brick diapers, and can be seen in the front of the Ducal Palace at Venice. Or if bright colored stones are used betweed the brackets of a cornice over a dull colored wall, as at the palazzo publico at Perugia, let some of the spaces between the brackets be filled with the wall color. In all these cases care must be taken not to lose the pattern; the eye must always unconsciously complete it.

Another principle seems to be that the contrast between two colors, used in anything like equal quantities, and either in large masses or pervading a whole design, must never be great. They must harmonize, as dull red and brown, greenish or purplish blue and gray. The vivid and strongly contrasting colors must only be used in small points to give value to the whole composition, and on the judicious use of these small points of bright color will depend the brilliancy and beauty of the whole. A single point of color may change a whole color scheme—may ruiu it or may give it just what it lacked. Thus, a point of light red may make a gray wall look blue by contrast, or it may make a brownish gray look red by sympathy. The effect of the stronger colors in changing the apparent color of duller hues placed near them is a matter always to be carefully considered, and is one of the things which makes color composition so difficult if not guided by that unerring instinct we speak of as "a strong color sense."

The marking of jambstones and quoins has already been spoken of as a thing to be avoided. Jambs and corners are essentially part of the wall, and should not receive a different color treatment. In general, the common practice with us of making the trimmings uniformly of one color and the rest of the work uniformly another is rarely effective and is generally a thoughtless or indolent subterfuge to avoid the serious study of color treatment, or to disguise inability to handle it. There can be no such rule-of-thumb for arranging the color of a building. It must always be a matter of feeling, and of separate feeling in each case; but feeling always, rather than thought. Good color can never be worked out like a mathematical problem.

Of late the perfecting of enameling of terra cotta and the richness of color obtainable in blocks of all sizes in this material opens a new and rich field for color design. But it comes with danger in one hand, though with promise in the other, and its rich possibilities will need to be used with reserve and caution if they are to lead to success.

The safe rule is, if you are a colorist, use color freely—indeed, you cannot help doing so when opportunity occurs; if you are not, have as little to do with it as may be.—*World's Congress of Architects.*

CORRESPONDENCE

Chicago, June 19, 1894.

To the Editor of the California Architect and Building News:

Dear Sir:—In the several articles lately appearing in your columns respecting the fire resisting qualities of concrete, I have noticed no allusion to the tests carried out by Professor Bauschinger of Munich which were published in this country some years ago. They were instituted I believe by the government, for the purpose of ascertaining the pre-resisting qualities of iron, stone, brickwork and concrete, and resulted in concrete standing out pre-eminent from them all in this respect.

Sometime ago a nitro benzine factory near Lyons, France, the walls of which were of concrete, took fire. The fire was of such a destructive character that the machinery was partly melted and the only effect on the walls, was to partly vitrify their inner surface.

At a fire at one of the government shops at Benicia sometime back. I examined the ruins, and whilst the granite and freestone trimmings had suffered severely, the artificial stone window head made of Portland Cement Concrete, were but slightly injured although they had stood the brunt of the fire; the bricks about them were badly injured.

Take any face brick made on the Pacific Coast, heat it to redness and plunge it into cold water and it will go to pieces. Firebrick even, often suffers under such a test.

With due care in the selection of the aggregates Portland Cement Concrete, will withstand fire better than any of our ordinary building materials. Yours Respectfully,

Ernest L. Ransome.

QUALITIES OF BUILDING STONE.*

The qualities necessary to the best possible building stone are: Workability, durability and beauty. It must also be cheap.

Workability includes in its meaning accessibility, a ready yielding to quarrying operations, the absence of refractory qualities under the hammer and chisel, and a texture and grain that will hold decorative finish.

Stone that cannot be quarried readily has the disadvantage of great cost to begin with. If the "raw material" is expensive, the finished product must be costly. On the other hand, if nature has so deposited her stores that the stone is easily taken from the quarry, still, if the material is refractory in the final cutting and finishing, no matter what may be its other qualities, it cannot be a very cheap material for the builder, as it will demand an over amount of expense and delay in preparation. Still less will it be desirable if it obstinately refuses to hold finish or decoration. Stone that comes from the quarry soft and yet somewhat tough, but hardening after a time, has the finest quality of workability. This renders it easy to quarry, very responsive to the tools of the cutter, and capable of taking easily and holding permanently the finish and decorative designs of the architect's specifications. It must be kept in mind, however, in examining stone, that if it comes from the quarry wet, and for that reason easily workable, it may again take up water after drying, which would be most objectionable; but if in the process of drying in the first place it passes through a chemical change which will render it ever afterward impervious to water, the quality is just what could be wished for in this regard. Usually an examination of the out-cropping surfaces of the stone in place will give a safe knowledge of its value as regards workability. Next after the character of the stone regard must be had touching the conditions of its deposit. Too much overlying matter, whether stone or earth, will usually make the quarry work very heavy and expensive. This overlying matter, technically called "stripping," is, as a rule, quite worthless, and must be entirely removed before the stone can be worked with steam channelers or other quarrying appliances, hence the necessity of a careful examination to determine its nature and extend in each case before opening a quarry.

Durability, as applied to building stone, includes every quality tending to make the material lasting and unchangeable after it is laid in a structure. These qualities are many and often seemingly conflicting in their nature. Hardness, elasticity, tensile strength, power to resist the greatest crushing force, imperviousness to water and invulnerability to the attacks of air and its corrosive and disintegrative burdens are some of the qualities, but not all. Eveness and homogeneity of composition, unity of substance, so to speak, and the power to resist extremes of heat and cold are quite as necessary. It will be seen at once that chemical analysis must be relied on to insure the best knowledge of some of these requirements. Some otherwise good and durable limestones will become corroded and discolored and have their integrity destroyed by the effect of sulphurous smoke from the burning of impure coals; others will be injuriously affected by the action of rain-water, and still others by the oxidizing power of the air. Some sandstones bear too much iron in their composition; others lack sufficient cohesion of the particles, whilst others yet are clayey or unequal in grain or texture. Every test of practical science should be given to stone before it is used in any building intended to be a permanent structure. As a rule, if the outcroppings ledges are found to be infiltrated with water, which makes the outer surface constantly damp, the stone will not be good, for this would indicate that it would take up too much moisture in the wall. Still, it is often the case that an apparently over-hydrous stone will dry out permanently after it is quarried and cut. Many of the sandstones, notably the better qualities of conglomerate, are of this character, and so soft when first taken out that they may be cut to any rough shape with a common ax or hatchet, but hardening after a few day's exposure so that water will not affect them.

The elasticity of stone may be tested by sawing it into long, slender strips, say two inches square and three feet long, when, if it be quite perceptibly flexible, its elasticity is good. If such a bar be suspended so as to hang free by a string and is struck a light blow with a hammer, its evenness and solidity of fiber will be attested by a clear, sweet metallic note, not unlike that of a fine bell, or that of a well tempered steel bar. As a rule the best stone will break with a direct line of fracture; but it may be conchoidal or otherwise indirect and still be unobjectionable. Parallel lines of cleavage or of stratification are always favorable indications where other features are promising.

Resistance to crushing weight may be pretty safely inferred from solidity of texture and eveness of grain; but it is always necessary before a final acceptance to submit the material to the severest tests of an apparatus for that purpose. This will be described in the proper place.

In examining sandstone, with a view to building purposes, the outcropping, if there be any, should be carefully scanned with a view to discovering what effect long exposure to the atmosphere and the rigors of winter may have had upon it. If the stone has "weathered" badly this will be shown by one or another sign of disentegration or demolition and a talus of fragments and sand will be found formed at or near the base of the outcropping cliff. Often the substance of the rock will show unmistakable evidence of inequalities of structural composition, such as horizontal cavities caused by the weathering out of seams or streaks that, on account of bearing too much iron, have oxidized and crumble away. Such stone, if used in a building, would prove worthless and, therefore, dangerous. It is often the case, as I have observed during a long experience in civil engineering, that public bridges erected by counties are rendered unsafe by having their piers and abutments constructed of this kind of stone, and that, too, in places where most excellent material lay near at hand, and which a little knowledge of the nature of stone would have pointed out to the superintendent. Too frequently it happens that appearances of the most untrustworthy kind are relied upon where an ignorant person is set to do work which ought to be in charge of a skilled and well-informed engineer.

In judging of the probable durability of limestone, before subjecting it to any test of science, the same observations should be made as in the case of sandstone, with a view to ascertaining its weathering qualities. Any unequal discoloration of the face of the exposed ledge should be scrutinized carefully. Usually these are caused by the presence of iron in the composition of the rock. But limestones are much more injuriously affected by hidden faults of composition than are sandstones, and for this reason they demand a much more careful examination before any extensive quarries are opened. It is often the case that iron in limestone will do no more than discolor the outer surface on exposure to the action of air and rain-water; but even this is a serious defect when the stone is to be used in any structure wherein beauty is a chief object. For the rough masonry of

*From 17th Indiana Geol. Report.

ordinary bridges, and for the hidden foundations of buildings, a cheap and durable stone is what is most wanted, and in these discoloration is not a fatal fault.

Beauty, when applied to any building material, includes all the good qualities already enumerated with the added value of a pleasing color, or combination of colors and a general effectiveness of appearance when the structure in which it is used has been completed. The variegated granites undoubtedly are the most beautiful of all building materials. Next to granite the red and brown sandstones are most pleasing to the eye, but the white, gray and blue limestones are very effective, and they have the advantage over granite in that they work much more easily in ornamentation, while they take figures in relief with far more clearness of outline than do the sandstones as a rule. Architects have long since discovered the pleasing effects to be produced by using different kinds of stones in the same building, placing each where its particular qualities will best serve the general motive of the design. As a rule, all else being equal, the stone which holds its native color best will be most beautiful in a building, and of the stones which change color, that will be most desirable which changes least and evenly. Some of the gray sandstones, however, change color unevenly and give a striking and ofttimes picturesque cloudiness to the surface, which adds to its effectiveness of color in a wall. The nearly white limestones that take on by exposure a dark cream-brown hue, if they do not contain too much magnesia, hold that tint very well and are quite beautiful. As a rule the presence of many large animal remains in a stone is objectionable on account of the tendency of such a composition to crumble; but where fossiliferous rock is durable it will usually be found very beautiful when cut, the organic remains bossing it over with variegations that greatly heighten its appearance. Stone which contains large fossils is not, however, the best for receiving raised ornamentations, such as figures in relief, no matter how durable and beautiful it may be, for the animal form will interfere with nicety of cutting and polish, as well as with the regularity of the figures. Fossils will usually be found harder than the matrix in which they are set, but this not always the case, for quite often the form is that of a hollow cast or impress, filled in with material which crumbles easily. As a rule fossils, though very hard, are but loosely set in sandstone, and often they are very large and rough forms of plants, extremely silicious and refractory. Blocks containing these are to be avoided as probably worthless for building purposes, however valuable and interesting they may be from a scientific point of view.

Many very beautiful stones that are not durable when exposed to the weather are very valuable for the inside finishing of buildings, where they will last for ages, holding the finest tints of their coloring without preceptible change.

From what has been said above it will be seen that every owner of stone beds should, before going to the expense of opening quarries, have his rock beds examined by an expert, whose report should show all the defects as well as all the good qualities of the material. Usually this can be done without any delay of labor or money, for the experienced geologist or engineer can quickly discover from the stone and its surroundings the nature of the deposit, and very simple chemical and mechanical tests will settle the question of strength and durability. There are beds of magnificent building stone lying undeveloped in many places, simply for the reason that the owners are not aware of the treasure they possess. In other places quarries are being industriously worked and the stone used in the erection of costly buildings, where in fact the material is wholly unfit for use on account of its lack of durability. I have examined many extensive structures whose stone was fast crumbling away. True, a few years will not show much decay, but in the long future the result will certainly be disastrous. The constant action of the atmosphere, the expansion and contraction consequent upon extremes of heat and cold, and the disintegrating effect of rain-water slowly but surely tell upon the integrity of the exposed parts.—*Maurice Thompson in Stone.*

So great is the echo in one of the rooms of the Pantheon that the striking together of the palms of the hands is said to make a noise equal to that of a 12-pound cannon.

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

CO-OPERATIVE BUILDINGS.

SOME years ago we discussed in these columns the advisability of a method of building to do away with the kitchen and many of the disadvantages of housekeeping, says *Architecture and Building*. The idea then started seems to be about to become an established fact, and the professors of the Chicago University will adopt, it is said, the scheme as elaborated by Mrs. Mary Coleman Stuckert for the erection of a model home settlement in that charming section of Chicago known as Hyde Park. Within a block of land forty-four houses of pressed brick and stone, tastefully constructed and varied, are to be erected. These houses may be of several stories, but none are to be over two rooms deep in order that they shall have essential light and air. In the centre of the flat is to be a large two-story building. Under this roof will be gathered the kitchen, laundry, cold storage plant and the machinery for heating and lighting. In the second story of this building are to be a kindergarten, library and a hall for amusements. The different houses are each to be connected with the central building by telephones and an electric conduit. The latter is to convey hampers for the meals to and from the kitchen. These hampers will be constructed of some non-conductive material in order that they will retain the heat. In the same hampers the dishes will be returned to the kitchen to be washed. There will also, however, be a central dining hall for those who wish or where large dinners may be given.

That the idea is considered feasible is proved by the action of the Illinois Chapter of the American Institute of Architects, who have invited Mrs. Stuckert to address them on the subject on July 2d. As Chicago may be considered the first to utilize the "skyscrapers," it appears that she is to be also the pioneer of another type of building enterprise which is likely to prove popular. We noticed a real estate paper claims that Mrs. Stuckert proposes to carry out an idea originated by them a few months ago, but Mrs. Stuckert is said to have spent several years in perfecting her scheme, which as we before stated, is an elaboration of our views published some years ago.

THE TOWER OF THE PHILADELPHIA CITY BUILDING.

ACCORDING to the Philadelphia *Press*, there are signs of movement in the tower of the Philadelphia City Building, and work has been suspended on the upper portion until the substructure can be strengthened. It will be remembered that this tower was originally intended to be the highest structure in the world. Since the design was made, however, its proposed height has been far surpassed by the Eiffel Tower, and, when the building is completed, it will probably hold only the third or fourth rank among high structures. However, a tower five hundred feet high is, in any case, a rather serious matter of construction, and it is not surprising that difficulities have been encountered. According to Mr. Powell, the newly-appointed architect of the building, who seems to have been the first to discover the movement, and point out the true cause, the foundation and first story of the tower were well built, of perhaps sufficient thickness, with brickwork in cement. Above the first story, for some unexplained reason, the walls, although about six feet thick, were built, for several stories, with lime mortar, with a facing of marble ashlar, twelve inches thick. Above the fifth story, the builder seems to have recovered his senses, or the architect to have realized what was going on, for henceforth the brickwork was laid in cement. As the weight on the masonry increased, the natural result took place. The walls of the first story and basement, being laid in cement, kept their place, Mr. Powell having found no trace of settlement subsequent to the hardening of the cement. Where the brickwork was laid in lime, however, there has, of course, been no hardening. The mortar in the interior of the walls is still soft, and the compression of the joints, added to the shrinkage from evaporation, has not only caused serious settlement, but by bringing the pressure on the thin, but almost incompressible marble ashlar, has crushed and split this to a rather alarming extent. Mr. Powell has arranged to fill up some of the arches in the lower part of the tower, and in other ways distribute and equalize the weights, and, as we gather from the newspaper account, to reinforce the masonry in lime with proper brickwork in cement; and it is much to be hoped that his efforts to stop further mischief will be successful. It will be remembered that considerable repairs on the lower portions of this tower had to be carried out nearly ten years ago, owing to carelessness of very similar character on the part of workmen or architect. At that time a considerable portion of carved and polished stonework had to be replaced because it had been cracked and crushed through the unequal settlement between the brick filling and the facing, the joints of the latter not having been laid slack enough to allow for the greater compressibility of the brickwork filling. Accidents of this kind are not so uncommon that their causes and remedies are not known to every one, and yet there are architects and workmen whose love for a close, neat joint in stonework is such, that they make use of it at the risk of having to make costly repairs later, such as these at Philadelphia or those demanded by a similar mishap at the Statehouse at Hartford.—*The American Architect and Building News.*

DISINFECTION OF SEWAGE BY MEANS OF LIME.

THE practical employment of lime for the disinfection of sewage, as recommended by Pfuhl, is as follows: In order to render free from danger fresh sewage that may contain the organisms of typhoid fever or Asiatic cholera, it is necessary that lime be added to the sewage in the proportion of, at least, one to one thousand. In this proportion, disinfection is complete in from one hour to one hour and a half. It is necessary that during the addition of the lime the sewage be kept in motion, so that there will be a homogeneous distribution of the lime throughout it, for it has been shown by experiment that in sewage not so stirred, lime may be added often to an extent of three to one thousand, and yet living typhoid bacilli may be detected after two hours, a condition evidently due to the restriction of the activity of the lime, to and immediately about the point in the still sewage at which it was deposited. In practice, it is further to be observed that the disinfectant activity of the lime is frequently interfered with through the presence of precipitating substances, such, for example, as the salts of sulphuric acid. It is also necessary that the lime should be of the best quality and freshly burned, so that in calculating the amount necessary for a given volume of sewage, only pure calcium hydrate will come into the computation.—*Internation Medical Magazine.*

JUDGE—"Well, doctor, what is the condition of the burglar's victim?" DOCTOR—"One of his wounds is absolutely fatal, but the other two are not dangerous and can be healed."—*Fliegende Blatter.*

NOTICE OF MEETINGS.

SAN FRANCISCO CHAPTER, AMERICAN INSTITUTE OF ARCHITECTS, meets second Friday of each month at 408 California street
SETH BABSON, Pres. GEO W. PERCY, Vice-Pres.
OLIVER EVERETT, Sec. JOHN M. CURTIS, Treas.

TECHNICAL SOCIETY OF THE PACIFIC COAST, meets first Friday of each month at Academy of Sciences Building.
C. E. GRUNSKY, Pres. GEO. W. DICKIE, Vice-Pres.
OTTO VON GELDERN, Sec. W. C. RALSTON, Treas.

CALIFORNIA ELECTRICAL SOCIETY, meets the first and third Monday evenings of each month at the Academy of Sciences Building.
GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

THE MONTHLY MEETING OF THE SAN FRANCISCO CHAPTER OF THE AMERICAN INSTITUTE OF ARCHITECTS.

THE regular monthly meeting of the San Franciso Chapter of the American Institute of Architects was held on the afternoon of Friday, July 13th, at the Mark Hopkins Institute of Art.

The ballots on the application of Mr. W. J. Lyon, for fellow membership in the Chapter were opened, and declared Mr. Lyons duly elected.

The principal topic of discussion was the proposition under consideration by the New York Chapter, on the advisability of modifying the schedule of charges as formulated by the Institute, as far as the same has reference to preliminary studies and competitive work.

The Chapter was of the opinion that the proposed changes were perfectly proper, and voted to endorse the recommendations of the New York Chapter.

THE DECLINE IN PRICE OF ELECTRICAL EQUIPMENTS.

IN commenting on the business situation and the decline in prices of electrical apparatus, the *Electrical Review* says: "Six years ago the price for a complete equipment for a trolley car, including two motors, was about $4,500. This price held for a year and a half and then dropped to $3,850, $3,500, and $3,300, until two years ago it was about $2,850. One year ago $2,000 was the price of the same equipment, greatly improved in quality and efficiency, while to-day the average price is between $1,000 and $1,200. We have been told of an electric railway manager who desired quite recently to purchase an equipment for a single car. He wrote to seven manufacturing companies, and immediately was called upon by seven salesmen, all of whom had paid traveling expenses to try for the order. The prices quoted ranged from $1,500 to $640. The manager bought the $640 apparatus. Here we have a decrease in actual selling prices from $4,500 in 1888 to $640 in 1894, a period of six years. In 1888 there were seven electric railways in the United States. In January, 1890, there were 162 electric railways in operation and in process of construction. In January, 1891, this number has grown to 281, while to-day there are probably over 500 cities in the United States equipped with electric roads, many of them of great mileage, as in Boston, Brooklyn, St. Paul, Minneapolis and Cincinnati.

"This marked reduction in the price of railway apparatus during the short period of six years is due largely to competition between manufacturing companies, but chiefly to a reduction in the cost of manufacture, accompanied by an increase in the quality of the product. The margin of profit on the equipment mentioned at $4,500, in 1888, was not as large as it was on a better equipment at $2,850, in 1892, owing to the reduction in the cost of the manufacture. While prices have been fearfully cut during the last year by all the manufacturing companies, partly due to intense competition and partly to the business depression, we do not believe that any company can make and sell a satisfactory car equipment for $640 and clear a profit on it."

LIGHTNING STRIKES A CHICAGO "SKYSCRAPER."

LIGHTNING struck the Teutonic Building, corner of Fifth avenue and Washington street, at noon of June 15th. The larger portion of the north finial of the balustrade on the Fifth avenue side was nearly split in two, a part falling to the pavement below and the remainder scattering over the roof and the court of the building. That part which traversed the distance of ten stories to the pavement fell among the passing pedestrians and, together with the shock of the storm, produced a panic. No one was injured, though several had narrow escapes.

A COUNTRY RESIDENCE.

The tenants of the big building from the tenth to the sixth floor felt the shock severely. In some of the rooms a panic ensued. Ex-Coroner Hertz, Colonel Moore, J. C. Saterlee and others, keenly sensitive to the shock and blinded by the brilliancy of the flash, fled into the hallway, where they were confronted by a fantastic display in the building's court, which seemed to form a center for the electric current in its efforts to reach the ground.

The Teutonic is the first of the "skyscrapers" to be struck by lightning. It is a steel structure from the basement to the roof. A close examination of the point of contact and the immediate surroundings, together with the fact that the electric-light plugs were blown out in the basement, suggests the conclusion that the electric current, after demolishing the terra-cotta covering of the finial, came in contact with the steel rod which supported the demolished finial, and by it was communicated to the steel structure itself, thus making a conductor for the electric current from the roof to the basement.—*Examiner*.

CASTLES IN THE AIR.

THE urban architects of the United States are interchanging views on the tendancy towards Tower of Babel architecture in our cities, and we are gratified to note that there is a unanimity of sentiment against the many-storied, steel-framed structures. But there is a diversity of opinion as to the best means of successfully opposing this tendency. While some think that drastic legislation should be properly interposed, says the *Architectural and Building Monthly*, others believe that moral suasion and public sentiment will prove sufficient checks. While we hold that the fewer legal restrictions upon any art or industry the better, yet when cupidity tempts a real estate owner to double or treble the capacity of a hundred-thousand-dollar building lot we have but little confidence in the potency of public sentiment as a deterrent. The "public-be-damned" policy has to be put down by other forces than moral suasion, and there are sufficient grounds on the score of sanitation, public comfort and convenience to warrant the interference of the strong hand of the law. Let there be, then, a limit put to the height to which city buildings may be carried, and let it be done before new cities are superposed upon the old ones. A few years more and the remedy may come too late.

LEGAL DECISIONS.

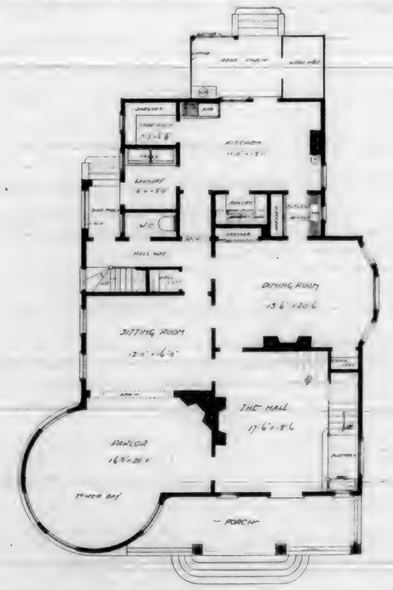
From a large number of Legal Decisions of the higher Court, of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

RIGHT OF CONTINUING PARTNER TO LIEN.—Under laws 1886, which requires that the statute relating to mechanics' liens shall be construed literally and in futherance of the remedy, members of a firm who requires the interest of his partner may have a lien for materials furnished by the firm.

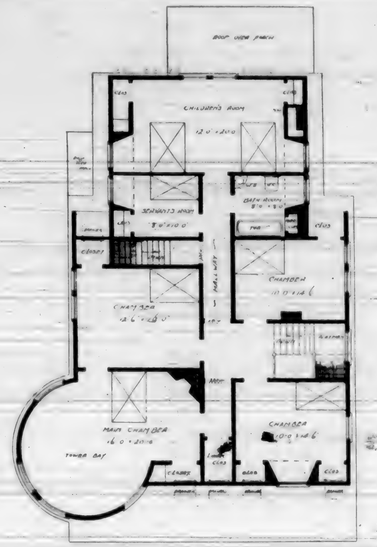
Ogden v. Alexander, Court of Appeals of New York, 35 N. E. Rep. 638. 52.

ACTION BY SUBCONTRACTOR TO FORECLOSE LIEN.—In an action by a subcontractor to enforce a mechanics' lien, it appeared that the contractor abandoned the contract, and forfeited the final payment, unless the owner waived the forfeiture, under the terms of his contract, and elected to complete the work, at the contractor's expense. The owner, in his lifetime, and his heirs, after his death completed the building, and asserted no claim of forfeiture. The subcontractor could enforce his lien on the surplus of the final payment over and above the cost of the completion. The fact that the owner did not give the contractor three days' notice of his election to complete the building, as provided by the contract, does not exclusively show that he did not so elect, where, when, the contractor abandoned the work, he made a general assignment to the owner, and neither such subcontractor, nor any one claiming under him, is asserting any need of such notice.

Ogden v. Alexander, Court of Appeals of New York, 35 N. E. Rep. 638. 160.



FIRST FLOOR PLAN.



SECOND FLOOR PLAN.

RIGHT TO MECHANICS' LIEN.—One who furnishes material and labor for the erection of structures on the property of a mining corporation, pursuant to a contract made in the company's name, by its authorized agent, is entitled to a mechanics' lien, notwithstanding the existence of an agreement, not known to him, whereby the agent was to have possession of the property, and make the improvements on his own sole credit.

Mammoth Min. Co. v. Sale Lake Foundry & Mach. Co., Supreme Court of the United Seates, 14 Su. Ct. Rep. 384

TRUST FOR PREFERENCE OF CREDITORS.—Where a debtor, for the purpose of securing certain debts, conveys in trust property less in value than the amount of such debts, a provision in the trust deed authorizing the trustee to sell at either public or private sale, and to employ clerks and attorneys to assist and advise him, will not affect the validity of the trust deed as to secured creditors, since they could not be injured by it. A provision in the trust deed for the benefit of creditors, directing payment of a stated sum to an attorney for services in drawing the deed and the execution of the trust is valid unless such sum is unreasonable in amount.

Butler v. Sanger, Court of Civil Appeals of Texas, 23 S. W. Rep. 487. 118.

INSURANCE CLAIM AS TO OCCUPANCY OF BUILDING.—Where a policy of insurance provided that it should be void if the premises became vacant or unoccupied without the written consent of the company should be indorsed. The tenant occupying the insured building partially moved out the day before the fire, leaving in the building a portion of his furniture. The premises were not vacant or unoccupied, within the meaning of the policy.

Liverpool & London & Globe Ins. Co. v. Buckstaff, Supreme Court of Nebraska, 56 N. W. Rep. 695. 72.

MECHANIC'S LIEN ON LEASEHOLD INTEREST.—A mechanic's lien for materials furnished and work done upon a leased building under a contract with the lessee extends only to the leasehold interest.

Z. C. Niles & Co. of Seattle v. Gordou, Supreme Court of Wash. 36 Pac. Rep. 266. 30.

BOOKS AND PERIODICALS.

PLUMMER'S REFERENCE MAP of the city and county of San Francisco, is a map up to date and well worthy of the prize that has been bestowed upon it by those who are competent to judge of its value. Not only a correct outline of the water front is given showing the different sections of the sea wall, and other important points of interest to those who empty steamboats, or are otherwise interested in the bay, but the addition of about 250 streets, avenues, alleys and places make it a map for all. To those who wish to keep up with the times and know about the city they live in we should say get this map at once. Mr. Plummer will be happy to receive orders at his office, 408 California street.

LIPPINCOTT'S for July has one of Captain Charles King's charming Army stories as the complete novel; and is as usual full of good things that will well repay perusal.

CLAY WORKER. Indianapolis, Ind. The June number of this excellent magazine has an illustrated article entitled "The Beginning of a National Ceramic Art in America" showing the great advancement that has been made in this country in that art, since the first rude attempts of the manufacturer to compete in that line.

The people of the coast have reason to congratulate themselves that the clay workers of this coast have made great progress in the development in the useful manufacture of architectural appliances from clay, as was shown in the exhibits at the Midwinter Fair.

PAPER AND PRESS. The Arts Printorial, illustrated. Published by W. M. Patton, Philadelphia, Pa. An interesting article "The Government Printing Office," will well repay a careful reading, and probably astonish those outside the trade by the enormous increase of business in this office from its commencement March 4, 1789 until the present time.

THE PHOTOGRAPHIC TIMES. Published at 423 Broome street, New York. The delayed mails from the east are now being promptly delivered, and among the large accumulation of exchanges we notice several numbers of the ever welcome *Photographic Times* the July number contains a charming view of "An English Country Lane." The seven ages of man, illustrated by photograph, is extremely funny.

THE AMERICAN AND BUILDING NEWS, contains an article very severe upon the recent strikes, that have unfortunately prevaded of late all over the country; the editor appears to look upon only one side of the question, and forgets that the constant comtempt of the law shown by many of the great companies for years past, have educated their employees to the same way of thinking. This unfortunate strike only required the display of a little common sense on the part of the managers to have been stopped at once. In place of that the men were excited to madness for the very purpose of having the troops called into the field.

A WANING FASHION.

ONE of the strangest vagaries of public taste is that which a few years ago brought yellow pine into prominence as a finish wood says *Hardwood*. A passing fancy was artfully and artificially developed into a craze, the effects of which have not yet entirely disappeared, there being still a few misguided architects and builders who insist, in season and out of it, that yellow pine is both suitable and desirable for all kinds of inside trim, from parlor to kitchen. The producers and handlers of the wood have done what they could to corrupt the public taste in this regard, and their efforts have been supported by the papers which draw a large share of their revenue from the yellow pine interest. They have sought to make people believe—and have met with no little success in the effort—that the red and yellow streaks, varied sometimes with crooks and curls, which are distinctively characteristic of the wood, are really beautiful, and that nothing more pleasing or satisfying to a refined taste is to be had in a low priced finishing wood. They admit that cherry and mahogany, and possibly quartered oak, are finer woods, but they urge their greater cost, and still maintain that after all yellow pine is as durable and nearly as handsome as any of its rivals. No doubt by continually preaching this artistic heresy they have come to believe in it themselves, but happily the taste of wood users is drawing away from the unsightly yellow pine, and is developing a greater appreciation of the quieter and handsomer native woods, any one of which for beauty and real excellence as a material for trim is so far its superior as to be beyond comparison.

It is not denied that yellow pine is a valuable timber. For nearly all structural purposes it is admirable, rivaling even oak in strength and stiffness. It makes a capital building material, and properly sawed, a fairly good flooring, but its merits are exhausted before we reach those which belong to a desirable finish wood, for which one of the leading requirements is beauty of color and grain. This yellow pine does not possess, the extravagant claims of its friends to the contrary notwithstanding, and for this reason it has no place in the exposed work of any building in which an effort is made to secure an artistic and handsome finish.

THE GOLDEN CHAMBER OF CONSTANTINOPLE.

ACCORDING to Bishop Liutprand, of Cremona, says the *Scottish Review*, the Golden Chamber was the most splendid part of the whole palace. If Justin rebuilt it, Theophilus and Constantine VII. did much for its decoration. Theophilus made a silver table "for the accommodation of the guests and the adornment of the palace," in which so many foreigners and courtiers feasted with the emperor. A great chandelier hung from the centre of the hall over the table.

The famous golden tree, so often mentioned in accounts of the palace, was constructed by Theophilus. "Birds sitting on the branches sung by some mechanism, the air being supplied by concealed passages." The walls were ornamented with mirrors and colored tiles, "affording the more pleasure to the guests owing to the delicious nature of the viands." Besides making the silver doors (into the Tripeton) Constantine VII. ornamented the walls and ceiling of the Chrysotriklinos with flowers and leaves, framed in silver circles.

In the Golden Chamber the most striking object must have been the Pentapyrgion, of which, unluckily, no accurate description has survived. It was "a magnificent structure of wood, covered with gold. Within and without it was hung a great variety of decorations, golden ornaments and the imperial robes." At the feast of Easter it was the custom that a small table should be placed for the emperor in the Pentapyrgion, while the foreign ambassadors whom he invited dined at the golden table below him. Thus it would seem to have been a sort of throne arranged for the purposes of a dining hall.

BUSINESS MOSAICS.

San Francisco Plating Works 653-655 Mission street, E. G. Denniston, proprietor. These well known and long established works, are always prepared to do any kind of gold, silver, nickel and copper plating. Metal goods of every description plated. Particular attention given to copper plating of architectural iron and steel work.

Little Daughter—"This book says that in Norway a girl has to make a whole lot of linen before she can get married." Mother—"Yes, it's the custom there." Little Daughter—"I'm glad I'm an American. Here we only have to learn to typewrite."—*Smith' Good News.*

Joseph Budde Manufacturer of Sanitary Appliances. Medals and diplomas awarded at the State Fair at Sacramento, Cal., in 1888 and 1889 for the popular Golden Gate patent water closet, speak for themselves. The best award of honor is perhaps the unaminous approval of those who have been fortunate enough to have their houses supplied with his appliances. The man that would find fault with what he can select from Mr. Budde's varied stock would indeed be hard to please.

"The landlord has put up the rent on the family that have the second flat." "Is there anything wrong with them?" "He thinks so they have never complained about anything."—*Chicago Inter-Ocean.*

Mr. George Goodman the patentee and manufacturer of artificial stone in all its branches can be found at his office in the Nevada Block, 307 Montgomery street; he makes a specialty of side walks and garden walks—but anything in his line is sure to be well done for the man takes a pride in his work, as well as knowing how to do a good job and is therefore entitled to his name of "Goodman."

Watts—"Do you always agree with your wife when she makes an assertion?" Potts—"Of course I don't. Do you suppose I want the poor woman to have no amusement at all?"—*Indianapolis Journal.*

The Western Iron Works.—Notwithstanding the dull times and general stagnation of business the above named firm moves on in the even tenor of a well regulated concern, and continue to furnish iron and steel building work; they are also the sole manufacturers of the Champion Steel Wheelbarrow against this, thank Heaven, there has been no strike, so it will doubtless continue to run.

"Then, when you have finished your lecture," said the professor of elocution and deportment to young Dulle, "bow gracefully and leave the platform on tiptoe." "Why on tiptoe?" queried Dulle. "So as not to wake the audience," replied the professor.—*Pearson's Weekly.*

The J. L. Mott Iron Works continue in the good work of manufacturing, contriving and improving all the various articles for making home a healthy place—all will agree that without good plumbing no home is what it should be. If you want your wife to be able to say "Well after all there is no place like home for solid comfort," you must be careful to see that your house is well provided for in regard to good plumbing. The deserved reputation of the J. L. Mott Co. known all over the United States is a warrant that you get what you pay for when this firm supply the goods. Mr. James their agent has his office in the Flood Building.

San Francisco Slate Co.—We have before now had occasion to call the attention of our readers to the excellent quality of the slate furnished by the above company. At the present time when discord between labor and capital is making such disturbance in our community, and shutting off all communication with the east it is well to make up our minds to encourage home industry and show the world we are in a great measure independent of the outside world, and can furnish supplies of the first quality in building materials, by encouraging home industry to the fullest extent should be the aim of all those who have the welfare of this coast in consideration. Information about their slate and quarries may be had at the rooms of the company, 4 and 5, tenth floor, Mills Building.

Teacher (in mineralogy class)—"Johnie, give me the name of the largest known diamond?" Johnie—"The ace."—*Tit-Bits.*

Phoenix Pure Paint—If you want facts about paints you should call upon W. P. Fuller & Co. who manufacture Phoenix Pure Paint, and who will give you all the reasons why their paint is considered the best, made of pure materials and finely ground and thoroughly mixed with heavy machinery are good reasons why their manufactured paint should stand A. No. 1.

"Has that horse a pedigree?" asked the tourist. "Nope," replied the honest farmer; "nothin' but the heaves."—*Washington Star.*

San Francisco Gas Light Co.—People who predicted a few years ago that gas had seen its day, when the electric light began to be talked about, reckoned without their host. The important fact that gas was an excellent substitute for coal in cooking was in a great measure over looked. Now when we find the body of the house before a neatly constructed gas stove with shining pans and kettles, making a pleasure of cooking instead of the slavery of the coal stove with its heat and ashes, dust and dirt, all that is changed. Those who have been deterred from the use of gas for this purpose by the bugbear that gas costs so much, will find if they make the experiment that gas does not cost so much.

She—"And so they were married! Was it a case of love at first sight?" He—"I imagine not. The first time he saw her she was riding a bicycle.—*Life.*"

Something new and useful.—Dixon's Waterproof Graphite Grease and Graphite Lubricants, manufactured only by Joseph Dixon Crucible Co., Jersey City, N. J. A table giving the results of experiments made at the Brooklyn Navy Yard by Robert Grimshaw, M. E., in collaboration with John A. Bell of the Eqipment Bureau U. S. Navy, clearly shows the advantage in the use of this Lubricant.

Miss Paddington—"Do you believe in love at first sight?" Mr. Linton—"Oh, no! It's impossible to be perfectly sure that a girl is rich."—*Boston Life.*

Mann's Patent Chimneys endorsed by the Board of Supervisors and recommended for general use by architects, fire wardens and insurance companies as the most complete and safest in the market. Can be found at 306 Sutter street bet. Grant Ave. and Stockton Sts. Messrs. Schuster Bros. agents, they are also sole agents for the Pacific Coast for the Celebrated Richmond Ranges, hot air furnaces and radiators. See their advertisement on page ii of this journal.

CITY BUILDING NEWS.

Army bet. Guerrero and San Jose. All work except brick and plumbing; owner, F. Kaufmann; architects, Townsend & Wyneken; contractor, F. V. Archer; signed, June 2; filed, June 2; cost $6700.

Army bet. Guerrero and San Jose. Plumbing; owner, F. Kaufmann; architects, Townsend & Wyneken; contractor, Nanon & Gordon; signed, May 19; filed, June 2; cost $1350.

Ashbury near Waller. To build; owner, Bedella Boyd; contractors, Jno. Sath and J. B. Cogswell; signed, June 16; filed, June 16; cost $3175.

Bartlett near 21st. Alterations and additions, except plumbing; owner, A. E. Patridge; architects, Townsend & Wyneken; contractor, M. C. Lynch; signed, May 31; filed, June 2; cost $5095.

Brannan and Fourth. Grading and concrete work for a church; owner, D. Neugent; architect, John J. Clark; contractors, Flinn & Tracy; signed, June 1; filed, June 2; cost $2,000.

Broadway near Scott. To build; owner, M. E. Fitzhugh; architect, Reid Bros.; contractor, B. O. Johnson & P. G. MacIntzer; signed, June 19; filed, June 23; cost $3600.

Bryant near Butte. Two-story frame; owner, B. Hardy; contractors, Genscrowsky & Kolbe; signed, June 26; filed, June 26; cost $2300.

California near Octavia. Alterations and additions; owner, Winson Brown; architect, W. J. Mathews; contractor, Concannon & Shay; signed, June 9; filed, June 14; cost $1570.

California near Broderick. To build; owner, Adolph Rapp; architect, Emil John; contractors, Lorenzen & Trevier; signed, June 9; filed, June 11; cost $3680.

Clay near Leavenworth. To build; owner, I. L. Hoffmann; architect, Chas. R. Wilson; contractor, F. V. Steinman; signed, June 15; filed, June 20; cost $6650.

Clay near Franklin. To build; owner, J. W. Edwards; architect, W. H. Lillie; contractor, F. G. Kronnick; signed, June 23; filed, June 23; cost $4700.

Clay near Franklin. Plumbing; owner, J. W. Edwards; architect, W. H. Lillie; contractor, H. Williamson; cost $1700.

Douglass from Ocean House Road. To build; owner, Frank Dummell; contractor, Robert Trost; signed, June 6; filed, June 8; cost $1513.

Eighth Ave. near California. To build; owner, William Royal; architect, C. S. Corrigan; contractor, C. Lansen; signed, June 12; filed, June 13; cost $1550.

Florida near Solano. Carpenter, plumbing, etc.; owner, H. Throde; architects, Martens & Coffey; contractor, F. M. Schwubler; signed, May 29; filed, May 31; cost $7250.

Florida near Solano. Excavation, stone and brick work; owner, H. Throde; architects, Martens & Coffey; contractor, J. O'Sullivan; signed, May 29; filed, May 31; cost $5843.

Fifth and Clara. To build; owner, W. N. Weeks; architects, Shea & Shea; contractor, James Cochran; signed, June 9; filed, June 27; cost $3618.

Fulton near Baker. To build; owner, Peter Garrity; architect, Edward Burns; contractor, Edward Mooney; signed, May 28; filed, May 29; cost $4600.

Grove near Broderick. To build; owners, John Peters and wife; architects, Smith & Freeman; contractors, Henry Whittle & F. Smith; signed, June 1; filed, June 3; cost $13,754.

"H" and 12th Ave. To build; owner, Mary V. Foley; architect, D. Foley; contractor, H. Behrens; signed, June 20; filed, June 22; cost $1550.

Hampshire near 19th. To build; owner, Patrick Dempsey; contractor, H. P. Conrady; signed, June 9; filed, June 11; cost $2700.

Henry near Castro. To build; owner, G. Carle; architect, H. Hess; contractor, C. Schwefzer; signed, June 12; filed, June 13; cost $1850.

Lake and Lake. To build; owner, L. W. Darbee; architect, Wm. F. Lee; contractors, R. A. William & Co.; signed, June 23; filed, June 23; cost $2100.

Leavenworth and Post. Mantels; owner, S. F. Verein Assn.; architects, Salfield & Kohlberg; contractors, Fink & Schindler; signed, June 15; filed, June 29; cost $1500.

Leavenworth near Clay. Grading; owner, I. S. Hoffmann; architect, C. B. Wilson; contractor, A. E. Buckman; signed, June 18; filed, June 14; cost $1800.

Linden near Octavia. Alterations, etc.; owner, G. H. Rudolph; contractor, U. G. Heath; signed, May 31; filed, June 3; cost $482.

Market near 5th. Granite work; owner, A. M. Parrott; architects, Pissis & Moore; contractor, Raymond Granite Co.; signed, June 14; filed, June 14; cost $21,405.

Market near 8th. Concrete and artificial stone; owner, L. W. Moffatt Ex. of Geo. Moffatt; architect, Chas. R. Wilson; contractor, W. F. Ambrose; signed, May 31; filed, June 15; cost $4,320.

Market near 15th. To build; owner, Charles E. Hanlon; architect, T. P. Ross; contractor, Geo. Connon; signed, May 28; filed, May 31; cost $4816.

Market near 5th. Brick and concrete; owner, Mrs. Emma Spreckles; architects, Reid Bros.; contractor, Crawford Ferries; signed, May 14; filed, June 3; cos $19,012.

Market near Eighth. Underpinning and repairing brick building; owner, Levi Strouse; architect, Chas. R. Wilson; contractors, Richardson & Gale; signed, June 8; filed, June 9; cost $1500.

Market near 5th. Elevator, etc.; owner, F. Gutzhow; architect, Edmund Kollofrath; contractor, T. Hammond; signed, June 13; filed, June 13; cost $4950.

Mason near Jackson. To build; owner, St. Johannes Church by Trustees; contractor, Henry T. Griet; signed, June 1; filed, June 5; cose $1050.

Minerva near Plymouth. To build; owner, Board of Education; architect, Chas. I. Haven; contractor, Morrison Cook; signed, June 7; filed, June 7; cost $3355.

Morton between Dupont and Stockton. To build; owner, Jules Einden; architect, Emile Depierre; contractor, Jean Salanare; cost $2300.

Neynda near Rhode Island. Carpenter and brick work; owner, Thomas C. Van Bibber; architect, Wm. H. Wharff; contractor, Geo. O. Dean; signed, May 29; filed, May 31; cost $1570.

Ninth near Howard. Carpenter work on three stores; owner, F. B. Wilde; architects, Smith & Freeman; signed, June 14; filed, June 18; cost $2400.

Ninth Ave. near California. To build; owner, C. E. Carbly; architect, Edward Burns; contractor, Geo. S. Paff; signed, June 26; filed, June 26; cost $3200.

Oak near Buchanan. To build; owner, H. Beckery; architect, H. S. Munson; contractor, F. H. Wheeler; signed, June 6; filed, June 8; cost $4,200.

Outside land block 29. Grading and filling; owner, La Societe Francaise de Bianfanssance Mutual; architect, Emile Depierre; contractor, E. F. Dennison; signed, June 18; filed, June 18; cost $1200.

Pacific near Dupont. To build brick building; owner, Paolo Arata; architect, Emile Depierre; contractor, P. A. Antonelli; signed, June 18; filed, June 19; cost $8650.

Pacific near Dupont. Brickwork and grading; owner, Paolo Arata; architect, Emile Depierre; contractor, P. A. Antonelli; signed, June 20; filed, June 21; cost $4800.

Pacific Ave. near Devisadero. Plumbing, sewerage and gas fitting; owner, Annie Meyer; architect, E. A. Hermann; contractor, H. Williamson; signed, May 29; filed, June 1; cost $2325.

Page near Broderick. Additions; owner, the Board of Education; architect, Chas. I. Haven; contractors, R. Doyle & Son; signed, June 7; filed, June 7; cost $5979.

Penna Ave. near Sierra. To build; owner, Thomas Hart; architect, Jas. Glackin; contractor, John Kennedy; signed, June 4; filed, June 5; cost $1065.

Pine near Scott. To add a story; owner, Board of Education; architect, C. I. Haven; contractors, R. Doyle & Son; signed, June 7; filed, June 7; cost $7498.

Post street No. 109. To build; owner, E. Preston; architect, Wm. Corbett; contractor, C. W. Kinsman; signed, June 6; filed, June 13; cost $3140.

Post and Powell. Mantel, grates and hearth work; owner, A. M. Parrott; architects, Pissis & Moor; contractors, Ruffino & Bianchi; signed, April 14; filed, April 14; cost $2557.50.

Sacramento near Pierce. Plumbing; owner, G. E. Bacon; architect, J. J. Manseau; contractor, W. R. Smith & Co.; signed, May 26; filed, June 5; cost $1400.

Sacramento near Pierce. Plastering; owner, G. E. Bacon; architect, J. J. Manseau; contractors, W. R. Smith & Co.; signed, May 26; filed, June 5; cost $1400.

Seventeenth near Serpentine. To build; owners, E. Perry & wife; contractor, J. J. Kolbe; signed, June 5; filed, June 6; cost $1980.

Steiner bet. Fell and Hayes; To build; owner, F. Marx; architect, M. J. Lyon; contractor, E. McWest; signed, May 21; filed, June 6; cost $3275.

Steiner bet. Fell and Hayes. To build; owner, F. Marx; architect, M. J. Lyon; contractor, E. McWest; signed, May 21; filed, June 9; cost $3300.

Steiner and Hayes. To build; owner, T. A. McCormick; architect, T. P. Rabin; contractors, E. S. Slack & F. Corbett; signed, June 21; filed, June 22; cost $3400.

Tenth near Folsom. Frescoing a church; owner, Rev. P. Scanlon; contractors, Rusch & Walker; signed, June 8; filed, June 11; cost $2400.

Tehama near 5th. Carpenter work, etc.; owner, L. Silverstone; architects, Salfield & Kohlberg; signed, June 14; filed, June 20; cost $3875.

Union and Laguna. Plumbing, etc.; owner, T. W. Allyne & W. H. White, architect, Charles Geddes; contractor, R. A. Vance; signed, May 26; filed, June 5; cost $1649.

Union near Laguna. Plastering, etc.; owners, T. W. Allyne & W. H. White; architect, Chas. Geddes; contractor, W. C. Watson; signed, May 24; filed, June 5; cost $1150.

Vallejo near Stockton. To build; owners, D. and Emma Stang; architect, Julius E. Krafft; contractor, F. W. Kern; signed, June 18; filed, June 19; cost $1820.

Valencia near Quinn. Alterations and additions; owner, Sarah B. Melone; architect, Clinton Day; contractors, Connon & Thompson; signed June 27; filed, June 28; cost $2670.

Washington and Laurel. Plumbing, etc.; owner, John Dempter McKee; architect, W. H. Lillie; contractor, W. H. Tobin; signed, May 31; filed, June 1; cost $1500.

The California Architect and Building News.

Copyrighted 1894, by the California Architectural Publishing Company.

OFFICE, 408 CALIFORNIA STREET, SAN FRANCISCO, CAL., U. S. A.

VOLUME XV. AUGUST 20th, 1894. NUMBER 8.

A MONTHLY JOURNAL DEVOTED TO THE ARCHITECTURAL INTERESTS OF THE PACIFIC COAST.

Published on or about the 20th of each month by The California Architectural Publishing Company. The Stockholders being Architects and others interested in the profession.

SUBSCRIPTION TO THE JOURNAL, - **$3.00** PER YEAR IN ADVANCE.

ESTABLISHED 1879. - - - INCORPORATED 1889
NOW IN THE FIFTEENTH YEAR.

W. J. CUTHBERTSON, President. OLIVER EVERETT, Secretary.

Remittances should be in the form of postal orders, payable to THE CALIFORNIA ARCHITECTURAL PUBLISHING COMPANY, and all communications addressed to the office of the Company, 408 California Street, San Francisco, Cal.

AS the usual dullness in business still continues the ways of the drummer are as hard as ever. This dullness has affected also the building trades for the last two years, and will continue to do so for the balance of this year. Next year a revival will take place if we may judge from the prior history of the world and by analogy. The commercial or distributing system under which we are working, and under which the civilized world has been working ever since history commenced requires these depressions and reactions to take place; and they will keep on taking place and with increased virulence for the simple reason that science of distribution has not kept pace with the science of production. With our wonderful scientific discoveries and machinery and mechanical power we can easily produce by using all available human labor working the ordinary number of hours per day enough products to fill the consumption of the civilized world of ten years in three.

Now while these are facts it is a self-evident proposition that humans are working too hard; and until they confine their working hours to four hours per day they will have to bear the hardships now scattered upon them. By doing this by distributing their labor throughout the ten years and all working instead of concentrating their efforts into five years and then laying off for the other five as they now are practically doing and being hard up and many starving for those five, people will be able to live well right along and not over work themselves at one time and go round with their hands in their pockets at another.

This unscientific way of production is well illustrated by the progress of the northern towns of this coast. Portland, Tacoma, Seattle, all concentrated their buildings in five years what ought to have been distributed over ten years at least so now they lie dormant.

No apology is needed in bringing attention to this in a professional journal as architects and the building trades are as much affected as any by this evil.

Let the law making powers of our boasted civilization, find and apply the remedy or remedies for such a deplorable condition of human affairs and general plenty and contentment will reign; and instead of longing for destruction to take place so as to provide work, we shall all strive to conserve all our wealth as there will be nothing gained by destroying it.

LAVER VS. CITY HALL COMMISSIONERS.

SOME fine legal points have been lately raised in regard to the matter of the completion of the New City Hall.

Architect Laver, the designer of the original plans for the building, has lately filed a suit asking the courts to restrain the commissioners from carrying out their designs for crowning the unfinished rotunda with a dome, instead of the square clock tower designed by Mr. Laver.

By the courtesy of Mr. Laver we are enabled to publish the full text of his complaint against the New City Hall Commissioners in this matter.

FIRST—That said Plaintiff now is, and for many years prior hereto, has been a tax payer in said City and County of San Francisco, State of California, having real property during all of said time listed upon the assessment roll of said City and County and duly assessed therein:

SECOND—That said Defendants, L. R. Ellert, William Broderick, and H. T. Creswell are now and for more than one year last past have been the duly and legally constituted, qualified, and acting members of said Board of New City Commissioners, in said City and County of San Francisco.

THIRD—That heretofore, to wit: On or about the first day of April, 1870, the Legislature of the State of California duly past an Act, entitled, "An Act to Provide for the Erection of City Hall in the City and County of San Francisco," and said Act was approved by the then Governor of said State on the fourth day of April, 1870. That under and in accordance with the provisions of said Act, said Governor appointed P. H. Cannavan, J. G. Eastland and Charles McLane as Commissioners of said City Hall provided to be elected by said Act, who immediately thereafter, duly qualified as such Commissioners by taking the required oaths and giving the required bonds, and organizing as required by said act "The Board of City Hall Commissioners" in said City and County of San Francisco.

FOURTH—That on or about the eleventh day of February, 1871, said Board duly adopted complete designs and plans as prepared and presented to said Board by the firm of Fuller, Laver & Co. for said City Hall, which said designs and plans are now on file in the office of the architect of said building. That no other and different plans for said building were ever adopted by said Board. That according to the said designs and plans there was to be built upon the Southern middle portion of said City Hall and as a part thereof a Square Clock Tower of the height of about four hundred and fifth-three (453) feet.

FIFTH—That on the twenty-fourth day of March, 1876, the Legislature of said State of California duly past an Act, entitled, "An act to Provide for the Construction of the Building in the City and County of San Francisco, known as the New City Hall" and by the provisions thereof, the then Mayor, City and County Attorney, and Auditor of said City and County of San Francisco, were authorized and empowered to act as a "Board of New City Hall Commissioners" for the said City and County of San Francisco.

SIXTH—That immediately after said twenty-fourth day of March, 1876, said Mayor, said City and County Attorney, and said Auditor duly qualified as such Commissioners as required by said last mentioned Act, and proceeded to, and did duly organize said Board of New City Hall Commissioners and they and their successors in office ever since have constituted and now do constitute "The Board of New City Hall Commissioners" of said City and County of San Francisco. That said last mentioned Board, as directed by the provisions of said Act of March 24th, 1876, on or about the first day of April, 1876, took possession and control of all the plans, specifications and designs of every description and kind of said building, which has been adopted as aforesaid, and which were then in the possession of the Board of Supervisors of said City and County of San Francisco, and ever since and now have the same in their possession and under their control.

SEVENTH—That under and by virtue of the provisions contained in last aforesaid Act of the Legislature of said State of California, said Board of New City Hall Commissioners were authorized, empowered, and directed to proceed with the construction and completion of said New City Hall according to the plans theretofore adopted on said eleventh day of February, 1871, for said building, to wit: the said plans of said Fuller, Laver & Co.

EIGHTH—That on or about the fifth day of May, 1894, said Board of New City Hall Commissioners entered into a written contract with the firm of O'Connell & Lewis for the erection and construction of a dome of the height of two hundred and fifty feet, upon said City Hall in the place and stead of said clock tower as indicated and provided for by the designs and plans of said building theretofore adopted as aforesaid. That the plans and designs according to which said Board of New City Hall Commissioners have contracted as aforesaid with the said firm of O'Connell & Lewis to construct said dome are entirely different from the said adopted plans of the said Tower. That said Plaintiff is informed and believes and therefore alleges that said Dome, if constructed in accordence with the terms, conditions, specifications and plans contained in said contract will cost over fifty thousand (50000) dollars more than said Tower would have cost, if built according to the plans adopted as aforesaid, and said Dome will materially detract from the architectural beauty of the said building. That said contract is wholly illegal and unauthorized and will if carried out and completed work irreparable injury to the Plaintiff.

NINTH—That said last mentioned Board of New City Hall Commissioners have, prior to the commencement of this action by resolution passed at a meeting of said Board, resolved to pay to said firm of O'Connell & Lewis the sum of $5250.62, as part payment for work performed and materials furnished under said contract, and said last mentioned Board threatens and will if not restrained by order of this Court allow the said claim and direct the Auditor of said City and County of San Francisco, to audit the same, and further proceed to have said Dome completed as provided by said contract.

TENTH—That all money agreed to be paid to said firm of O'Connell & Lewis under said contract for the construction of said Dome, will be paid out of the New City Hall fund in the hands of the Treasurer of the said City and County of San Francisco, and said fund is a part of the municipal taxes collected from the tax payers of said City and County.

WHEREFORE, SAID PLAINTIFF PRAYS:

FIRST—That said Defendants by order of said Court be perpetually enjoined and restrained from allowing said claim of O'Connell & Lewis for said sum of $5250.62.

SECOND—That said Defendants by order of said Court be perpetually restrained from proceeding in the construction and completion of said Dome under said contract, as alleged herein.

THIRD—That said contract and all proceedings of said Board of New City Hall Commissioners in relation thereto, be decreed illegal and void and for such other and equitable relief as to the Court may seem just.

GALE & PEERY AND J. F. FLEMING,
Attorneys for Plaintiff.

The lawyers representing the City Hall Commissioners demurred to the complaint and Judge Slack has sustained the demurrer.

The question raised by the demurrer was whether the board has power under the act of March 24, 1876, to change the plans adopted so as to construct a tower and dome 150 feet high instead of a tower 250 feet in height.

In his decision Judge Slack says that the act of April 4, 1870, provides that the Commissioners shall adopt plans for the erection of a new city hall, the object being to provide a permanent building which in their judgment would be sufficient and suitable to accommodate the different departments of the city government.

Under this act Judge Slack holds that the adoption of plans for the erection of such a building as specified is confined to the judgment of the Commissioners. It is neither expressly nor impliedly contemplates that plans once adopted cannot be changed, and if during the course of construction the plans adopted were deemed unsuitable to the purpose of the commission they might in the exercise of their judgement change them.

When the act of March 24, 1876, provided for the creation of a Board of New City Hall Commissioners to take charge of the premises and proceed with the construction of the building "according to the plans heretofore accepted" or contemplated there was no change in the intent of the law. In considering the question upon which the complaint is based, "What was contemplated?" the answer is, "A permanent building sufficient and suitable to provide rooms for the departments of the city government."

If the present board, maintains Judge Slack, must proceed as contemplated it must furnish what the statute ordered and if charges are deemed neeessary the board has power to make them.

For these reasons the demurrer was sustained and Laver was allowed ten day in which to amend his complaint.

THE NEW GOVERNMENT ARCHITECTURE BILL.

IN the House of Representatives on June 16, 1894, Mr. McKaig introduced the following bill: (H. R. 7470) "To provide for the securing of plans and for the erection of the public buildings of the United States," which was referred to the Committee on Public Buildings and Grounds and ordered to be printed.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the President, by and with the advice and consent of the Senate, shall appoint a commission on public architecture consisting of three architects of high scientific and artistic attainment and large practical experience, and two officers of the Engineer Corps of the United States Army. If necessary, a separate appointment of any or of all three members of the commission who are architects may be made for each building under consideration, and members of the commission for one building may act upon other buildings. That the commission under the general direction of the Secretary of the Treasury shall discharge all the administrative duties relating to the procuring of designs and the appointing of architects for all buildings hereafter erected by the Government of the United States.

SEC. 2. That the Secretary of the Treasury shall be the president of the commission ex-officio, and the Supervising Architect of the Treasury Department shall be a member of the commission ex-officio. In the absence of the president of the commission one of the members shall be elected as chairman by ballot, and he shall preside at the meetings and perform such other duties as the rules of the commission may prescribe: and the Supervising Architect of the Treasury shall act as secretary of the commission.

SEC 3. That the Secretary of the Treasury shall convene the commission whenever in his judgment the exigencies of the service require it.

SEC. 4. That the commission shall adopt rules and regulations governing competition in the procuring of designs, and for the government of its meetings and the general performance of its duties. The members of the commission shall be paid their actual expenses and subsistence and a per diem allowance of ten dollars while actually engaged in the performance of their official duties, but no per diem allowance or salary shall be allowed to any civil or military officer on account of his being employed on the commission, but his actual traveling expenses and subsistence shall be paid while engaged thereon.

SEC. 5. That in case the limit of cost provided by law is one hundred thousand dollars or over, the commission shall select by ballot, for each building, five architects to prepare designs in competition; in case the limit of cost is less than one hundred thousand dollars, the commission may, in its discretion, select by ballot an architect without competition. No architect shall be eligible for entering as a competitor, or for appointment, who has not had at least ten years' experience as an architect-in-chief, and unless he can satisfy the commission, through work already done by him, or otherwise, that he is competent to take charge of the economical construction of the building. The commission shall cause to be made and issued to competing architects surveys, schedules of requirements for the building, limitations of cost, and all facts which might control or influence the character of the required design. The commission shall specify the number and character of the drawings required, and fix a definite time for their completion. The Secretary of the Treasury, upon the recommendation of the commission, shall pay to each unsuccessful competitor, to reimburse him for expenses incurred in preparing the competitive drawings, the following amounts: For designs for buildings to cost not more than one hundred and fifty thousand dollars, the sum of one hundred and fifty dollars, and for each and every one hundred thousand dollars of the limit of cost of the building above that amount, the additional sum of one hundred dollars; but in no case shall more than one thousand dollars be paid to any unsuccessful competitor.

SEC. 6. That the commis ion shall reject and return to the author any drawings which have failed to exactly comply with the requirements and regulations adopted by the commission for the competition, and no compensation for their preparation shall be paid, and the author thereof shall be debarred from all further participation in the competition. The commission shall carefully examine the drawings of each competitor in competition and shall select one design as the design of the proposed building, and shall recommend its author as the architect for that building and return forthwith all other drawings to their authors. The Secretary of the Treasury shall thereupon appoint the architect so recommended and he shall perform all the customary duties performed by an architect in private practice, namely: The making of all preliminary sketches, the modification of his design to meet possible requirements of the commission, the preparation of a set of general working drawings to procure estimates; the preparation of a set of general details on a larger scale, a set of full-size drawings for moulded, carved or ornamental work, and a set of all other original drawings and specifications required by the commission. He shall

supervise the construction of the building, and no payment shall be made to any contractor until the certificate of the architect has been received by the Secretary of the Treasury that the work has been executed in conformity with the contract. He shall file a complete set of the construction drawings in the Treasury Department, from which all duplicates shall be made, which duplicates shall be paid for out of the appropriation for the building. The architect shall be paid for his services a fee of five per centum upon the total cost of the work and the usual traveling expenses. The expenses of the commission and the fees of the architect shall be paid by the Secretary of the Treasury out of the appropriation for the building in the erection of which they were incurred.

SEC. 7. That the Secretary of the Treasury, upon the recommendation of the commission, shall authorize the architect to employ a competent clerk of the works, at a salary to be established by the commission, and he shall be paid for his services out of the appropriation for the building.

SEC. 8. That the Supervising Architect of the Treasury Department, under the direction of the Secretary of the Treasury, shall be the representative of the Government in all matters connected with the erection and completion of public buildings and the payment therefor. He shall receive proposals for the work and, with the approval of the architect of the building, he shall award the contracts therefore. He shall perform all other duties that now pertain to his office except such duties as are vested by this act in the architect of the building.

SEC. 9. That all acts and parts of acts inconsistent with this act are hereby repealed.—*The Inland Architect and News Record.*

ACOUSTICS IN ARCHITECTURE.

BY ALEX. F. OAKEY.

THE published contributions to the discussion of Acoustics in Architecture have not been hitherto sufficiently definite to establish even the basis for an exact science.

I would not underrate the labors of Mr. Scott Russell, Mr. T. Rodger Smith, M. Lachez, M. Savart and others; but it must be admitted that the contributions of these gentlemen are tentative and almost altogether analytic in method: attempts to account for success or failure by application of known acoustic phenomena to the conditions of existing auditoriums. In these attempts much valuable data in measurement and description of auditoriums has been accumulated, but the reasons alleged for success or failure in particular instances have been nullified by inconsistencies, made apparent by conditions in other instances.

Physicians will tell us that the essential step in medical treatment is a correct diagnosis, that it is futile to treat a patient for a paralysis superinduced by inflammatory rheumatism, when the real trouble is a little brain tumor on a nerve center near the fissure of Rolando. Intuitive perception may suggest lines of inquiry, but it is only by the most minute synthetic process that any reliable base can be established. The more we learn the more vague become the dividing lines between the sciences, until we are forced to realize with a sigh, that the thorough understanding of anything involves at least a general understanding of almost everything else.

With this conviction I undertook the study of the human ear, the human voice, the construction of musical instruments and of harmony, in the hope that such knowledge as I had already acquired, as an architect, of the nature of materials, of heating and ventilation, and other familiar matters, might, so supplemented, enable me to form a practical theory, and I have not been disappointed. Without the application of facts and deductions never sought for our uses, by such men as Professor Von Helmholtz, Professor Haweis, Dr. Mackenzie and many more, we would have to admit that the acoustics of halls and theaters are, as stated by a prominent actor and playwright, "notoriously and confessedly a matter of accident." This is the prevailing belief, even among architects, and few of them have made any serious attempt to remove the stigma. In explaining my own efforts to this end I would ask your indulgence for any seeming dogmatism, as we lack time for the arguments and reasoning that warrant my conclusions, but I shall make no assertion that you cannot verify at the cost of following carefully the line of inquiry I shall briefly describe.

It should be noted that an auditorium that is practically all that could be desired for speaking is not always acoustically satisfactory for music, as for instance, the lecture hall of the University of London; while an auditorium that is acoustically satisfactory for music is always satisfactory for speaking, like the little Chamber-Music Hall, in Leipsig. Hence only the musical requirements concern us, and these are not satisfied by mere hearing, in the sense that one may hear what occurs on the opposite side of a street, however exactly one may catch the least word of a conversation. The music lover must be physically in vibratory sympathy with the rendering. The capacity for this varies greatly, but for our purposes we choose a musically supersensitive mortal blessed, of course, with the positive ear. Let us examine this marvelous organ. It will repay our study, for it includes the most perfect music hall imaginable, in which the whole symphony of life is always and forever performing. This symphony, for the modern city denizen, is so horribly dissonant that if he is not rendered partially deaf his ear becomes jaded, like a hack horse, and is no longer capable of the finer sensibility. There is an analogy worth noting here: that a fine violin, constantly excited by the scraping of a mere fiddler, loses tone, and must be nursed and trained by a master to its natural responsiveness; and we shall have occasion to refer to this fact when discussing the properties of materials in their bearing upon our results.

For our present purpose we need not dwell upon the wonders and mysteries of the middle ear and the inner ear, though I would recommend the study if only to convince us that no broadax, happy-go-lucky method of probabilities can possibly serve in ministering to such a delicate constitution. The music hall I referred to is the external auditory canal, whose proportions and parabolic concavities, together with the nature and action of the membranes, present a hall in which any sort of sonorous vibration is sustained, increased or diminished, modified, or totally changed or instantly stopped, without possibility of confusion; and this chamber illustrates the essential principles of a fine violin, which, as you know, is a combination of parabolic reflectors with a common axis, the internal space, being in harmonic proportion, inclosed by different thicknesses and kinds of wood, the shapes and properties of each piece being determined by the nicest acoustic law.

We need not now further discuss the construction of the violin, though its minutest detail is of essential importance to us. I should occupy this convention for a week if I allowed myself anything more than a suggestive outline of various matters involved in the main question. It is important to state, however, that we are now with certainty making violins that lack nothing but age to equal the great Stradivaris, Amatis and Guarnaris. I need hardly say that a concert hall exactly like the auditory canal or the violin would not serve. I am talking of principles that are applicable to an infinite variety of conditions. The audience in the auditory canal is a single listener who never changes his seat and presents no absorbing surface, is contented to remain in darkness, and does not vitiate the air by breathing or perspiring. However, all these considerations have been

carefully weighed and reduced by actual, practical experiment to figures and formulæ, that can be handled and controlled with certainty. One vexing question especially has been eliminated by the introduction of the incandescent electric light. We can now avoid the stratification of the atmosphere into different densities, different degrees of heat and moisture, and, in short, so far as the conditions of the air itself is concerned, we can absolutely reproduce the ideal conditions of homogeneity of the auditory canal.

We know now how to supply oxygen with the due proportion of heat and moisture, and draw off from below, if necessary, in the riser of every seat, the carbonic anhydrate, ammonia, etc., and to give the whole body of air the desired movement toward the audience and upward to our heat vents. The necessity for proportionate measurements of an auditorium, if other evidence than is supplied by the ear and the violin is necessary, may be appreciated from the phenomena of the voice and those of the action of sound waves. If it is admitted that what we are striving for is to achieve such conditions, that what takes place in the auditory canal, in a violin, or in the mouth cavity of a great singer, shall, on a larger scale, take place in our auditoriums, it must also be admitted that the proportionate resistance of the body of air to be set in tremulous action in every direction must be determined with the same nicety that nature has taught us. An examination of Dr. Mackenzie's collection of casts of the mouth cavities of great singers is as suggestive and useful as the other inquiries I have touched upon. These forms, as might be expected, vary greatly, but the same principles of proportion and parabolic curvature prevail; but in these we are dealing with an instrument for producing sonorous vibrations, not an apparatus for measuring them, and it is instructive to note that the contralto or the soprano mouth cavity is distinct from the tenor or the baritone, and from each other, as much so as the length, size and other properities of the respective vocal cords, as also the quality and action of the respective lining membranes.

We must go back to the violin and to practical experiments based upon its functions to determine how and to what extent absorbent surfaces—especially those presented by an audience—interfere with our results; and how this interference shall be controlled and made an essential factor of success, as certainly as the stopping of a string on a fretboard. This has been settled by determining the amount of absorbent material, such as woolen fabric, that can be put into a violin without appreciably muffling the tone; and by corroborating the results of these delicate trials in actual experiments with audiences, curtains and other appliances in various rooms and halls, under various conditions. The results would seem to establish formulæ: That when the cubic space exceeds 325 feet per head, too great resonance need not be feared; on the contrary, every means of increasing resonance must be employed. As the proportionate cubic space is less than the above maximum figure, extremely resonant surfaces for walls and ceiling should be proportionately replaced by less and less resonant surfaces, until the conditions demand hard, non-resonant surfaces such as plaster throughout, when the minimum figure of 180 cubic feet per head is reached.

As to reverberation or echo, all possibility of such disturbance is obviated by the general form of the auditorium, which may be best described by a half-revolution of an obtuse parabola on its axis, the focus being on the floor line behind the last row of seats. You will ask how in the same auditorium the ideal balance of resonance can be preserved between very full, dense audiences and moderate or thin audiences? These varying conditions can be met by the simplest mechanical devices of pedals controlled by the occupation of the seats automatically, so that as the audience fills up the dampers act proportionately on area after area of surface. I am quite aware that the average manager may shrink at the possible expence involved in this, as in other essential precautions But why should we not take seriously the announcements we occasionally see that every precaution has been taken to insure acoustic success? These announcements are like the moral clauses in political platforms—admissions that there are enough intelligent people who think something of the kind should be accomplished to make the verbal concession advisable. As to arrangement of seating there can be no doubt that each row should be at least four inches higher than that in front, but I cannot find evidence to warrant insistance on a greater difference, for in a hall or theatre of approximately good acoustic properties, when the heating and ventilation are properly adjusted, the seats in the galleries are no better than those on the floor.

I will venture the assertion that if we will conscientiously construct a music hall on the principles we have mentioned, and construct our walls and ceiling in panels of wood of varying thickness and quality, the thinner and more easily excited sufaces being furthest from the voice or instrument, we can achieve results that shall insure a refinement of enjoyment hitherto unknown. Referring to the effect of careless, tuneless playing upon a violin, the effect upon a voice of persistently singing out of tune, compared with the effect of the opposite tasteful method, we can easily believe that some acoustic defects in auditoriums may grow worse with time as others may improve. As for remediable measures: Sounding-boards, stretching of wires, etc., we may admit that these and many other more radical prescriptions may be warranted by a correct diagnosis of the disease. I am inclined to think, however, that if the wires have ever done any good it was because accidently, by their varying tension, they supplied in a bungling way a similar apparatus to the rods of Corti of the inner ear, by which the physiologists are not yet agreed that we distinguish the quality of tones by measuring the over-tones. However this may be, of one thing I am certain, that all subdivisions of space, such as that under galleries, must be treated on the same principles as the main auditorium, and with the same nicety as to detail. That it is necessary to construct our ceiling, walls and floor with sufficient space behind, above or below, to insure the action of our resonant panels and that these spaces must not be mere waste spaces, but properly finished chambers, properly dry and ventilated. There are advantages in this from a practical view: that the main construction of the building is a thing apart, our hall is an apparatus, a sort of large ear with its own laws of being within.

We are possessed of the data for a book on the whole subject, a work that shall be exhaustive and final, to which we could turn for facts and formulæ with the same reliance that we use our engineers' pocket books for tests and strains. Such a work would be copiously illustrated and could not be less voluminous than Professor Helmholtz's "Sensations of Tone as a Physiological Basis for the Theory of Music." But where shall we find the devoted spirit who could, if he would, give three years of his life without hope of pecuniary reward, and where is the publisher who will invest the necessary thousands in so unpromising a venture?. In what I have said I have adopted the tone of positive assertion because I most potently believe what I have told you, and am warranted in so believing by the results of practical experiments. I could not in any less compass than a dozen courses of a dozen lectures of an hour or more each, have marshalled and reviewed all the facts, all the details, of investigation and the reasoning based upon these; and I have, therefore, thought best to flatly state my conclusions in the hope that they may excite discussion.—*World's Congress of Architects*

A SAD ACCIDENT ON MOUNT TAMALPAIS.

WM. Curlett, Jr., son of William Curlett, the architect, whose home is in this city, was killed by the accidental discharge of a rifle in the hands of Ralph Prescott.

Prescott is said to be wild with grief over the unfortunate affair, as young Curlett had been his friend for years. We cannot refram from offering our most heart felt sympathy to the family and friends of the young man.

A new law in the State of New York requires that all stone for Municipal and State buildings shall be cut, dressed and carved on the premises where used.

supervise the construction of the building, and no payment shall be made to any contractor until the certificate of the architect has been received by the Secretary of the Treasury that the work has been executed in conformity with the contract. He shall file a complete set of the construction drawings in the Treasury Department, from which all duplicates shall be made, which duplicates shall be paid for out of the appropriation for the building. The architect shall be paid for his services a fee of five per centum upon the total cost of the work and the usual traveling expenses. The expenses of the commission and the fees of the architect shall be paid by the Secretary of the Treasury out of the appropriation for the building in the erection of which they were incurred.

Sec. 7. That the Secretary of the Treasury, upon the recommendation of the commission, shall authorize the architect to employ a competent clerk of the works, at a salary to be established by the commission, and he shall be paid for his services out of the appropriation for the building.

Sec. 8. That the Supervising Architect of the Treasury Department, under the direction of the Secretary of the Treasury, shall be the representative of the Government in all matters connected with the erection and completion of public buildings and the payment therefor. He shall receive proposals for the work and, with the approval of the architect of the building, he shall award the contracts therefore. He shall perform all other duties that now pertain to his office except such duties as are vested by this act in the architect of the building.

Sec. 9. That all acts and parts of acts inconsistent with this act are hereby repealed.—*The Inland Architect and News Record.*

ACOUSTICS IN ARCHITECTURE.

BY ALEX. F. OAKEY.

THE published contributions to the discussion of Acoustics in Architecture have not been hitherto sufficiently definite to establish even the basis for an exact science.

I would not underrate the labors of Mr. Scott Russell, Mr. T. Rodger Smith, M. Lachez, M. Savart and others; but it must be admitted that the contributions of these gentlemen are tentative and almost altogether analytic in method: attempts to account for success or failure by application of known acoustic phenomena to the conditions of existing auditoriums. In these attempts much valuable data in measurement and description of auditoriums has been accumulated, but the reasons alleged for success or failure in particular instances have been nullified by inconsistencies, made apparent by conditions in other instances.

Physicians will tell us that the essential step in medical treatment is a correct diagnosis, that it is futile to treat a patient for a paralysis superinduced by inflammatory rheumatism, when the real trouble is a little brain tumor on a nerve center near the fissure of Rolando. Intuitive perception may suggest lines of inquiry, but it is only by the most minute synthetic process that any reliable base can be established. The more we learn the more vague become the dividing lines between the sciences, until we are forced to realize with a sigh, that the thorough understanding of anything involves at least a general understanding of almost everything else.

With this conviction I undertook the study of the human ear, the human voice, the construction of musical instruments and of harmony, in the hope that such knowledge as I had already acquired, as an architect, of the nature of materials, of heating and ventilation, and other familiar matters, might, so supplemented, enable me to form a practical theory, and I have not been disappointed. Without the application of facts and deductions never sought for our uses, by such men as Professor Von Helmholtz, Professor Haweis, Dr. Mackenzie and many more, we would have to admit that the acoustics of halls and theaters are, as stated by a prominent actor and playwright, "notoriously and confessedly a matter of accident." This is the prevailing belief, even among architects, and few of them have made any serious attempt to remove the stigma. In explaining my own efforts to this end I would ask your indulgence for any seeming dogmatism, as we lack time for the arguments and reasoning that warrant my conclusions, but I shall make no assertion that you cannot verify at the cost of following carefully the line of inquiry I shall briefly describe.

It should be noted that an auditorium that is practically all that could be desired for speaking is not always acoustically satisfactory for music, as for instance, the lecture hall of the University of London; while an auditorium that is acoustically satisfactory for music is always satisfactory for speaking, like the little Chamber-Music Hall, in Leipsig. Hence only the musical requirements concern us, and these are not satisfied by mere hearing, in the sense that one may hear what occurs on the opposite side of a street, however exactly one may catch the least word of a conversation. The music lover must be physically in vibratory sympathy with the rendering. The capacity for this varies greatly, but for our purposes we choose a musically supersensitive mortal blessed, of course, with the positive ear. Let us examine this marvelous organ. It will repay our study, for it includes the most perfect music hall imaginable, in which the whole symphony of life is always and forever performing. This symphony, for the modern city denizen, is so horribly dissonant that if he is not rendered partially deaf his ear becomes jaded, like a hack horse, and is no longer capable of the finer sensibility. There is an analogy worth noting here: that a fine violin, constantly excited by the scraping of a mere fiddler, loses tone, and must be nursed and trained by a master to its natural responsiveness; and we shall have occasion to refer to this fact when discussing the properties of materials in their bearing upon our results.

For our present purpose we need not dwell upon the wonders and mysteries of the middle ear and the inner ear, though I would recommend the study if only to convince us that no broadax, happy-go-lucky method of probabilities can possibly serve in ministering to such a delicate constitution. The music hall I referred to is the external auditory canal, whose proportions and parabolic concavities, together with the nature and action of the membranes, present a hall in which any sort of sonorous vibration is sustained, increased or diminished, modified, or totally changed or instantly stopped, without possibility of confusion; and this chamber illustrates the essential principles of a fine violin, which, as you know, is a combination of parabolic reflectors with a common axis, the internal space, being in harmonic proportion, inclosed by different thicknesses and kinds of wood, the shapes and properties of each piece being determined by the nicest acoustic law.

We need not now further discuss the construction of the violin, though its minutest detail is of essential importance to us. I should occupy this convention for a week if I allowed myself anything more than a suggestive outline of various matters involved in the main question. It is important to state, however, that we are now with certainty making violins that lack nothing but age to equal the great Stradivaris, Amatis and Guarnaris. I need hardly say that a concert hall exactly like the auditory canal or the violin would not serve. I am talking of principles that are applicable to an infinite variety of conditions. The audience in the auditory canal is a single listener who never changes his seat and presents no absorbing surface, is contented to remain in darkness, and does not vitiate the air by breathing or perspiring. However, all these considerations have been carefully weighed and reduced by actual, practical experiment to figures and formulæ, that can be handled and controlled with certainty. One vexing question especially has been eliminated by the introduction of the incandescent electric light. We can now avoid the stratification of the atmosphere into different densities, different degrees of heat and moisture, and, in, short, so far as the conditions of the air itself is concerned, we can absolutely reproduce the ideal conditions of homogeneity of the auditory canal.

We know now how to supply oxygen with the due proportion of heat and moisture, and draw off from below, if necessary, in the riser of every seat, the carbonic anhydrate, ammonia, etc., and to give the whole body of air the desired movement toward the audience and upward to our heat vents. The necessity for proportionate measurements of an auditorium, if other evidence than is supplied by the ear and the violin is necessary, may be appreciated from the phenomena of the voice and those of the action of sound waves. If it is admitted that what we are striving for is to achieve such conditions, that what takes place in the auditory canal, in a violin, or in the mouth cavity of a great singer, shall, on a larger scale, take place in our auditoriums, it must also be admitted that the proportionate resistance of the body of air to be set in tremulous action in every direction must be determined with the same nicety that nature has taught us. An examination of Dr. Mackenzie's collection of casts of the mouth cavities of great singers is as suggestive and useful as the other inquiries I have touched upon. These forms, as might be expected, vary greatly, but the same principles of proportion and parabolic curvature prevail; but in these we are dealing with an instrument for producing sonorous vibrations, not an apparatus for measuring them, and it is instructive to note that the contralto or the soprano mouth cavity is distinct from the tenor or the baritone, and from each other, as much so as the length, size and other properities of the respective vocal cords, as also the quality and action of the respective lining membranes.

We must go back to the violin and to practical experiments based upon its functions to determine how and to what extent absorbent surfaces—especially those presented by an audience—interfere with our results; and how this interference shall be controlled and made an essential factor of success, as certainly as the stopping of a string on a fretboard. This has been settled by determining the amount of absorbent material, such as woolen fabric, that can be put into a violin without appreciably muffling the tone; and by corroborating the results of these delicate trials in actual experiments with audiences, curtains and other appliances in various rooms and halls, under various conditions. The results would seem to establish formulæ: That when the cubic space exceeds 325 feet per head, too great resonance need not be feared; on the contrary, every means of increasing resonance must be employed. As the proportionate cubic space is less than the above maximum figure, extremely resonant surfaces for walls and ceiling should be proportionately replaced by less and less resonant surfaces, until the conditions demand hard, non-resonant surfaces such as plaster throughout, when the minimum figure of 180 cubic feet per head is reached.

As to reverberation or echo, all possibility of such disturbance is obviated by the general form of the auditorium, which may be best described by a half-revolution of an obtuse parabola on its axis, the focus being on the floor line behind the last row of seats. You will ask how in the same auditorium the ideal balance of resonance can be preserved between very full, dense audiences and moderate or thin audiences? These varying conditions can be met by the simplest mechanical devices of pedals controlled by the occupation of the seats automatically, so that as the audience fills up the dampers act proportionately on area after area of surface. I am quite aware that the average manager may shrink at the possible expence involved in this, as in other essential precautions But why should we not take seriously the announcements we occasionally see that every precaution has been taken to insure acoustic success? These announcements are like the moral clauses in political platforms—admissions that there are enough intelligent people who think something of the kind should be accomplished to make the verbal concession advisable. As to arrangement of seating there can be no doubt that each row should be at least four inches higher than that in front, but I cannot find evidence to warrant insistance on a greater difference, for in a hall or theatre of approximately good acoustic properties, when the heating and ventilation are properly adjusted, the seats in the galleries are no better than those on the floor.

I will venture the assertion that if we will conscientiously construct a music hall on the principles we have mentioned, and construct our walls and ceiling in panels of wood of varying thickness and quality, the thinner and more easily excited sufaces being furthest from the voice or instrument, we can achieve results that shall insure a refinement of enjoyment hitherto unknown. Referring to the effect of careless, tuneless playing upon a violin, the effect upon a voice of persistently singing out of tune, compared with the effect of the opposite tasteful method, we can easily believe that some acoustic defects in auditoriums may grow worse with time as others may improve. As for remediable measures: Sounding-boards, stretching of wires, etc., we may admit that these and many other more radical prescriptions may be warranted by a correct diagnosis of the disease. I am inclined to think, however, that if the wires have ever done any good it was because accidently, by their varying tension, they supplied in a bungling way a similar apparatus to the rods of Corti of the inner ear, by which the physiologists are not yet agreed that we distinguish the quality of tones by measuring the over-tones. However this may be, of one thing I am certain, that all subdivisions of space, such as that under galleries, must be treated on the same principles as the main auditorium, and with the same nicety as to detail. That it is necessary to construct our ceiling, walls and floor with sufficient space behind, above or below, to insure the action of our resonant panels and that these spaces must not be mere waste spaces, but properly finished chambers, properly dry and ventilated. There are advantages in this from a practical view: that the main construction of the building is a thing apart, our hall is an apparatus, a sort of large ear with its own laws of being within.

We are possessed of the data for a book on the whole subject, a work that shall be exhaustive and final, to which we could turn for facts and formulæ with the same reliance that we use our engineers' pocket books for tests and strains. Such a work would be copiously illustrated and could not be less voluminous than Professor Helmholtz's "Sensations of Tone as a Physiological Basis for the Theory of Music." But where shall we find the devoted spirit who could, if he would, give three years of his life without hope of pecuniary reward, and where is the publisher who will invest the necessary thousands in so unpromising a venture? In what I have said I have adopted the tone of positive assertion because I most potently believe what I have told you, and am warranted in so believing by the results of practical experiments. I could not in any less compass than a dozen courses of a dozen lectures of an hour or more each, have marshalled and reviewed all the facts, all the details, of investigation and the reasoning based upon these; and I have, therefore, thought best to flatly state my conclusions in the hope that they may excite discussion.—*World's Congress of Architects*

ILLUSTRATIONS.

The management of this journal desires to extend a cordial invitation to all architects on this coast and elsewhere to contribute designs for publication.

Drawings should be made with perfectly black lines on a smooth white surface. Good tracings, if made with black ink, answer the purpose.

The designs selected will be published without charge. All drawings, whether accepted or not, will be returned to their authors, who must bear express charges both ways.

PRESENTATION OF THE ROYAL GOLD MEDAL TO SIR FREDERICK LEIGHTON, BART., P. R. A. [H. A.], MONDAY, JUNE 25, 1894.

ADDRESS BY THE PRESIDENT, FRANCIS C. PENROSE, M. A., F. R. S., F. R. A. S., KNIGHTS OF THE ORDER OF THE SAVIOR IN GREECE.

COLLEAGUES AND GENTLEMEN:—

E have before us this evening a grateful task, and one in which I feel it to be a high privilege to take a share, in presenting, in the name of our Most Gracious Patron, Her Majesty the Queen, the Gold Medal to one who has greatly honored us by accepting it at our recommendation. The distinguished President of the Royal Academy is well known to all of us here by his works and by his renown, to many by his friendship, and his genial courtesy to all who have had any intercourse with him.

As it is possible that some one who has not sufficiently followed the considerations which have guided the Institute in this award might ask, Why should a medal intended for the recognition of architectural merit be awarded to a painter? I propose addressing myself briefly to that point by-and-by; but, in the first place, I will endeavor to trace shortly some of the steps by which our distinguished friend has attained the highest eminence in our British world of Art.

Sir Frederic Leighton was born at Scarborough, and his natural inclination towards the graphic arts early declared itself. His father, a physician, though he had other views for his son—intending, it is said, to give him a University education, with a view to his ultimately being called to the Bar—nevertheless encouraged him to make himself acquainted with anatomy, and gave him every facility for the study of art in order that he might be equipped for the profession should he eventually follow it. We early find him, then studying at Rome; and, if I may be allowed a moment's digression, this leads me to reflect that I must occasionally have fallen in with him during the winter and spring months at the Artists' excursion called the Cervara, or on the Pincio or when it was the ambition of the British art students who were there to fall in with John Gibson at his early coffee at the Lepre.

Dr. Leighton became so far a convert to his son's wishes as to consent that the latter's drawings should be submitted to the famous American, Hiram Power—a man not less remarkable for his great skill as a sculptor and his knowledge of art, than for his noble physique, his courteous manners, and his sterling character—and if he decided that there was the true artist's ring about these works, his son should no longer be opposed in following the bent of his inclination. We may, I think, appreciate the pleasure which the good American had in assuring the father that there could be no doubt whatever on the subject. The pithy way in which old Hiram Power gave his verdict is worth recording: "Then you think," said Dr. Leighton, "I ought to let my son be an artist?" to which there came the answer: "You have no choice, sir; Nature has done that already." After this, the youthful painter studied in various European centres, and made himself proficient, not only in the art of the countries in which he sojourned, but also in the languages, as those who have heard his discoursing with foreigners can testify. At Brussels, when eighteen years of age, he produced his first finished picture, "Cimabue finding Giotto in the 'Fields.'" He shortly afterwards showed his sympathy with our profession by a painting of which the subject was the death of Brunellesco. After some residence in Paris, working at the Louvre, he studied at Frankfort under the painter Steinle, to whom he submitted the design of his magnificent picture "The Triumph of Cimabue," which he carried out at Rome. I have heard that during this period Thackeray fell in with him, and prophesied that, although as yet altogether unknown in England, he would become President of the Royal Academy.

The great picture above referred to was sent to England for the Exhibition of 1855, then held in the rooms of the present National Gallery. The seniors here present can remember, and many of the juniors who saw the picture when it was exhibited again at Manchester can well understand, the fervour which was created on all sides by the unexpected appearance of such a work by a man hitherto unknown. The picture was immediately bought by the Queen. But, for the present renouncing what might have seemed a lucrative opportunity for accepting work in London, he returned to his studies, and resided for some years on the Continent, chiefly in Paris, in communication with some of the most distinguished painters of that capital.

Soon after his return to England, he painted the fine fresco representing "The Five Foolish Virgins," in the church at Lyndhurst, in the New Forest; and in the same material, but more recently, two large fresco paintings at the South Kensington Museum, representing the Industrial Arts applied to Peace and War.

It is, however, impossible, in the space here available, to enumerate anything like a list even of his principal paintings.

"The Power of Music" was exhibited in 1856. The great classical subject of "Hercules Wrestling with Death for the Body of Alcestis" must be specially mentioned, for it called forth the praise of his friend Browning in the poem called "Balaustion's Adventure":

> I know, too, a great Kaunian painter, strong
> As Herakles, though rosy with a robe
> Of grace that softens down the sinewy strength,
> And he has made a picture of it all.

More lately we have seen the fine, pathetic picture of Andromache, *dejectan conjuge tanto*, in her captivity. In 1881 the merited compliment was paid him in the request from Italy that he should contribute his portrait to the gallery of di-

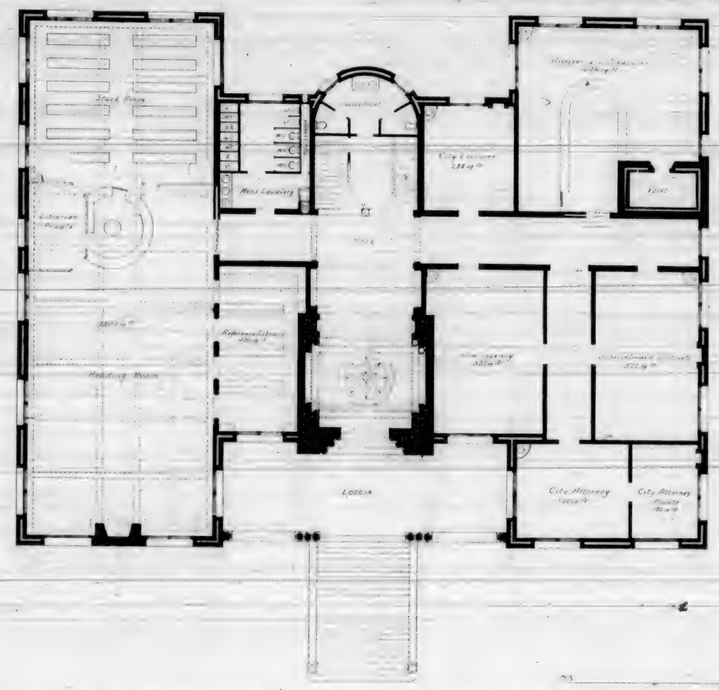
tinguished painters in the Uffizi at Florence.*

Thus far we have followed his career as a painter; but, not content with the triumphs of his brush, he has invaded the sculptor's domain. In 1877 we admired the fine group of the "Athlete Struggling with a Python," and in 1886 his bronze statute of the "Sluggard." I shall presently have to speak of his potential claim to graduate in architecture.

I necessarily omit much. Of him it can without exaggeration be said, *Nihil tetigit quod non ornavit*. Up to 1883 he had for many years, as their Colonel, led the Artists' Corps of Volunteers. His eloquence in presiding at the Royal Academy Dinners is the theme of all. The social side of his character is equally admirable, and many are those who can bear witness to generous actions on his part, both in purse and kind sympathy.

But Sir Frederic Leighton is very much more than a painter. He is the only President of the Royal Academy, from the time of its first foundation, of whom it can with certainty be said that he has evinced a thorough knowledge of all the great Arts, and who is practically great as a painter, a sculptor, an orator, and a writer.

The greatest master in Art since the days of Pericles is reported to have said, "I know but of one Art." There have been but few who could justly adopt those words, but but one of those few is Sir Frederic Leighton. Similar to its tripartite analogy in Nature, where length, breadth and thickness form one space, so architecture, sculpture and painting are one in Art; the practice is different, but the principles, whenever excellence is touched, are found to be the same in each branch. You know Sir Frederic Leighton's



ACCEPTED DESIGN FOR THE ALAMEDA COUNTY COURT HOUSE.

I do not suppose there is anyone in this room who questions that the Institute has been thoroughly right in making the award of this medal which we have the happiness of bringing to its consummation to-night; but, as I said before, in case there should somewhere be a doubter, I will make a few remarks on that head. Had Sir Frederic Leighton no other claims upon us than the noble architectonic works that have often been products of his hand, works many of them in oil and fresco, executed for the embellishment of public and private buildings, the Institute would have a perfectly good answer to give. The late Prince Consort thus defined the ruling principle—namely, that the appropriation of the Gold Medal should be left an open question to be raised according to circumstances in each year, and to be applied as the Council might periodically feel to be the best for the general interests of the profession. The Institute would therefore be justified in awarding the medal to an artist of high distinction either as a painter or sculptor.

* The dates of the principal steps of Sir Frederic Leighton's advancement are these:—Associate of the Royal Academy, 1864; Royal Academician, 1869; President, 1878. In the last-named year he was knighted, and in 1886 created a Baronet. In France he is an Associe Etranger of the Institut (Academie des Beaux-Arts) and a Commander of the Legion d'Honneur. In Germany the rare distinction of Frederick the Great's "*Ordre pour le Merite*" has been conferred on him—an honor accorded to very few.

high achievement in sculpture. In architecture there is the clearest evidence of what I have called his potential merit had he had occasion to practice in our special branch.

In biennial Addresses to the Students of the Royal Academy, particularly in the years 1889, 1891, and 1893, we find criticism of the highest value clothed in beautiful language on the Spanish, French and German Schools of Mediæval Architecture. Not mere sketches and generalizations, but dealing with the subject in an exhaustive manner.

Our ex-President has most happily and justly eulogised these addresses, saying in his discourse to students at the beginning of this year that they demonstrate in regard to architecture that their writer possesses an intelligent and a critical grasp of the subject second to no modern author. To few indeed is it given to combine with wide historical research and keen critical acumen the indescribable charm of composing poetry in prose. Let me command to your thoughtful attention the study of these singularly learned and graceful discourses.

That an artist of such refinement would also be in sympathy with the spirit of classical architecture will not be doubted. I had myself frequent opportunities of bearing witness to his appreciation of the elements of beauty in the

works of the Greeks at meetings of the Publication Committee of the Society of Dilettanti; but I wish particularly to call your attention to the masterly summaries of the characteristics of Mediæval architecture as practised by the leading races of Continental Europe in the Academy lectures before referred to. The whole series is full of practical teaching in clear and incisive language: but as in this address limitation is necessary, I will confine myself almost entirely to what is said on the evolution of Gothic architecture from its source at Saint-Denis. After a short discussion of the earlier manner of vaulting from the Roman type, in which stability for the wagon vault was sought in the resistance of solid masses of brick and concrete work, we read:—

"The substitution of the principle of a balance of active forces to this principle of inert resistance is probably the greatest revolution ever introduced in the science of building: we have here the generative principle of Gothic architecture, its essence and its life. How this revolution was brought about I can of course only indicate to you in summary outline. Let us first note in passing that the presence of a pointed arch, except as a structural form, does not constitute Gothic architecture. Isolated radiating pointed arches have been built in ages and countries in which the Gothic style was not dreamt of; a building might be Gothic in structure and principle without showing a point opening anywhere: it is through the roof, not through the window, that the formative Gothic idea entered."

Then after describing various expedients for securing stability, including the important step taken at Vezelay, where intersecting vaults, but without ribs, were substituted for the continuous wagon-head—an advance, but not yet satisfactory—we read: "A few years later, in the early middle of the twelfth century, a Benedictine monk, feeble of frame, but of a lofty spirit, sugar, the great Abbot of Saint-Denis—who has no sculptors, by the bye, this special claim, that he boldly withstood the bitter denunciations launched by St. Bernard against the sculptural decoration of churches—began the erection of a church in which the tentative groupings, at which I have hinted, gave place to the systematic and logical application of a new and fruitful conception—the idea of stability based on the balance of active forces, expressed in a self-sustaining combination of upright supports and vaulting ribs, with detached buttresses bringing their action to bear exactly on the points at which the trust of the vaults is gathered up."

The address concludes: "Is there any lesson that we may draw from this hurried survey of artistic evolution amont the French? I have dwelt with emphasis on the genius o their Mediæval builders; do I advocate—the young architects for whom I nave mainly spoken to-night may ask—d I advocate the adoption of Gothic forms for the purposes o our own lives? I have spoken to little effect if my answe can be doubtful. Artistic forms are the vesture of ideas and the expression of mental conditions; the ideas and mental conditions of our day are widely removed from those of the Middle Ages; the modern mind cannot with fitness put on the garb which was moulded on the mind of a day long past. But if we may not fitly adopt those forms, we cannot too reverently note the spirit which presided over their development, for a like spirit brought to bear on other material and under other conditions may yet bear new and noble fruit. And the characteristics of that spirit are—a masculine independence, a tenacious grasp of central principles, a fearless sincerity in expression, a scorn of shams and trust on truth."

In Sir Frederic's address for last year we find admirable criticisms on the German Mediæval architecture; praise where due is given to the German Romanesque, and afterwards the reflection, which appears to me perfectly just, that the Germans as a race were never in unison with Ogival architecture; and in respect to their great achievement—Cologne Cathedral—though not withholding praise, he observes, as I think most truly: "We feel that we are in the presence and under the spell of a powerful will, grasping serenely and solving with unfailing and intellectual resource a scientific problem; we bow accordingly before a triumph of skill and volition, we are not, as it seems to me, thrilled by the kindling touch of genius."

To the pictorial works by Sir Frederic Leighton in connection with architecture already named may be added paintings for the ceilings of a house at New York, of which our Gold Medalist, Mr. Richard M. Hunt, was architect, as well as several of the same character in London. But I must specially mention one work combining architecture in the solid with which he has had much to do. I allude to the removal of Alfred Stevens' monument from the south chapel in St. Paul's to the nave for which it was originally designed, which was done entirely under his inspiration and in no small degree at his expense. I feel sure that there can be no need for me to dilate further on what seems to require no argument in justification of the action of our ex-President and of the Council, and of the Institute which has ratified their action in awarding this medal, especially when, to the great advantage of the Institute, Sir Frederic Leighton's acceptance of its sheds lustre on the roll of Gold Medalists, so well begun with the loved and honored name of Professor Cockerell; and it must be obvious to all of us that the whole profession gains from the fact that the chief representative of Art in its three branches in this country thereby shows how much he is in sympathy with Architecture.—*Journal of the British Institute of British Architects.*

BOOKS AND PERIODICALS.

THE ARCHITECTS' DIRECTORY for 1894. This valuable reference book to the architectural profession has just appeared from the press of Wm. T. Comstock. It is put up in convenient shape and bound in red boards with gilt stamp, making quite a striking appearance. The work bears marks of very careful preparation and aims to give, classified by States and towns, all the architects in practice in the United States and Canada. In giving architects' names the membership in the architectural societies is indicated by figures in brackets following each name; (1) indicating membership in the American Institute of Architects; (2) the Architectural League of New York; (35) Royal Canadian Academician. This will be found a valuable feature, not only interesting to architects, but to those following up the work of associated architects. The influence of architectural associations in raising the standard of architecture in this country is well known, and this feature of the Directory will be regarded important.

The work is well made up, clearly printed and of convenient size, and will be found of great value to architects and the building trades. The price is one dollar.

THE BUILDERS' PROGRESS and PACIFIC ARCHITECT.—This is the title of a new paper published every Saturday by P. J. Donohue at 309 California street. Its mission is to gather from every quarter such news as will most interest interestrthosc who are about to build, a directory of architects on the Pacific Coast, with a list of contractors and material men together with other matter useful to all to those interested in building, and want to know where to lay their hands upon what they want for that purpose. We hope that the publisher may receive all the encouragement he wants in placing his new venture before the public.

The convention number of the PHOTOGRAPHIC TIMES for July 20th, arrived at hand too late for a notice in our last number. Though much was promised for the convention number, none need be disappointed in what proves to be a great success; with "The Old Fashioned Girl" with her spinning wheel for a commencement, to the end of the number the illustrations are life like and striking. The Hand Camera in the Streets by Walter D. Welford give many hints of what the camera is capable of in the way of

street views is well illustrated by the two pictures entitled "An Interesting Moment" and "Shopping on a Wet Day."

The work, however, must be seen and read to be fully appreciated.

"WORKING-CLASS SETTLEMENTS IN MULHOUSE AND MILAN" is an article giving an account of the great success of what we should call building associations, though having a much more comprehensive plan of operations, than our building associations and according to the account given have proved very successful; the author calls the *Societe Industrielle* "a sort of Royal Institution and philanthropic society rolled into one." Resulting in good house, cheap rents with comfort and happiness to all. What more can be asked for?

THE FORTNIGHTLY REVIEW for July 1894, is of unusual interest; one article "A Lesson from Chicago" should be read by all who have a love for our American Navy. This article though addressed to British readers is very complimentary to the ships built for Our Navy.

LIPPINCOTTS' MAGAZINE for August, 1894, comes to hand with a novel call "Sweetheart Manette," by Maurice Thompson; while Louise Stockton's tale "A Mess of Pottage" is concluded, "Uncared for Cats" as well "Feminine Phases" are both full of fun and humor, while "Washington Before the War" by Mrs. M. E. W. Sherwood supplies many interesting reminiscences of that interesting period.

CORRESPONDENCE SCHOOL OF MECHANICS. It has become a common thing to have schools established for instructing by correspondence, we have received a little leaflet from "The Colliery Engineer Co." Scranton Pa., containing extracts from letters from students who have taken a course in "The Correspondence School of Mechanics" all appear to be much pleased with the progress made in the department selected for study and offer many reasons why they could not avail themselves of any other method of instruction.

PACIFIC MEDICAL JOURNAL for August 1894, published from 603 Sutter street, Winslow Anderson, M. D., editor and publisher. This is a handsome magazine, well printed on good paper; we should judge it must be of interest to the medical profession as every thing relating to good health is of interest to the public at large we trust the circulation of this magazine may continue to be everything that the publishers may desire. An interesting article entitled "Some Things Noticed on a Trip to the Eastern States" cannot fail of having many readers both of the professional and non-professional class.

GEO. P. LOW, Pres. C. O. POOLE, Vice-Pres.
MAX CASPARI, Sec. H. T. BESTOR, Treas.

LEGAL DECISIONS.

From a large number of Legal Decisions of the higher Courts of the different States of the Union, we select and publish in this column, such as appear applicable to this section of the country.

MONEY PAID FOR ANOTHER'S USE.—Where a contractor on a building abandons the work, leaving the workmen unpaid, and the owner tells the contractor's bondsmen that there is enough money coming on the contract to complete the building, and directs him to pay the workmen, so that the work shall go on, and says that he will refund the money so paid as for money paid to and for his use.

Dibble v. Demattos, Supreme Court of Washington, 36 Pac. Rep. 485. 79.

RIGHT OF MORTGAGEE TO BUILDING REMOVED FROM MORTGAGED LOT.—Where the owner of a lot and building thereon, mortgaged the same the mortgager subsequently sold the said premises subject to such mortgage. Afterwards, the purchaser, without the knowledge or consent of the mortgagee, removed the building to another lot, owned by his wife. Neither the severance of the building nor its annexation to another lot destroyed the right of his mortgagee to enforce his claim against it, the lot mortgaged being first exhausted. After its removal to her lot, the wife made certain additions to and improvements upon the building. The improvements and additions so made in this case, did not destroy the identity of the mortgaged building, or defeat the mortgagee's right to subject it to the payment of so much of his mortgage debt as remained unpaid after exhausting the mortgaged lot.

Dakota Loan & Trust Co. v. Parmelee, Supreme Court of South Dakota, 58 N. Y. Rep. 811. 143.

WHERE AN EMPLOYE IS VICE PRINCIPAL.—One employed by the architect of a building to construct the scaffolds upon which the bricklayers and hod carries shall work is, in the construction thereof, a vice principal, and not a fellow servant of a hod carrier.

McNamara v. MacDonough, Supreme Court of California, 36 Pac. Rep. 941. 44.

EFFECT OF ALTERATIONS AND ADDITIONS IN BUILDING CONTRACT.—When additions are made to a house in course of erection, which a contract has agreed to build for a certain sum, the original contract still exists so far as it can be traced, and the excess is to be paid for according to its reasonable value; and it is only where the charges have been so great that it is impossible to follow the original contract, that it will be deemed wholly adandoned, so that the contractor can recover on a basis of value. When such contract is shown to have existed, the burden is upon the party claiming its abandonment to prove the same.

Hood v. Smiley, Supreme Court of Wyoming, 36 Pac. Rep. 856, 112.

WHAT CONSTITUTES FELLOW SERVANT.—Where a foreman in erecting a scaffold, builds it in a negligent manner, and an employe under him is injured by such defective scaffold, the foreman is a fellow servant and the master is not liable.

Noyes v. Wood, Supreme Court of California, 36 Pac. Rep. 766. 38.

EFFECT OF ABANDONMENT BY CONTRACTOR.—A building contract provided that the last installment of the price should be paid when the building was completely finished and accepted, and that no payment should be made until the contractor should procure from the county clerk a certificate that "no liens or claims have been recorded or filed against said premises or building, which are then unsatisfied of record." Where the work was abandoned by the contractor, and finished by the owners, an assignee of the final payment to become due the contractor could not recover without producing such certificate.

Bates v. Trustees of Masonic Hall and Asylum Fund, Supreme Court, Special Term, Oneida County, 27 N. Y. Supp. 951. 97.

WHAT CONSTITUTES USE OF PARTY WALLS IN COMMON.—Where a wooden warehouse is framed against a brick wall, built one half on each lot, though no joists or other timbers are let into the wall, yet, if the ends of the sides and the roof are attached thereto in a permanent manner, and the wall used as one side of the enclosure, there is a use in common which entitles the owner of the wall to recover from his neighbor for his use, and half the value of such party wall.

Deere Wells & Co. v. Weir Shugart Co., Supreme Court of Iowa, 59 N. W. Rep. 255. 85.

BUSINESS MOSAICS.

Schenck's Swinging Hose Reel for Mills, Factories, Hotels and Public Buildings. This reel has many advantages for inside protection, from the fact it is simple, safe and reliable in construction, and always ready for use, having packing boxes that never leak. Sold only with the hose the couplings and hose pipe complete, it is fully guaranteed. Reduce your insurance by having the best protection. W. T. Y. Schenck, 593 Mission near Second.

Boston Street Car Conductor.—"How old are you my little girl?" LITTLE GIRL—"If the corporation doesn't object I prefer to pay full fare and keep my own statistics."—*Chicago Standard.*

Mantels, Grates and Tiles.—No matter how well your house may be built, if you have not proper heating apparatus you will never be satisfied with it, therefore if you are wise you will call upon W. W. Montague & Co., before giving your orders in this line. This house has establishments in San Jose and Los Angeles in addition to their headquarters in this city. Your wants will be well supplied either with artistic work in bronze, or the common every day out-fit for the kitchen, all good of its kind. See advertisement in this journal.
